- ☐ Protect the existing public investment in surface transportation assets through a commitment to retain the physical integrity of major elements of the surface transportation system – roads, bridges and public transportation and their essential components.
- ☐ Promote the more efficient use of urban and suburban transportation facilities through traffic operations improvements and incident management.
- ☐ Provide positive incentives to increase the use of high-occupancy, ride-sharing and transit services and non-motorized modes, in an effort to reduce peak period single occupant vehicle use.
- ☐ Consider effective approaches in highly congested urban and interregional corridors to supplement basic mobility with transportation options that offer premium, specialized or alternative mode services.

- ☐ Apply the test of cost-effectiveness to all major capital improvements and include design guidelines which will promote transportation productivity and reduce life cycle costs.

Freight and Passenger Intermodalism

- ☐ Address the increasingly intermodal aspects of international, interregional and urban transportation on an integrated basis including passenger and freight linkages to business/distribution hubs, railheads, ports, and airports.

- ☐ Enhance the productivity of freight transportation while preserving equitable cost-allocation among highway users and minimizing adverse safety and community impacts.

- ☐ Improve regulatory uniformity regarding freight operations through cooperative, coordinated efforts among federal, state and local governments under guidelines which provide the maximum feasible access to labor pools, markets, and areas of production consistent with safety.

Safety

- ☐ Increase capital investment in safety-related measures while giving greater consideration to safety in planning, design and rehabilitation including development of reasonable standards, and focus additional resources on education and enforcement at all levels of government.

Economic Development

- ☐ Emphasize highway and public transportation investments – urban and rural – with direct economic development benefits related to business services, industrial, agricultural and resource development, and international competitiveness.

- ☐ Encourage development of federal lands, metropolitan and rural facilities with potential to be parkways, scenic byways or provide connecting links to recreational resources.

- ☐ Encourage financing of transportation improvements by beneficiaries in relationship to their potential benefits.

- ☐ Recognize that a strong cooperative regional focus is essential to identify, maintain and develop the transportation systems required to attract and direct future economic development.

Community and Environmental Concerns

- ☐ Encourage coordinated land use development patterns and management policies at both the state and local levels that support cost-effective transportation investments and provide for more balanced, less disruptive growth.

- ☐ Develop long-term comprehensive transportation supply, demand and technology strategies that are compatible with the attainment of air quality goals and also meet mobility needs.

- ☐ Facilitate implementation of essential transportation networks in developing areas through advanced land use planning to identify and preserve local rights-of-way and new public/private mechanisms to facilitate early acquisition.

Defense

- ☐ Review highway and intermodal requirements for rapid national defense deployment and mobilization.

Technology Development and Research

- ☐ Focus and coordinate research and development efforts on a new generation of efficient vehicle and guideway technology – materials, design, operations, controls, and driver information systems.

- ☐ Develop incentives and training to support the widespread and consistent application of the best available technology to improve transportation systems efficiency and effectiveness.

INVESTMENT LEVEL AND SOURCES

This category includes basic directions related to investment level and sources implied by the program orientation. It addresses the overall financial requirements, the sources of funds and treatment of existing funding programs.

Investment Level

- ☐ Establish a long-term commitment to be shared by all levels of government and the private sector to an increased level of investment sufficient to maintain the value of the existing surface transportation assets, to meet essential future needs, and promote national economic growth and productivity.

Existing Funding Programs

- ☐ Maintain the capacity to fund surface transportation adequately by prohibiting the use of federal fuel tax revenues or other tax revenues funding the federal Highway Trust Fund for deficit reduction or other non-transportation purposes.

- ☐ Fully commit trust fund revenues to transportation up to their authorized levels and spend down trust fund balances in a responsible incremental fashion.

- ☐ Periodically review the taxes supporting the user-fee system to assure they remain sensitive to travel demand, and to ensure funding integrity in the face of inflation and changes in vehicle and fuel technology.

- ☐ Improve the predictability and stability of the federal-aid financing process through multiyear capital budgeting or other mechanisms.

- ☐ Support development of alternative fuels by means that do not negatively affect Highway Trust Fund revenues.

Sources of Funds

- ☐ Make provision at the federal, state and local level – both tax and programmatic – to permit utilization of a wider range of user and non-user funding sources and private sector involvement to support increased transportation investment.

- ☐ Recognize that specific furtherance of social and environmental benefits warrants continuation of general fund support for transportation investments at all levels of government.

INTERGOVERNMENTAL ROLES

The basic directions related to intergovernmental roles address the appropriate functions of each level of government, changes in intergovernmental program relationships, and resource distribution modifications.

Level of Government Focus

- ☐ Continue federal-aid program focus on specific areas of national interest including interstate mobility, metropolitan and rural regional mobility, safety, research, and technical support.
- ☐ Enhance the role of local government in the planning, financing, and decision-making process with regard to the expenditure of state and federal transportation funds.
- ☐ Rebuild the nation's technological leadership in surface transportation with a renewed emphasis on research, development and training through an expanded federal and state R & D program and new federal, state, local, private and institutional partnerships.
- ☐ Recognize that providing transportation to the nation requires a partnership between government and the private sector, and encourage intergovernmental and private sector cooperation on transportation programs.

Program Management Changes

- ☐ Increase the discretion of state and local partners through simplification and consolidation of selected categorical programs, increased transferability, and streamlined certification and audit procedures.
- ☐ Reduce federal non-transportation mandates, and develop more flexible and cost-effective means of meeting national priority goals.
- ☐ Equalize the tax treatment of employer-provided commute-to-work fringe benefits to minimize modal bias.
- ☐ Improve the effectiveness of the metropolitan and rural regional multimodal planning and programming process.
- ☐ Provide the increased program flexibility and discretion necessary to encourage institutional innovation at the state, regional and local level including new intermodal, interagency and public/private cooperation approaches to emerging urban and suburban mobility problems.

38-253 O—91——32

Resource Distribution

- ☐ Provide for simplified distribution of federal-aid funds on a basis that is responsive to need, balances a recognition of system considerations, regional differences and equity concerns.

- ☐ Consider adjusting state and local matching requirements in proportion to the degree of state and local discretion and stringency of federal mandates and in response to local efforts and fiscal capacity.

TAG SUPPORT

Many firms and individuals contribute time, expertise and funds to the Transportation Alternatives Group (TAG). This support has given the TAG consensus process the essential direction, momentum and vitality over the program's first two years. Supporters include not only the twelve TAG members (see inside front cover) but all those others making financial contributions and those who serve on the 55-member Chairman's Advisory Council.

Financial Contributions (other than those from the TAG members) have been made by the following:

SPONSORS ($5000 or more) • American Road & Transportation Builders Association • American Traffic Safety Services Association • Ashland Oil Foundation • Asphalt Institute • Associated Equipment Distributors • Associated General Contractors • Construction Industry Mfgs Association • Dean Witter Reynolds • Eno Foundation for Transportation • Figg & Muller Engineers • First Boston Corporation • Institute of Transportation Engineers • International Bridge, Tunnel, Turnpike Association • Martin Marietta • Minnesota Mining & Manufacturing • National Asphalt Paving Association • National Electrical Mfgs Association • National Stone Association • Paccar Foundation • Phillips Petroleum Foundation • Portland Cement Association • United Parcel Service Foundation • Vulcan Materials

PATRONS ($2,000 - $4,999) • Alfred Benesch & Co. • American Consulting Engineers Council • American Society of Civil Engineers • CH2M Hill • Daniel, Mann, Johnson, Mendenhall • Kimley-Horn Associates • Michael Baker Consultants • National Coal Association • Parsons, Brinckerhoff, Quade & Douglas • Rockwell International • Shearson, Lehman, Hutton • STV Engineers • Travel Industry Association of America • Urban Land Institute • Wade-Trim Group • Wilbur Smith & Associates

DONORS ($500 - $1,999) • American Institute of Steel Construction • Bechtel Foundation • Centennial Engineering • DeLeuw, Cather Consultants • Edwards & Kelcey • Fluor Foundation • Geico Foundation • Institute of the Ironworking Industry • Kidde Consultants • Maguire Group • National Grange • National Private Truck Council • National School Transportation Association • Salt Institute

TAG CHAIRMAN'S ADVISORY COUNCIL

The Council was organized to provide liaison with other disciplines and industries beyond the TAG membership. The Council represents various modal interests, professional transportation groups, user organizations and others. This document incorporates suggestions made during the CAC review process. The Council membership currently includes:

Deborah Lunn, Airport Operators Council International • Steve Stiles, American Association of Retired Persons • Eric Stromberg, American Association Of Port Authorities • Susan Perry, American Bus Association • Howard Messner, American Consulting Engineers Council • George Berg, American Farm Bureau Federation • George Marcou, American Planning Association • Peter Ruane, American Road & Transportation Builders Association • Albert Grant, American Society Of Civil Engineers • Robert M. Garrett, American Traffic Safety Services Association • H.M. Zachem, Ashland Oil, Inc. • Gerald S. Triplett, Asphalt Institute • Sandra Spence, Association For Commuter Transportation • Tony Obadal, Associated Equipment Distributors • Dave Lukens, Associated General Contractors • William Wilkinson III, Bicycle Federation of America • Ted Hackworth, City & County of Denver • William Peterson, Construction Industry Manufacturers Association • Calvin Grayson, Council of University Transportation Centers • Roland Ouellette, ENO Foundation • Bill Dickhart and Henry Schrader, High Speed Rail Association • Thomas Brahms, Institute Of Transportation Engineers • Neil D. Schuster, Intl. Bridge, Tunnel, & Turnpike Association • Jack Kinstlinger, Kidde Consultants, Inc. (representing the American Consulting Engineers Council) • Andy Clarke, League Of American Wheelmen • Steve Zelnak, Martin Marietta Aggregates • Robert Winick, Maryland National Capital Park/Planning Commission • Andrew Lampe, Minnesotta Mining and Manufacturing Company • Harriett Parcells, National Association of Railroad Passengers • John Gray, National Asphalt Paving Association • Milton L. Johnson P.E, National Association of County Engineers • Richard L. Lawson and Joseph Lema, National Coal Association • Crawley Parris, National Electrical Manufacturers Association • Robert E. Barrow, National Grange • James E. Bartley and Peter Gatti, National Industrial Transportation League • Eugene Bergoffen, National Private Truck Council • T.C. Gilchrest and Judie Stone, National Safety Council • Robert Bartlett, National Stone Association • David Hawkins, Natural Resources Defense Council • Ruth McWilliams, U.S. Department of Agriculture • Fred Armstrong, Portland Cement Association • Ray B. Chambers, Regional Railroads of America • Lou Gambaccini, Southeast Pennsylvania Transit Authority • Ken Hughes, Sierra Club • Alan Voorhees, Summit Enterprises of Virginia • Thomas B. Deen, Transportation Research Board • William D. Toohey, Travel Industry Association of America • George K. Withers Jr., U.S. Army Corps of Engineers • Wayne J. Smith, United Bus Owners of America • David E. Stahl, Urban Land Institute • Charles Machemehl, Vulcan Materials Company • Ted Lutz, The Washington Post

STATEMENT OF THE HONORABLE LAWRENCE DOUGLAS WILDER

GOVERNOR OF THE COMMONWEALTH OF VIRGINIA

before the
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
SURFACE TRANSPORTATION SUBCOMMITTEE
U. S. HOUSE OF REPRESENTATIVES

March 15, 1990

THE FUTURE FEDERAL SURFACE TRANSPORTATION ACT

Good morning, Chairman Mineta, Congressman Payne, Members of the Subcommittee. I'm Doug Wilder, Governor of the Commonwealth of Virginia.

I appreciate the opportunity to testify on one of the most important issues facing Virginia and the nation as a whole....the need to re-energize our partnership on transportation. The Commonwealth appreciates your consideration of our views and concerns.

During the 1980s, Virginia's population grew by 12 percent, but highway travel in the Commonwealth increased by 50 percent, to more than 57.5 billion miles travelled.

With 116,250 lane miles of state-maintained highways, Virginia has the third largest state highway system in the nation. Not surprisingly, we are hard at work maintaining and improving our transportation systems. We estimate that this year's transportation funding in the Commonwealth will total $1.8 billion. But, still, we are falling behind.

And yet, Virginia is prepared to meet its transportation responsibilities. But we expect the federal government to play its traditional part.

In my State of the Commonwealth address on January 15, of this year, I indicated that re-enactment of the Federal Surface Transportation Act would be one of my top priorities. Consequently, I come here, today, to offer to work with you as a partner to achieve that objective.

As you consider these issues over the next several months, Mr. Chairman, I ask you to help to renew a partnership that will meet those national transportation needs. I can assure you that Virginia will do her part in this joint effort.

As a foundation for that partnership, we believe that the federal government should give to the taxpayers the transportation improvements for which their federal gasoline tax dollars have already paid.

With that objective as a beginning, I ask you to join with us in developing a forward-looking national transportation policy that will:

...deal with the growing problem of congestion and its environmental consequences within our urban and suburban areas;

...reward efforts such as those in Virginia that make imaginative use of new financing techniques;

...push the private sector, as well as state and local governments, to continue research and development in the transportation field;

...focus on moving people, not just automobiles; and

...support our efforts to use transportation policy as a means to encourage economic development and progress in our rural areas.

We estimate that at the end of the fiscal year, Virginia will have a $179 million apportionment balance in the Trust Fund. These are monies that have been paid in motor fuel taxes intended for highway improvements in the Commonwealth, but are being held hostage in the Old Executive Office Building where they are not doing anyone any good.

The sum of $179 million is the equivalent of nearly one year of our current federal program. We have projects in our urban and suburban areas just waiting for that money which Virginia taxpayers rightly deserve.

I expect, Mr. Chairman, that this very morning you and other members of this subcommittee crawled through traffic in corridors that cried out for these funds.

Mr. Chairman, my request is simple: Let our money go.

I urge that this subcommittee use its considerable influence in this body to set the Highway Trust Fund obligation ceiling at least $15 billion for the coming fiscal year.

All of the studies show that this can be done safely, while maintaining the necessary reserves and funding the urgent needs.

For my state, raising the obligation ceiling in this manner would add an additional $24 million in this year alone.

Ours is a national transportation system---not simply fifty state systems linked together. The movement of goods and people in interstate commerce....as well as the requirements of national security....place this issue on your desk as well as on mine.

Secretary Skinner acknowledges that we have to deal with the urgent issue of congestion in our urban and suburban areas. But he has yet to back up that conclusion with flexible federal dollars to address these problems.

Moreover, he must acknowledge---as Virginia has done in its most recent initiative---that it costs more to build in congested areas; the formula should be weighted accordingly.

Furthermore, Secretary Skinner needs to consider a special program focusing on those areas---one which will back up that rhetoric with funding.

Likewise, the secretary should reward states like Virginia that have addressed the issue head-on through new initiatives and creative solutions.

Yes, we are flattered that reference was made in his report to the HOV lanes on I-95 and I-395; to partnerships with the private sector such as our special tax assessment districts on Route 28 near Dulles Airport---as well as the proposed private toll facility linking Dulles with Leesburg to the west.

And yet, it would be appreciated if he mixed his shower of praise with a sprinkling of dollars as well.

Yes we are heartened by his commitment to intensified federal interest in research and technology, such as our contemplated use of "smart" highway technology between Roanoke and Blacksburg.

But breakthroughs come only after effort and a lot of shared costs.

And only the federal government has both the resources and the national perspective to lead that research effort.

Yes, we know that he agrees with our view that transportation policy requires a balanced commitment to move people: by transit, by automobile, by bicycle, and by foot.

If he and you will join us, we will finish the 103-mile Metrorail system in this area;

...we will bring commuters north by rail from Fredericksburg and Manassas;

...we will provide the transportation links in the regions of Virginia critical to national security;

...we will open up some of the rural areas of our state to the economic progress which can be provided by essential transportation links such as Route 58 across Virginia's southern border.

Mr. Chairman, we are prepared to be a partner.

We are prepared to do our share.

We have significantly increased the resources of the Commonwealth devoted to this effort since the last time this Committee considered the Surface Transportation Act.

We ask only that you join us in this commitment.

I thank you for your time, and look forward to working together during the coming months.

APPENDIX A

HOV LANES ON I-95 AND I-395

The current Six Year Improvement Program of the Commonwealth Transportation Board envisions the extension of the high occupancy vehicle lanes in the I-395/I-95 Corridor from Springfield in Fairfax County to Route 619 (Triangle) in Prince William County a distance of 19.1 miles at an estimated cost of $345 million.

The project when complete would provide for at least six conventional lanes with two separated lanes for high occupancy vehicles.

One project near Springfield is under construction at a cost of approximately $30,000,000 with a second project extending the construction to Accotink Creek anticipated in July 1990 at an estimated cost of approximately $46,000,000.

The advertisement of the balance of the work in the corridor is dependent upon the I-4R apportionments to the Commonwealth under the 1991 Reauthorization Legislation.

ROUTE 28 PRIMARY HIGHWAY TRANSPORTATION IMPROVEMENT DISTRICT

The 1987 session of the General Assembly approved legislation granting authority for special tax districts to provide localities with an alternate means of financing critical transportation improvements.

In December 1987, Fairfax and Loudoun Counties, in cooperation with local property owners, formed the Route 28 Primary Transportation Improvement District to improve the Route 28 corridor in the Dulles Airport area.

Specifically, the proposal called for expanding Route 28 in two separate phases. Under Phase I, the existing two-lane roadway will be widened to six lanes with three interchanges. Phase II will expand the roadway to an eight-lane facility with ten additional interchanges. The 1988 General Assembly authorized the sale of $160.7 million.

The two counties enacted a special levy of 20 cents per $100 valuation on all commercial and industrial property located within the Transportation District effective calendar year 1988. The financial obligation for the payment of principal and interest on the 30 year bonds is 80% by the District special tax revenues and 20% by the State's Transportation Trust Fund.

Construction began and the entire Phase I construction should be completed by mid 1991.

DULLES TOLL ROAD EXTENSION - PRIVATE INITIATIVE

The Loudoun County Board of Supervisors in May 1983 identified the Dulles Toll Road Extension as a part of its Dulles North Area Management Plan. The Extension is 14 miles in length and connects to the existing Dulles Toll Road at Route 28 to the Route 15 Bypass at Leesburg.

The preliminary engineering for the project was initiated by the Commonwealth Transportation Board in February 1987 with the location adopted by the Board in November 1988.

In March 1988, the General Assembly enacted the Virginia Highway Corporation Act permitting privately constructed and owned toll facilities. A preliminary application was filed by the Toll Road Corporation of Virginia (TRCV) with the Commonwealth Transportation Board (CTB) in March 1989 with amendments in May 1989. The CTB approved the application in July 1989.

The TRCV filed its application with the State Corporation Commission (SCC) on February 2, 1990 and it is expected that the SCC will take action within the next 90 to 120 days.

ROANOKE TO BLACKSBURG "SMART" HIGHWAY

The Six Year Improvement Program of the Commonwealth Transportation Board provides finding for the preliminary engineering for the improvement to Route 460 between Blacksburg and I-81.

The preliminary engineering studies have identified a number of alternatives with two having the support of all of the local governing bodies.

This construction of the direct connection as a federal project to use as a laboratory to test the technology associated with "Smart Highways" has been supported by the local governments in the area and, in concept, by the CTB. The proximity of the corridor to the research facilities at Virginia Polytechnic Institute & State University and the desire by the local governments to attract the manufacturers of the technology to be used in future transportation systems lend credence to such a proposal.

U. S. ROUTE 58 CORRIDOR DEVELOPMENT PROGRAM

The U. S. Route 58 Corridor Development Program contemplates the development of a modern, safe and efficient highway system generally along the U. S. Route 58 Corridor. This corridor extends approximately 508 miles from Cumberland Gap in Lee County in the west along the southern border of Virginia to the ocean front in Virginia Beach.

The final location of all of the improvements has not been determined, but several alternatives are now under study. To the maximum extent possible, the U. S. Route 58 Corridor will conform to the existing arterial highway network and will utilize existing four-lane divided highways and available rights-of-way. The most expensive alternatives being considered would cost an estimated $1.2 billion, while the least expensive would cost an estimated $638 million, both in 1988 dollars. The final location of the highway system will depend on a number of factors, including engineering and environmental considerations, cost and economic development benefits.

The Program is funded from a $40 million annual appropriation from the State Recordation Tax. In addition, the 1989 Special Session of the General Assembly authorized the issuance of $600 million in 9(d) bonds. The Transportation Board issued $200 million in debt in November 1989 and plans to issue the remaining $400 million over the next 3 to 4 years.

ROUTE 64 - CITIES OF HAMPTON AND NORFOLK
PROPOSED THIRD HAMPTON ROADS TUNNEL

Although I-64 was recently improved to a six-lane roadway between I-664 and Mallory Street in the City of Hampton, it is already experiencing congestion during peak hours. The existing traffic, which is over 72,000 vehicles per day, is expected to reach 132,000 vehicles per day by the year 2010.

The volume of heavy trucks (six-tired vehicles or larger) ranges from 10 to 12 percent of the traffic volume. This heavy volume of trucks is an indicator of the vital role played by the Hampton Roads Bridge-Tunnel in the economy of Hampton Roads. However, this heavy truck traffic effectively uses up the capacity of the right lane of each tunnel and severely limits the total capacity of the tunnels during the week days. This causes the tunnels to operate at a level of service F during weekday peak periods. Also, on weekends during the tourist season, the heavy traffic demand causes the tunnels to operate at a level of service F (stop and go conditions).

In an effort to relieve some of the traffic congestion on this section, VDOT formed the Hampton Roads Tunnels Advisory Committee to explore ways of improving communications and advising motorists of alternate routings. The strategies of this committee have had a positive effect on this severe traffic congestion. Although this section of I-64 is expected to gain some relief with the opening of I-664, traffic is still expected to grow to the level of 147,000 vehicles per day by the year 2010.

Regional Transportation plans for the Peninsula and Southeastern Virginia, as well as VDOT's Statewide Transportation Plan, show the need for 8 lanes on I-64 from I-644 in the City of Hampton to I-564 in the City of Norfolk. This proposed widening which includes the Hampton Roads Bridge-Tunnel is estimated to cost $1.13 billion to construct.

COMMUTER RAIL FROM MANASSAS AND FREDERICKSBURG
TO WASHINGTON, D. C.

The Northern Virginia Transportation Commission and the Potomac and Rappahannock Transportation Commission are continuing their efforts to have commuter rail service

in operation by the fall of 1991. The service is proposed for operation on two existing rail lines. One line will originate near Manassas, Virginia and the second will originate near Fredericksburg, Virginia. Both lines will end at Union Station in Washington, D. C. Bonds in the amount of $79.35 million have been sold and the rail cars have been ordered. Bids for locomotives are expected to be received this month. Assistance is needed from Congress to ensure that this service has access to Union Station. The Amtrak Reauthorization bill contains an amendment which limits Conrail's liability. Conrail is requiring such a limitation on liability prior to allowing the commuter rail to operate over its tracks and into Union Station.

CONSTRUCTION OF METRO RAIL IN THE WASHINGTON, D. C. METROPOLITAN AREA

The Metrorail System for the Washington, D. C. area was planned as a coordinated 103 mile rail system. Legislation enacted in 1979 (Stark-Harris) authorized $1.7 billion in federal funds for the completion of the full 103 mile rail system. Including FY 89 funds, a total of $1.507 billion has been appropriated so far. Due to increases in construction costs, the original $1.7 billion will be sufficient to build only 89.5 miles of the planned system. Legislation pending in Congress H. R. 1463 and S. 612 would authorize federal funding to construct the remaining 13.5 miles at a cost of $2.6 billion.

Funding would start in 1991 and $200 million per year would be provided to complete the system by the year 2002. These funds would support 80% of the total cost of constructing the system.

APPENDIX B

SELECTED LEGISLATIVE INITIATIVES BY THE GENERAL ASSEMBLY SINCE 1986

Enactment of Senate Bill 79 provided about $60 million per year to posture the Department for substantial increase in funding for transportation purposes. Funding was used to initiate preliminary engineering on critically needed projects on all State systems.

Enactment of Senate Bill 10 which created the Commission on Transportation in the Twenty-First Century to verify needs, develop a funding package to address the needs, and examine the relationships between the Commonwealth and local governments and agencies in transportation matters.

Enactment of a transportation revenue package approximately $422 million per year with 85% dedicated to highways, 8.4% to public transportation, 4.2% to ports, and 2.4% to airports.

Enactment of Primary Highway District legislation which permits the owners of fifty-one percent of the industrially and commercially zoned properties to petition a local jurisdiction to create such a district and to impose a maximum of twenty cent per one hundred dollar assessed tax surcharge and to dedicate such proceeds for a specific transportation improvement.

Enactment of the Virginia Highway Corporation Act of 1988 which encourages the privatization of transportation projects and improvements and establishes the mechanism for such initiatives.

Enactment of the Route 58 Corridor Development Program which dedicates $40 million in general funds from the State Recordation Tax to support a debt issuance in the amount of $600 million for the development of a four-lane divided highway across the southern boundary of the State connecting ports and recreational areas of the Tidewater area with the most western parts of the Commonwealth.

Enactment of legislation which would permit municipalities with the approval of the Commonwealth Transportation Board to dedicate up to one-third of their urban highway construction allocation to the repayment of loans by the municipalities or debt issued by the municipalities for highway projects.

Enactment of legislation calling for a constitutional amendment to permit the issuance of pledge bonds supported by revenues from the Transportation Trust Fund and established the statutory mechanism for the issuance of the pledge bonds subject to the passage of the referendum in November 1990.

Enactment of numerous pieces of legislation which permit local governments through zoning and site plan activities to cope with major developments.

Enactment of legislation which would permit the local governments in Northern Virginia and the City of Norfolk, after referendum, to impose up to 1.0% income tax for transportation and education purposes.

Increased through the State Budget, the Rail Industrial Access Program which provides funding for rail access to industries seeking to locate in the Commonwealth.

REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

TUESDAY, MARCH 20, 1990

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON SURFACE TRANSPORTATION,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, DC.

The subcommittee met, pursuant to notice, at 10:10 a.m., in room 2167, Rayburn House Office Building, Hon. Norman Y. Mineta (chairman of the subcommittee) presiding.

Mr. MINETA. The Subcommittee on Surface Transportation will come to order.

Today we will continue our series of hearings on the reauthorization of the Surface Transportation Assistant Act, and today our focus will primarily be on proposals for reauthorization of urban mass transit programs.

I will insert into the record at this point the summary sheet relative to today's hearing.

[Summary of subject matter follows:]

SUMMARY OF SUBJECT MATTER

SUBCOMMITTEE ON SURFACE TRANSPORTATION

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

URBAN MASS TRANSPORTATION ADMINISTRATION

2167 RAYBURN HOUSE OFFICE BUILDING

TUESDAY, MARCH 20, 1990

10:00 A.M.

On Tuesday, March 20, the Subcommittee will receive testimony on proposals for reauthorization of the urban mass transportation programs.

Urban Mass Transportation Program

Title III of the Surface Transportation and Uniform Relocation Assistance Act of 1987 is designated the "Federal Mass Transportation Act of 1987". This Title amends the 1964 Urban Mass Transportation Act and provides funding for mass transit programs for Fiscal Years 1987 through 1991. Federal funding for mass transit is derived from appropriations from the General Fund and authorizations from the Mass Transit Account of the Highway Trust Fund. The Mass Transit Account is funded from one cent of the revenues assessed on motor fuels.

Section 3 of the Urban Mass Transportation Act provides discretionary capital grants for transit properties. Funding for Section 3 is supported by a one cent excise tax on motor fuels. The Section 3 discretionary funds are available for grants and/or loans in accordance with the following ratios:

- 40 percent for new starts
- 40 percent for rail modernization
- 40 percent for bus needs
- 10 percent for any of the above stated purposes

The Act also establishes criteria for making grants for new or expanded fixed guideway systems, and requires the Department of Transportation to issue guidelines on how the criteria will be evaluated.

The funds are also used for urbanized area planning, innovative technology, and university transportation centers.

The Act provides for a portion of the one cent excise motor fuels revenues to be apportioned under the formula grant program known as Section 9. These trust fund amounts are only available for construction and capital maintenance purposes.

The transit formula grant program authorizes funds from the General Fund for the Section 9 and 18 programs. Section 9 funds are available for urbanized areas above 50,000 in population and Section 18 funds are available for areas under 50,000 in population. The formula grant funds may be used for capital and operating assistance subject to certain limitations for operating assistance. The Federal share provides 80 percent for capital projects and 50 percent for operating projects.

AUTHORIZATIONS

FEDERAL MASS TRANSPORTATION ACT OF 1987

(covering Fiscal Years 1987-1991)
(millions of dollars)

[1] As authorized in the Federal Public Transportation Act of 1982 (PL 97-424) prior to Gramm-Rudman-Hollings reductions
[2] Such sums as necessary

Mr. MINETA. Mr. Shuster, do you wish to be recognized?

Mr. SHUSTER. Mr. Chairman, I would just ask unanimous consent that the statement by the distinguished ranking member of this committee, Mr. Hammerschmidt, be inserted in the record at the beginning of this hearing today.

Mr. MINETA. Without objection, so ordered.

[Mr. Hammerschmidt's prepared statement follows:]

PREPARED STATEMENT OF THE HONORABLE JOHN PAUL HAMMERSCHMIDT

THANK YOU, MR. CHAIRMAN.

I WOULD LIKE TO COMMEND YOU, MR. CHAIRMAN, AND CONGRESSMAN SHUSTER FOR SCHEDULING THIS FOURTH HEARING ON REAUTHORIZATION OF OUR SURFACE TRANSPORTATION PROGRAMS. I LOOK FORWARD TO TODAY'S TESTIMONY FOCUSING ON AN IMPORTANT SECTOR OF THOSE PROGRAMS, MASS TRANSIT.

TRANSIT PLAYS AN INCREASINGLY IMPORTANT ROLE IN SOLVING THE NATION'S TRANSPORTATION PROBLEMS. PARTICULARLY IN OUR URBAN AREAS, TRAFFIC CONGESTION AND PROJECTIONS FOR INCREASED TRAFFIC GROWTH CAUSE GREAT CONCERN. IN A RECENT SURVEY OF PARTICIPANTS IN THE TRANSPORTATION 2020 EFFORTS, 80% OF THE 20,000 RESPONDENTS NOTED THAT TRAFFIC CONGESTION WAS A MAJOR PROBLEM IN THEIR COMMUNITIES.

EFFECTIVE MASS TRANSIT OPERATIONS CAN HELP TO SOLVE THIS INFRINGEMENT ON EVERYONE'S QUALITY OF LIFE AND THE ENVIRONMENT. WE MUST BE INNOVATIVE AND BOLD IN LOOKING BEYOND TRADITIONAL TRANSIT SOLUTIONS IN OUR ATTEMPTS TO ADDRESS THE PROBLEM.

I AM ANXIOUS TO HEAR IDEAS ON HOW WE MIGHT BEST STRUCTURE A NEW TRANSIT PROGRAM TO MEET OUR NATION'S BURGEONING GROWTH.

THANK YOU, MR. CHAIRMAN, AND A WARM WELCOME TO OUR CONGRESSIONAL COLLEAGUES PRESENT HERE TODAY AND OUR DISTINGUISHED PANEL OF WITNESSES.

Mr. MINETA. We have this morning starting off for us a very distinguished panel of our colleagues, all from Ohio, oddly enough. It is a distinguished panel from Ohio.

We have with us the Honorable James A Traficant, Jr.; the Honorable Paul E. Gillmor; and the Honorable Marcy Kaptur.

Let me start off with our fine colleague from the Public Works and Transportation Committee, Congressman Traficant.

TESTIMONY OF HON. JAMES A. TRAFICANT, JR., HON. MARCY KAPTUR, AND HON. PAUL E. GILLMOR, REPRESENTATIVES FROM THE STATE OF OHIO

Mr. TRAFICANT. Thank you, Chairman Mineta.

I would ask that the official testimony that I submitted to the committee be printed and accepted by the committee.

Mr. MINETA. Without objection, so ordered. Your prepared testimony will appear in the record.

Mr. TRAFICANT. Thank you.

Number one, as you know, in the last Surface Transportation Act I moved to have the minimum allocation of donor States made permanent and moved it out of the hands and protected it from Gramm-Rudman cuts.

Second, I was able to expand the safety section by getting guard rails, lights, signs, and bridge barriers made 100 percent fundable under the trust fund.

I would like to start out by saying first that I would like to see us increase the minimum allocation guaranteed return rate to donor States to 92 percent. I believe that 90 percent is not enough. The reason why I say that is almost 67 percent of all traffic is on the roads that have been cited as donor States. I think that is ridiculous. We have the traffic, we have the infrastructure needs. We have everything but the money.

I would also like to see it made free of and made permanent at that percentile level and removed from and protected from any sequestration or cuts under Gramm-Rudman or any other types of deficit control processes.

Second, I agree with the committee to move forward and try and remove the trust fund from the budget with its own board of directors and to use the trust fund that is financed by the American people through the purchase of fuel for what it is intended to do, not to offset the deficit but be put back into our infrastructure and maintain our roads and bridges which we clearly have a mandate here on this committee to do.

As far as my particular area is concerned I am just going to be brief. I was new at the time of the last bill. Jim Howard said, "You have pressing needs in your community." He said, "I will address those needs for you in future years." He passed away. I am here today with specific problems from my area whose infrastructure is falling apart.

Let me say this before I get started because everybody is pushing for their own programs—and I have standing legislation for several of these projects. They are very important to that corridor in Northeast Ohio and Western Pennsylvania, and they embrace both States in that regard.

My district is located exactly between Chicago and New York, Pittsburgh and Cleveland. At one time in the early 1960s the railroad traffic in my district had the greatest amounts of convergence by all railroads in the United States. Now, Mr. Chairman, my district's highways receive more traffic as a crossing point than any other interstate in any other interstate system of any district or State.

I want to repeat that because I am hoping that people will hear what I have to say. When Hands-Across-America was finally put together, it converged and had gone right through the 17th district of Ohio because it is right in the middle of the country with the interstate system never completed and falling apart.

There are three bills pending before this committee. The first one would connect the interstate system of the city of Youngstown, which has been decimated by the loss of the steel industry, with nearby Pennsylvania, opening up opportunity for Northeast Ohio and Western Pennsylvania travellers by opening that system up and connecting it to Route 80 in the State of Pennsylvania.

There is a bill in to that extent. It is called the Hubbard Expressway, and it seeks $27 million in discretionary funds.

Let me say one other thing. I also feel that minimum allocation donor States should not be penalized by specific appropriations for needy projects and it should not be computed in those factors.

The second project on the list is that all of that old steel mill property sits there abandoned without being used, and right in the middle of it is one of the most important bridges that we have in the general Youngstown, Campbell, Lowelville, and Strothers community near Pennsylvania. It would call for access ramps from the existing freeway system and a new bridge to be built across the Mahoney River that touches all four of those communities and nearby Pennsylvania.

That project is also a standing piece of legislation known as the 680 Access Ramp Project at $15 million. Included in that is the Center Street Bridge Project that would accompany those access ramps and provide that opportunity to both Ohio and those local communities in Pennsylvania.

Third is the connector from the airport system to the interstate out there where that particular Northeast Ohio and Western Pennsylvania community is being denied that access and utilization of that airport is under tremendous strain. That project is known as the Kings Graves Road Project, and it is listed by standing piece of legislation.

Finally, there is a bridge project on the interstate system known as crossing the drinking water reservoir in the part of the country known as Meandor Reservoir with a bridge project of approximately $12 million.

Now, you are saying I just didn't come in here today to talk about the State's needs, because, to be quite honest, the State has never really addressed our needs there. The infrastructure is falling apart. I have waited. I have listened to the chairman. Those three pieces of legislation are prudent not only to Northeast Ohio but to Western Pennsylvania. As a member of the committee and as a member of this subcommittee I want affirmative action in this particular regard.

Finally, I don't believe that 92 percent minimum allocation is enough. These 19 States that are being penalized are the 19 States that bear the brunt of the traffic in America. Their infrastructure is falling apart and we are continuing to penalize them on a formula system that can't be good for America because it is not good for the 19 biggest States that have the most travel.

So I am asking that that be addressed, the 92 percent minimum allocation be considered, that it be protected from any sequestration and/or cuts due to deficit reduction, and that any discretionary use of funds not be applied towards or taken from the computed allocations under that minimum allocation standard.

I would appreciate in advance your support for those projects whereby I did not have one demonstration or discretionary project in the last Surface Transportation Bill—I think the only member here. I was new. The only Democrat unseated Republican. The chairman asked me—he was worried about a veto to keep it out. I gave the chairman my word and I did. He passed away. My community got screwed, and I don't want to hear any more of it now. I want help. My community has been hurt the most. I played the game with the chairman, the President's veto, and I want the help now.

I am open for any questions.

Mr. MINETA. Very well. Thank you very much, Mr. Traficant.

As I take it, you have identified really four projects: the Center Street Bridge, the bridge crossing on the Meandor Reservoir, the Hubbard Expressway, and the Interstate 680 access ramp development.

Mr. TRAFICANT. And one more, Mr. Chairman: the Kings Graves Road connector from the airport to the interstate system to serve Northeast Ohio and Western Pennsylvania utilizing that airport—the municipal airport system.

Mr. MINETA. Let me concentrate on these last two—the Hubbard Expressway and the Interstate 680 access ramp development project. These are two meritorious projects and would really form the basis for a solid transportation infrastructure and network for redevelopment in that Youngstown/Warrenton area.

But I am wondering if you could explain to me why the State of Ohio, if it is that important, has not seized the initiative for the construction of these two projects in an effort to stimulate economic development in that area?

Mr. TRAFICANT. Mr. Chairman, one of the reasons is the lack of local leadership in this area. When I was elected to Congress I asked the Ohio Department of Transportation to visit with me down here and I asked them why these important projects were not on the priority list. They said the local politicians wanted to move a meat packing firm from the Market Street Bridge somewhere and they couldn't get the local politicians to agree on anything.

I brought the local politicians together and we got these items placed on a priority list. As a result, I am not asking for money for the 711 connection in the city of Youngstown; the State has announced that it would take care of 711. But because of that political malaise over a period of time, priorities were placed more on local political favoritism and agendas and not on the overall good.

I am here today saying that any priority list for the State of Ohio that does not include those projects is asinine for the following reason—if I could have the attention of the chairman.

The freeway system in Northeast Ohio is not completed. The system on the east side of Youngstown stops dead at Albert Street, and on the west side of Youngstown stops dead at the old steel mills and doesn't even connect with Interstate Route 11. These are the things that I am trying to now bring about.

Second, the Center Street Bridge project is very, very tentative at this point. It is a dangerous bridge and with age it is continuing to wear. I think it is prudent that Congress do something about it.

Finally, the State of Ohio only has so much money. To be quite honest, they have been putting it in places where they probably shouldn't be—on a political system that is probably out of date and more patronage than it is factual. I am not blaming the governor or anybody. But for anybody to deny these projects on the strength that the State may not have blessed it would be, in fact, a miscalculation of America's needs.

I am saying this today: my district, right in the middle of the country, that has more freeway traffic than any other Member's, that connects one area with another and one commercial area with another, we have let that area go without adequate funding, without adequate planning. So rather than complain and blame the State or the local, now is the time I think to put that together in conjunction with the State. The State is taking care of the 711 connector.

I have taken upon myself for the Hubbard Expressway, the Center Street Bridge, and that airport connector, and I am hoping that the committee, in lieu of the fact that I adhered to the counsel and respect the counsel of the former chairman, Jim Howard, would find favor with these recommendations I make today.

Mr. MINETA. Thank you very much.

Mr. Clinger, any questions?

Mr. CLINGER. No, sir.

Mr. MINETA. Mr. Clement?

Mr. CLEMENT. No questions.

Mr. MINETA. Mr. Hastert?

Mr. HASTERT. No, sir.

Mr. MINETA. Mr. Emerson?

Mr. EMERSON. No questions, Mr. Chairman. I would tell Mr. Traficant that I look forward to working with him on this. I have an understanding of these kinds of problems and look forward to cooperating with you.

Mr. TRAFICANT. I appreciate that, Mr. Emerson.

Mr. MINETA. Let me then call on our colleague from Ohio, Congresswoman Marcy Kaptur.

Ms. KAPTUR. I thank you, Chairman Mineta and members of the Surface Transportation Subcommittee, for this opportunity to testify.

I would like to ask unanimous consent to place my full statement in the record and I will try to summarize.

Mr. MINETA. Without objection, so ordered. Your written statement will appear in the record.

Ms. KAPTUR. I want to begin by saying that the major concern that I hear from local officials who are in charge of transportation, engineering, and planning in my area is that the current Federal laws converge in a way that make projects that receive Federal funds in my area end up costing too much, largely due to excessive Federal rules and regulations which end up causing lengthy project delays and costs plus lengthy construction phases.

If I have a major recommendation to you beyond the specific projects I will talk about, it is to try in some way in the next Transportation Act to make delivery of Federal highway dollars more efficient and more effective.

I want to give you two examples of what is happening in my own community in relationship to their dealings with the Federal Government, the first dealing with an ongoing project, which is detailed in the testimony called the Buckeye Basin Greenbelt Parkway. This project is now estimated to cost $45 million, of which almost 85 percent of those dollars will be Federal. When it was begun 15 years ago it was projected in those days to cost $25 million. The testimony details why this type of lengthy delay has occurred.

In addition to that, the testimony also has other examples of where cooperation with the Federal Government has meant cost overruns at every phase. Frankly, my community is at the point of being totally fed up, and I would beg the interest of the committee in trying to somehow speed the distribution of those Federal resources to States and localities.

I wanted to concentrate this morning on a new proposal that our community is putting forward for a new river crossing across the major tributary which divides our community called the Maumee River. Our long-range transportation plan has included several new crossings of the Maumee River in it.

Currently there are seven existing bridges which carry traffic in the area, and over the next 20 years all will be heavily congested. Many are already heavily congested.

All but one of these current bridges is a State or Federal route, and three of the current bridges are on the interstate system.

Now, the Maumee River crossing has been placed on the discretionary bridge candidate list by the Ohio delegation, and I am very grateful for that. But I wanted to give you a specific example of where we run into difficulty.

The Craig Memorial Bridge, which is one of these several bridges, is part of the I-280 system and was built during the 1950s before the interstate system was conceived.

In 1985, this particular artery carried about 51,000 vehicles per day—and it is a four-lane bridge—which is above a safe capacity. Now, projections are that the bridge traffic will double in the next 20 years.

What is unique about this particular artery and the bridge is that it is a major interstate link tying our part of Ohio to Michigan, and also to points east and west along I-80 and I-90 which run from coast to coast, because those are turnpike routes.

The current bridge not only serves interstate needs, but it also serves many local needs. In fact, it is unique in that it is a lift bridge on an interstate route. It is one of only two lift bridges in

the entire interstate system. It is a bottleneck of major proportion at rush hour or during the day when you have got truck traffic going over the bridge and car traffic, and, at the same time, the bridge is opening for ships to come in to go down to our grain elevators. With the rebirth of Lake Erie and pleasure craft and boating on the lake, as well, you have a number of bridge openings that occur and cause constant traffic snarls in the area.

By the turn of the century this particular bridge will be over 50 years old. It is the most important projected—this improvement project is the most important projected highway improvement project in our metropolitan area since the interstate system was designed in the 1960s and 1970s. But our local community has made a decision—which I think is unfortunate—to start this project using only State and local funds, even though this project eminently qualifies for Federal assistance.

The local community is investigating all types of non-Federal funding because they truly have had it in dealing with the Federal Government because of the endless regulation and strings that are attached to Federal money.

For me as a Federal representative, it ultimately means that our area would not avail itself of Federal funds to build the biggest and most important highway project in 30 years. I think it is absolutely wrong what they are doing because our citizens pay Federal taxes, as well. But looking at the history of involvement with Federal highway projects in the area, I can understand their concerns about how much it would end up costing if we deal with the current maze of Federal highway approvals and regulations and so forth.

So I guess my major plea to you is to please help us find a way to streamline the manner in which local communities and State governments deal with the Federal Highway Administration.

In terms of the distribution of Federal highway funds to States on the formula that I know you are all concerned about, as am I, I join with my Ohio colleagues, Mr. Gillmor and Mr. Traficant, and all of the others in requesting that changes be made in the formulas used to distribute both highway and Federal bridge funds.

I would suggest that since the original distribution formulas were developed back in the early 1900s, many of these formulas now bear no relationship to where people live and how they use our highway and bridge systems.

I would ask the committee to consider two possible alternatives. One would be to change the factors that you currently use to distribute 4R funds to the interstate system. Ohio is one of the most populous States in the country, and yet urban population is not a significant factor in any of the current formulas that are drawn. In fact, if one looks at the 4R formulas to date they would look at such items as lane miles of roadway, measurement of the extent or size of the network, vehicle miles of travel.

Bridge funds are similarly distributed.

I would ask the committee to consider proper distribution of highway and transit funds to reflect that our urban population is now the majority of our population in the country and that it is urban areas where many of our current transportation problems exist.

One of the other areas I would like to point out is that if you cannot do that, if you can't change the factors constituting the formula, perhaps we could gain support for a fall-back position whereby States like Ohio could gain an appropriate share of funds by creating a higher ceiling of the dollars sent back from Washington to our local communities. I think that the minimum of 85 percent needs to be raised to a minimum of at least 90 percent, and I think others might even support a higher figure.

I would also like to mention two other related items that are important in our community.

First, we have so many conflicts between inter-modal transportation. I represent one of the largest rail-switching areas in the United States. We also have the Great Lakes Saint Lawrence Seaway system with all the bridges that I have referenced, plus the highway traffic. We have had enormous difficulty in even getting planning funds from the Federal Government in order to help us try to deal with the conflicts that exist between these various modes of traffic.

As I mentioned, we have one of the few lift bridges where we have a conflict between sea traffic and highway traffic, also rail traffic. It is very difficult for us to get attention to these problems. For several years now I have tried to get planning funds to take a look at redesigning our rail system and to try to get rid of the many, many dangerous rail crossings that come across our highway systems in the greater Toledo area. We have not had too good a reception to deal with these great separation issues and the inter-modal conflicts that we do have.

But I would ask the committee to take a look at communities like my own and perhaps include some encouraging language where we could at least get some planning assistance where you do have this inter-modal conflict.

Finally, in terms of transit, if I could just end by putting in a plug for our local TARTA—our local transit system. Over the past several years real funds, as you know, have been cut by half. Without the operating funds of the Federal Government our local bus system, which includes pair transit for disabled individuals, would have to be shut down. If we look at the funding that existed back in the early 1980s, which was about $3.1 billion in those days for mass transit, if it could only have been kept at inflation the current funding level in the budget should be more like $6.5 billion. I would ask the committee to not only help communities like my own, but others around the country where so many thousands of citizens depend on transit in order to get to work and conduct their daily lives.

I would also finally ask you to take a look at the operating cap that has been placed on small urban systems. By removing that operating cap you would allow local communities that flexibility of using Federal funds that are available where the local community believes they should be used.

I thank the chairman and members of the committee for your attention to my testimony and those of the other members of the Ohio delegation. Thank you.

Mr. MINETA. Thank you very much, Congresswoman Kaptur.

Let me ask about that I-280 bridge, the Craig Memorial Bridge. The State of Ohio receives approximately $49 million currently under the bridge rehabilitation and replacement program. So this Craig Memorial Bridge is eligible for funding under the formula program and the discretionary bridge program. As you are probably very well aware, any distribution of funds that come under the discretionary pot received by a minimum allocation donor State will also result in the reduction of minimum allocation funds.

I am wondering: are you aware as to whether or not the State of Ohio has allocated any of its Federal aid, highway bridge funds, or minimum allocation funds for the replacement of this I-280 bridge?

Ms. KAPTUR. Mr. Chairman, that is a very good question. All I know at this point is that we have been placed on the discretionary bridge candidate list by our own delegation. But I do not have certification from the State that we are in line for those funds.

Mr. MINETA. Let me at this point—Mr. Shuster, do you have any questions?

Mr. SHUSTER. I don't have any questions. Thank you.

Mr. MINETA. Mr. Clement?

Mr. CLEMENT. No questions.

Mr. MINETA. Mr. Clinger?

Mr. CLINGER. I have no questions, Mr. Chairman.

Mr. MINETA. Mr. Hastert?

Mr. HASTERT. No questions.

Mr. MINETA. Mr. Packard?

Mr. PACKARD. No questions, sir.

Mr. MINETA. Mr. Emerson?

Mr. EMERSON. Mr. Chairman, I think Ms. Kaptur has made a very interesting statement. One of the complaints that she made—I suppose it is a complaint—the concerns of local officials about the labyrinth of Federal regulations and laws. I would hope that we would take the opportunity at this unique juncture as we review Federal highway and transportation policy to simplify. I really hope that we can do that as we consider the important legislation that lies ahead of us here in the next couple of years.

I think you make a very good point that we need to take note of the changed demographics in the country and respond to problems that have arisen because people have moved around in the course of the past number of years under which we have been operating under current law and building highways and bridges and trying to improve our infrastructure. So I think we need to take a very sensitive look.

Finally, I would urge you—let's not get into an urban/rural conflict. Let's see if we can try to work together. Please don't assume that rural areas don't have their fair share of the problems that you mentioned urban areas as having. I am aware certainly of the kinds of problems you face uniquely in some urban areas, and we have some unique problems in rural areas, as well.

Thank you for your very fine statement.

Ms. KAPTUR. I thank the gentleman for your attention. I noted you were listening very carefully as I spoke and I appreciate that—all the members on the committee. I would just ask—perhaps there is a way you could develop some very creative language on a statute of limitations or something to deal with this time problem

where the minute you start dealing with the Federal Government on these highway projects the costs just go off the wall and local communities are very fearful—at least mine is at this point—of dealing with the Federal Government any more. Though they want to get on the State list, their experience has been very negative over the last 15 years.

Mr. MINETA. At this time let me call on our fine colleague, Mr. Gillmor, a first-term member who took the place of a very fine and respected member, Congressman Del Latta.

Paul, go ahead. Your statement will be made a part of the record, so go ahead and proceed on your own.

Mr. GILLMOR. Thank you, Mr. Chairman.

Mr. Chairman and members of the Surface Transportation Subcommittee, I appreciate the time and the opportunity to appear before you this morning.

I join with my Ohio colleagues in requesting changes in the formulas which are used to distribute highway and bridge funds. Having served as president of the Ohio Senate for six years and having dealt with funding formulas, I understand that funding formula changes are extraordinarily difficult to enact—especially without new revenue. But I am convinced that the cost of continuing the current policy is so high that corrective action must be taken.

Revising formulas in this reauthorization bill may be a lot easier and a lot cheaper than the alternative, which is delay.

The U.S. Department of Transportation statistics indicate that serious deficiencies in our highway system are increasingly concentrated in donor States. Department of Commerce data confirms that the 19 donor States generate more than half of the industrial and agricultural production of this country and more than half of the service business in the United States.

This indicates that the majority of U.S. workers, as well as the majority of U.S. goods shipped by truck to foreign and domestic markets, must travel on increasingly inadequate highways and bridges. In short, we are not putting our Federal transportation dollars where they are needed most, nor are we investing our Federal transportation dollars where they will give us, as a nation, the greatest economic benefit.

If current funding distribution practices are allowed to continue, our surface transport problems will not only worsen, but they will do so at a faster rate.

The cost of postponed highway and bridge repairs accelerates exponentially. At the same time, unless we change the way Federal transportation funds are distributed, the States with the worst problems will continue to have the least money to solve the problems.

As you will see, this is the case for donor States which have substantially increased their State and local user fees. Ohio has raised its gas tax six times in the last ten years—from $0.07 a gallon to $0.18 a gallon in 1989. An additional increase of $0.02 a gallon goes into effect July 1 of this year.

The impact of these increases has been a tripling of the State gas tax while there has been a doubling of the Federal gas tax. But even with those huge increases, donor States like Ohio cannot

make up their shortfall in Federal funding fast enough to keep up with the problem, nor should they have to.

Why should Ohioans pay $0.20 a gallon in State gas tax in addition to the $0.09 Federal tax and still bear the burden of a disproportionate share of America's hazardous roads and bridges?

Current law directs discretionary funding to States which already receive the most back on their Federal gas taxes and highway user fees. The States that get the largest proportion of Federal aid by formula also get exclusive access to discretionary assistance.

Now, having seen in recent years these significant increases in the Ohio State gas tax, I am particularly distressed that States which enjoy this exclusive access to discretionary Federal highway and bridge aid often have far lower taxes than the State of Ohio. This means that donor State user fees become transfer payments to other States which use this transferred income in lieu of raising their own State and local taxes.

Clearly discretionary funds should go where there is the greatest need. Eliminating the requirement that donor States pay pack an equivalent amount of minimum allocation dollars for every dollar of discretionary funds will help ensure that this need is met. However, that action, alone, is not enough to correct the pervasive pattern of disinvestment in donor States.

Donor States account for more than 60 percent of interstate miles travelled annually in this country. Donor States account for more than 57 percent of the travel on the primary system and more than 59 percent of travel on the urban system and more than 62 percent of travel on the secondary system.

Now, I do not presume to suggest to the committee what factors to consider when examining the formulas, but any rational change which disburses funds in ways that are more closely related to the extent of use of Federal highways would certainly help to alleviate the problem. And if the formulas cannot be changed, I certainly agree with my colleagues, Ms. Kaptur and Mr. Traficant, that the minimum allocation should be increased from 85 percent to a minimum of 90 percent. That is not sufficient to correct the trend toward concentration of deficiencies in donor States, but it would at least help to slow down the rate of deterioration.

I thank you very much for your time and consideration, and I look forward to working with members of this subcommittee as the bill works through the House, and certainly any changes in the distribution formula as we have discussed would have my support.

Thank you very much, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Gillmor.

Ms. Kaptur, I appreciate your coming back because there are a couple of general questions I wanted to direct to both of you.

Congressman Gillmor is also indicating support for the inclusion of the I-280 bridge as part of the program.

Mr. GILLMOR. Yes.

Mr. MINETA. Now, we have received testimony that the current Federal highway investment policy is having a cumulative detrimental effect on the highway system in Ohio. Therefore, the suggestion has been made that Federal highway funds should be allocated, of course, in a fair and equitable manner.

I am wondering what, in your view, is a fair share for donor States to receive under the Federal aid highway program?

Mr. GILLMOR. I think clearly it is a figure substantially higher than the current allocation. Ohio is a State which, as I indicated, is a donor State. It has the greatest need in terms of the use that is being made.

In addition, the way Federal formulas have changed over the years, some of the donor States now are some of the poorer States. The most recent national figures, for example, show that Ohio has a per capita income below the national average. So you have a State with that circumstance and you have a State that also has a greater need. You have a State that has raised its taxes for highways more than other States to the point where ours are now higher and we are, in essence, subsidizing those States.

I don't presume to tell you what specific formulas, but when you look at the end result I think it is clear that you have an injustice in the way the funds are being transferred. It is a case of the poor States taking care of the rich States.

Mr. MINETA. Ms. Kaptur, do you have any comments?

Ms. KAPTUR. I would agree with the gentleman about Ohio's willingness to tax itself, and I think that a States willingness to bear its own burden should play a larger role in the formula if you are going to change the factors in the formula. It seems to me you have two sets of choices: one choice is you can try to tinker with the factors that comprise the formula, or, if you feel you can't do that, then I think you have to raise the floor, as we have both suggested, to a minimum of 90 percent.

As a member of the committee, if I were a member of the committee I would like to tinker around with the factors that comprise the formula. That might be fun. But I don't know enough about all of the issues that you have to deal with with your membership to know if that is possible. But I do think that States that are willing to assume a larger share of their own tax burden, as Ohio has, is an extremely important item.

I mentioned urban population in my remarks. Ohio has more urban areas than any other area in the country, actually, if you look at the way the State is glued together. We do, therefore, have a great need for major transportation facilities. We also have a very large agricultural community. Food processing is Ohio's biggest business, so we have to move product from our rural areas into our urban areas into processing plants, etc., so we have a great need in the rural communities, as well.

But I think that if you look at the number of urbanized areas that exist in certain communities where you are moving product, etc., the number of trips that have to be taken, that is an issue. I think the income suggestion that Mr. Gillmor made is also a very good one.

But I have always been a believer in tax burden. If the State is willing to take that on, they ought to be given some credit for it.

Mr. MINETA. You are indicating, as well as the others, increasing the 85 percent to 90 percent. If we were to increase that percentage, should the discretionary funds that States do receive be considered in determining the minimum allocated in terms of entitlements?

Mr. GILLMOR. I think that States should not have a deduction from the minimum allocation when they do receive discretionary funds. The ideal thing would be to come up with a distribution formula that results in a more equitable result. That is extremely difficult to do.

I think very clearly, in terms of equity, if Congress determines that there is a project that qualifies for discretionary funds, we are really directing what the States do with their share. Therefore, I think we should not offset the minimum allocation by the amount of discretionary funds, and we should at least raise the level of minimum allocation.

Ms. KAPTUR. I would agree with that.

Mr. MINETA. Very well. Thank you.

Mr. Shuster?

Mr. SHUSTER. I thank you, Mr. Chairman.

I would point out to my colleagues that, as, in fact, has been indicated, I think it would be extremely difficult to change formulas unless we, along the way, find additional funds. One of the easiest ways, one of the first ways to find additional funding for our transportation programs, is to spend the money that already exists in the Highway, Transit, and Aviation Trust Fund where very large surpluses have built up.

We have had three votes over the past two years on taking those trust funds off budget. I would expect we are going to have further votes on that issue. I would urge you and anybody who is concerned about finding more funding for transportation to seriously consider supporting those votes when they occur because we are not going to get more funds until we solve this problem first.

Thank you.

Mr. MINETA. Mr. Clinger.

Mr. CLINGER. No questions.

Mr. MINETA. Mr. Hastert?

Mr. HASTERT. I would like to simply follow up what Mr. Shuster said.

First of all, I want to thank the two people up here for their testimony. It really went in depth and I think you made a good case for donor States. Being from a donor State, I understand what you are talking about.

But the real issue is what Mr. Shuster said. There are billions and billions and billions of dollars stacked up there ostensibly for roads and bridges and some mass transit that we have used to shade the deficit. Of course, sometimes you are speaking from the viewpoint of a committee, which when you sit on this committee you understand that those funds probably ought to be spent out for what they were taxed for. Every time somebody goes to the gas pump in your State, Mr. Gillmor, and puts a gallon of gas in the tank you are putting $0.18 in the coffers of Ohio and $0.09 in the coffers of the Federal Government that don't get spent out. That is a real issue.

I think if there is support there to start to spend those dollars there is more for everybody. Certainly then you can start to massage the formulas, as well.

Any comment?

88-253 O—91——33

Mr. GILLMOR. Yes. Mr. Chairman, I would agree with what both Mr. Hastert and Mr. Shuster have said. The funds were collected, in my view, for a specific purpose. Very clearly the need is there. I don't think we are serving the economic wellbeing of the country by not utilizing those funds. I concur very definitely with your comments.

Mr. HASTERT. Thank you, Mr. Chairman. And thank you Mr. Gillmor and Ms. Kaptur.

Mr. MINETA. Mr. Emerson.

Mr. EMERSON. Mr. Chairman, I want to strongly associate myself with the remarks of the gentleman from Pennsylvania and the gentleman from Ohio. I think they have hit the nail on the head.

Mr. MINETA. All right.

Mr. Packard.

Mr. PACKARD. No questions.

Mr. MINETA. Mr. Boehlert.

Mr. BOEHLERT. No questions.

Mr. MINETA. Mr. Laughlin, it is nice to have you at the subcommittee.

Mr. LAUGHLIN. Thank you, Mr. Chairman.

Mr. MINETA. I assume you have no questions.

Mr. LAUGHLIN. I have no questions at this later hour.

Mr. MINETA. Very well.

Let me thank Congresswoman Kaptur and Congressman Gillmor for their presentation.

[Mr. Traficant's prepared statement follows:]

SUBCOMMITTEE ON SURFACE TRANSPORTATION

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

2167 RAYBURN HOUSE OFFICE BUILDING

TUESDAY MARCH 20, 1990

10:00 A.M.

By,

Congressman James A. Traficant, Jr. (17th District - OH)
312 Cannon House Office Building
United States House of Representatives

SURFACE TRANSPORTATION ACT - CONGRESSIONAL TESTIMONY:
MINIMUM ALLOCATION FUNDING VS. DISVRESTIONARY FUNDING

Mr. Chairman, I'd like to thank you for the opportunity to testify today on the subject of issues pertaining to the next Surface Highway Act. My topics today include one which affects many of our major states and one that addresses the funding of local highway projects in my district.

In 1982, as part of the development of the Surface Transportation Assistance Act (STAA), Congress and the Administration recognized that Federal-aid highway apportionments to certain states chronically lagged behind the Highway Trust contributions from these states. In a number of cases, the sum of the formula apportionments to select states amounted to only 65 to 80 percent of their percent of Trust Fund contributions.

Congress determined that these long-standing disparities should be addressed by guaranteeing each state, at least, an apportionment equal to 85% of the total percentage that each state contributed to the Trust Fund. This, then, became what is known as the "Minimum Allocation". It was not completely equitable, but it was better than the previous condition. Recall that the federal-aid highway program and formulas were, to a large extent, driven by completion of the Interstate Highway System. Realize, that now, we are beyond that phase.

In 1987, during the debate concerning the Surface Transportation and Uniform Relocation Assistance Act (STURAA), a significant change was added to the language. For the first time, the Minimum Allocation funding was to be decreased for any state's apportionment if that state received any discretionary funding. This created a situation where Minimum-Allocation states would lose, dollar-for-dollar, any benefit from discretionary funding for large bridge or Interstate highway completion projects. However, states that were apportioned, say, 140% of their contribution level to the Highway Trust Fund could secure discretionary funding with no loss or penalty. Thus, only states receiving more than an 85% return from the Trust Fund, based on their contributions, could benefit from discretionary funding. This is clearly illogical. It essentially creates a situation where those with less get less and those getting more will get more. This is backward. For example, if Ohio accepts discretionary funds then it must give up that same amount of Minimum Allocation. It turns into a zero sum game.

It has been brought to my attention that several Minimun-Allocation states chose not to fight against this new provision, because they did not wish to jeopardize the continuation of the Minimum Allocation funding they were already receiving. They believed that the loss of this program was a real possibility if they struggled against the new language. As indicated below, Minimum Allocation accounts for a great deal of relative funding.

Mr. Chairman, in Fiscal Year 1990, Minimum Allocation funding constituted 10% of the total Federal-aid highway apportionments. Nineteen states are now receiving minimum allocation funding. For states like Ohio, this source represents a full 24% of the federal-aid apportionment. In Fiscal Year 1990, Minimum Allocation funding accounted for 32% of Texas funding, 29% of Georgia's, Wisconsin's and Indiana's apportionment; 27% of Oklahoma's; 25% of South Carolina's; and 24% of Arizona's and Arkansas's.

Let's examine for a monent the relationship between Minimum Allocation funding and the critical issue of our "Deficient" bridges. These 19 states contain 55% of the nation's deficient bridges. But, they cannot benefit from discretionary funding to fix them because of the 1987 language. In my district I have two such bridges: 2

1>
Name: Center Street Bridge
Crosses: Industrial Land
Location: Youngstown, OH
System: FAUS
Work: Replacement with new structure just east of current bridge
Status: Preliminary Engineering: construction expected by 1996
Cost Est: $ 18.1 million (total) $ 11 million (bridge portion)
Proj. ID. (Mah-CH-313 - 0.43)

2>
Name: unamed
Crosses: Meander Reservior
Location: I.R.-80, 0.97 miles east of Ohio Turnpike (IR-76)
System: Interstate
Work : Replacement of two 120' bridges with a partial causeway and shorter structures.
Status: Preliminary Engineering: construction programmed for 1994.
Cost Est: $ 11.1 million
Proj. ID. (Mah-IR-80- 0.97)

These 19 states represent 60% of all highway travel, as measured in 1987. And, they contain 65% of all "Deficient Interstate Highway Mileage", as measured by the pavement conditions rating in 1987.

As we consider the next Surface Transportation Act, we must seriously attempt to eliminate the chronic inequities in distributions from the Highway Trust Fund via the present formula. In this regard we must:

1) Over the life of the next Act, phase-in an increased quaranteed return from the present 85% starting in Fiscal Year 1992 to 92% in 1995;

2) Retain the current method of calculating the amount of the Minimum Allocation funds to be distributed, (thereby excluding discretionary and emergency funding) but do not reduce any state's Minimum Allocation funding when such states receive either discretionary or emergency federal-aid highway apportionment, allocations, or appropriations.

3) Retain current provisions that make Minimum Allocation funds available to be converted into any other categorical funding.

I sincerely hope that these relativley modest changes be enacted in the Surface Transportation Act. As we move beyond the era of Interstate Highway construction, we must also take a fresh look at the issues of equity, need, and contibution.

These are serious issues, especially for the states that have been willing to put their interests aside in order to assist in the financing of the Interstate System completion over the past 10 years. Without a return to a considerably more equitable outlook in the new Act, I fear that support for a truly national transportation direction and role will not materialize. Our country's economic well-being and competitiveness depends upon our successful resolution of these matters.

I am concerned about our trade deficit, and budget deficit. I am concerned about America's ability to compete. Our highway infrastructure is without question, one of the most important components necessary for international competition. America's manufacturers rely on our roads to function. For example, there are 104,000 workers in Ohio alone employed at automobile manufacturing plants. Auto factories are seriously reliant on interstate and state-wide highways. Issues of productivity as related to time sensitive delivery are all a function of the quality of our roadways. 3

As the "Buy American" Congressman I would like to make this appeal for fair and equitable funding for the 19 states so closely tied to what manufacturing base America still has left and once again must cultivate. It is critical that these important states have an infrastructure that can meet the performance demands of the 21rst century. If we are to have products available to buy from American producers we must provide these producers with an infrastructure that meets their demands.

DEMONSTRATION PROJECTS

Mr. Chairman, I want to thank you and the Members of the Sub-Committee for granting me the opportunity to testify on behalf of the Hubbard Expressway Project and the Interstate 680 access ramp development project:

Over the last 10 years or so my district has lost well over 55,000 jobs. My district, as you know, is one of the most economically depressed areas in the United States. This however was not always the case. For many years the Youngstown-Warren metropolitan area maintained its stature as the 3rd largest steel producer in the world. In fact, at the tail end of World War II, Youngstown surpassed every steel producing source ever in existance before 1945.

As demonstrated in the past, the 17th district has historically been able to make great contributions to our nation. It was not simply the steel manufacturers that located in Youngstown that made it one of the number one industrial cities but the tenacity and the drive of the working population that made it a success. This tenacity still exists today except that it is very few places to be channeled. This is because the area is still trying to recover from the steel industry shut down. It is also because economic re-development is slow in evolving. This is because we are still lacking some of the ingredients that attract economic development. We have the population resource to attract the developers but we are lacking some of the infrastructural benefits that other areas can offer. I believe that these two projects listed above would serve to inspire such needed economic development.

PART I

The **HUBBARD EXPRESSWAY** project would connect interstate 680 which loops around Youngstown directly to interstate 80. This critical project would create a direct access into and out of Youngstown from the nation's # 1 traveled interstate, (I-80). It is intuitively clear that this 5.5 mile link would be a great spur for economic development in the region. This is especially critical because such a project would be the project that fully utilizes one of the strongest selling points the 17th district has to offer and that is simply its geography. Youngstown is situated directly between Chicago and New York City on I-80. In addition to this it is also situated between Cleveland & Pittsburgh. Cleveland is one of the nation's leading great lakes shipping ports and Pittsburgh is the nation's largest inland shipping port.

Planning for the Hubbard Expressway has been under consideration by the Ohio Department of Transportation and the City of Youngstown for many years. The original alignment within Mahoning County was proposed as part of a three-leg radial arterial highway system for the City of Youngstown in 1952. In 1957, a public information hearing held by the City of Youngstwon solicited public comments on the proposed arterial highway system. In 1959 an engineering report published, The City of Youngstown, Ohio, Arterial Highway System, included a proposed alignment of a "Hubbard Expressway/ Himrod-Albert Connector." (At that time the connector was a portion of the proposed Innerbelt; it is now the last leg remaining to be completed). In the early 1980's the Himrod Avenue to Albert Street connection was completed. Essentially, all that remains is the leg from interstate 680 to I-80.

Without question the **HUBBARD EXPRESSWAY PROJECT** would enhance the geographical strengths the city inherently possesses. It is a project that builds on an (already existing strength). When you build on strengths it almost always brings success. Success in economic development is what my area needs so desperately. The amount needed to be authorized for this great project is $ 27 million.

PART II

The second project in which I am seeking authorization is the **INTERSTATE 680 ACCESS RAMP DEVELOPMENT PROJECT**. This is another project that would function as an economic development catalyst.

This project was conceived to re-develop an area which was once the flat clearings in which the original steel plants once operated. This land in a sense has already been prepared for development by virtue of its original leveling for the steel mill sites. It has been suggested by development experts in Ohio and Western Pennsylvania that these areas are prime for re-development because so much of the land clearing and surfacing has already been completed.

The proposed project is to simply provide access ramps to the areas where the steel mills once operated from interstate 680. The conception suggests that given the combination of the access ramps and the connection they provide to the interstate along with the inherent desireability of the cleared flat lands adjacent to the city, economic development would be sure to follow. In short, incentives for development would be strong.

The strongest factor in favor of this project is the aspect of precedence. As it turns out, a successful precedent has already been set in Pennsylvania. In Fayette County located in western Pennsylvania, the Chadville Project followed through on the same rationale as I have described above in regard to access ramp construction. The Chadville Project entailed the successful construction of ramps to a local major roadway and consequently (keeping with theory) inspired development in the area that was once an industrialized steel manufacturing center.

This idea can work. It has been proven in an area much like my own and less than 100 miles away. The authorization amount I am requesting for this dynamic project is $ 15 million for study, design, & construction. I believe that this project would turn out to be the most successful of its kind because of the 17th district's prime geographical location and the proximity of the development area itself to the city and its major highways.

When evaluating my proposals please consider the economic state of my district but also consider the strengths that the Youngstown/Warren area have to offer in terms of its potential for achieving real economic development by indeed having the capacity to attract more business and industry settlement.

1) A population resource available and willing to work.

2) An exraordinary geographical position linked closely to the majority of America's population.

I want to thank-you Mr. Chairman and the Members of the Subcommittee for your strong consideration regarding this testimony. I will be happy to provide you with any further information you might request or answer any questions that you or your staff may have. Again, thank-you and I appreciate any help you can afford for my district.

TESTIMONY
The Honorable Marcy Kaptur
Subcommittee on Surface Transportation
Committee on Public Works and Transportation
March 20, 1990

Chairman Mineta, Members of the Surface Transportation Subcommittee, thank you for allowing me the opportunity to appear before you today to discuss the upcoming reauthorization of Surface Transportation Programs.

The major complaint which I hear from my local officials and the general public on federal highway funds is that projects end up costing too much largely due to excessive federal rules and regulations which result in overly lengthy planning periods and cost- plus lengthy construction phases. The federal system of collecting highway dollars is very efficient. Thus, the next Transportation Act should make delivery of federal highway dollars more efficient and effective.

Background

Whether it is simply resurfacing one mile of an existing city street or constructing a major new expressway, using federal highway funds guarantees that a project will take two to three times as long as it would using local or state funds. Costs of projects triple and quadruple when federal funds are involved. Why?

Some specific examples in the Toledo metropolitan area are as follows.

o The City of Toledo can build a new major five land roadway such as Front Street in East Toledo in five years; with federal

funds it is estimated to take ten.

o The $45 million Buckeye Basin Greenbelt Parkway in North Toledo's inner harbor neighborhoods aimed at economic development and revitalization has been underway now for over 15 years. Most of the delay has come from changing federal regulations and laws.

o Toledo can resurface a street using local funds in a year or two from design through completion; it takes three or four years with federal funds.

o A $70,000 bikeway project in the City of Oregon turned into a $1 million street improvement project.

What Are The Issues?

Specifically, our local officials must fight their way through:

1. a labyrinth of federal regulations and laws,

2. lengthy bureaucratic interpretations of those regulations and laws,

3. changing regulations and laws and/or changing and/or inconsistent interpretations of those laws and regulations,

4. inflexible highway standards that may not change in specific situations,

5. the multiplicity of our federal and state agencies which must be involved.

The end result is a seemingly endless process of meeting the

original requirements, then the changing requirements. A project often winnows its way through an uncharted course and then with the ever increasing inflation, results in each street and highway project costing too much, costing much more than anticipated, and taking too long to plan and construct.

I am not suggesting that we eliminate the laws and regulations-- although making them less complicated might help. Rather, we need to set up a system to manage a project through the quagmire which has been created.

Specific Examples in the Metropolitan Toledo Area

Buckeye Basin Greenbelt Parkway

The Buckeye Basin Greenbelt Parkway is now a $45 million project immediately north of downtown Toledo. When constructed, it will (1) take trucks and through traffic out of one of the most historic neighborhoods in Toledo 2) open up land for economic development adjacent to the inner harbor of Toledo; 3) eliminate many old dumps by opening reclaimed land for business development 4) eliminate three dangerous railroad grade crossings on the major route into downtown Toledo from the north. The Parkway is supported strongly by local citizens and businesses. In fact, neighborhood residents requested that something be done to eliminate through traffic generated by I-280 through this neighborhood that created the concept for the project. The idea was born as an idea in the early 70's. The EIS was completed several years ago and is incorporated into

the design. But the Parkway is not built yet (after 15 years!) except for the overpass on I-280. The original cost was $25 million! So you can see what delays and inflation have done to ratchet costs up to the $45 million dollar figure.

While preparing the Environmental Impact Statement (EIS), the laws and regulations concerning the EIS changed significantly at least two times. Much of the document had to be rewritten. New issues had to be considered. Those changes cost the project several years and millions more dollars. More recently, as the project was ready for construction, the law on wetlands was reinterpreted. This impacted heavily on the project. I support preserving wetlands, but the ridiculous delays we have found ourselves subject to are unwarranted. The city is committed to this project. The state is committed to this project. But the federal government has no expedited review to ease the local dilemmas federal delay has caused. No rational system exists to manage the federal issues which have been raised.

The New Maumee River Crossing

The long range transportation plan for the Toledo Metropolitan Area was adopted by the Toledo Metropolitan Area Council of Governments (TMACOG) after two years of concentrated study, with input from hundreds of people in ten public meetings and hearings. Included in the plan are two new crossings of the Maumee River which bisects the area. The forecast of traffic indicates that almost all of the seven existing bridges would be heavily congested in twenty years. All but one of the bridges is

a state or federal route and three are on the Interstate System. I am pleased that the Maumee River Crossing has been placed on the Discretionary Bridge Candidate List by the Ohio Delegation.

The Craig Memorial Bridge which is a part of I-280 was built in the 50's before the Interstate System was conceived. In 1985, about 51,000 vehicles per day used this four lane bridge which is above a safe capacity. Projections indicate that traffic will almost double in the next twenty years.

The bridge is on a major Interstate link tying Detroit and points north in Michigan to points east and west along I-80 and I-90 which run from coast to coast. The current bridge not only serves the Interstate needs, but also serves local needs with interchanges at both ends of the bridge. The Craig Memorial bridge is a lift bridge- one of only two on the entire Interstate System! It is a bottleneck of major proportion. It was designed before the St. Lawrence Seaway was opened. It now has to be opened regularly for both ships going to the Port of Toledo grain elevators upstream and for pleasure craft which have grown in numbers over the last few years. Further, it has been undergoing major maintenance which has been restricting the capacity to one lane in each direction for a number of years. By the turn of the century, this bridge will be 50 years old.

To make matters worse, it is currently carrying Michigan truckloads. Trucks in Michigan are allowed to be much heavier than those throughout the rest of the U.S. To be competitive, we in Ohio must accommodate those heavier loads on the Toledo area expressway system, including this lift bridge.

The long range plan calls for either a new Maumee River

Crossing downstream, from the Craig Memorial Bridge-- or replacing the existing bridge. The estimated cost is between $100 and $200 million which is beyond the projected available federal, state, and local funds available, given consideration of other transportation needs in the area.

This is the most important highway project in metropolitan Toledo since the Interstate System was designed and built in the sixties and seventies. It has been decided to start this project with state and local funds. Further, and unfortunately, one of the driving factors in this project is to investigate all types of non-federal funding for this project since using federal funds on this project would mean endless regulations and strings attached. This ultimately means that the Toledo area would not avail itself of federal funds to build the biggest and most important highway project in thirty years. This is absolutely wrong. Our citizens pay federal taxes too.

Through the Toledo Metropolitan Area Council of Governments-our state and federally designated Metropolitan Planning Organization (MPO)-- the City of Toledo, the City of Oregon, Lucas County, and the state of Ohio are providing $930,000 for a Feasibility Study. TMACOG is providing $176,000 of federal and state planning funds for a total of $1.1 million for the study. The study will include determining a location for the new facility, determining the type of financing such as public or private, toll or free.

TMACOG put together a local management team in April, 1989 made up of a cross section of local elected and appointed

officials, citizens, and bus[illegible]ersons. Working with this twenty person team, the consu[illegible]as hired in March 1990. If federal funds had been used a[illegible] year would have been lost before the consultant would b[illegible] contract. The current schedule calls for completion of the feasibility study by Mid-1991. Environmental and engineering documents can then be started in 1991, with completion possible in 1994. Everyone agrees that this is much faster than had the area used federal funds. How sad.

The feeling among Toledo area public officials is that we can do it faster without federal funds, and we need the project completed in a reasonable time frame. On the other hand, it is not fair to the Toledo area to have to build a major new interstate project on its own.

ENVIRONMENTAL IMPACT STATEMENTS

Environmental Impact Statements which are written for federally funded highway projects are quite voluminous and time-consuming. It is my understanding that the Department of Transportation has decided to prepare every EIS so that it can stand up in court. Yet, less than 5% of the highway projects end up in court. This policy needs to change to decrease regulation and paperwork. Each project EIS should be prepared to meet the requirements of existing laws and regulations. Then, when a project does go to court, the additional work will need to be funded. In the long run, this is cheaper and more efficient.

DISTRIBUTION OF FEDERAL AND HIGHWAY FUNDS TO STATES

Finally, I join with my Ohio colleagues in requesting that changes be made in the formulas used to distribute highway and federal bridge funds. The current distribution formulas for Federal Aid Highway funds, with some exceptions, were conceived and placed into law when federal aid to highways first became a federal issue in the early 1900s. Many of the formulas have no relationship to the current highway system and transportation needs. These formulas need to be changed to more fairly distribute the federal highway funds to states.

The formulas should be based upon travel, existing facilities, and need. Two formulas deserve reformulation. First is the formula which allocates 4R funds to our interstate system. It includes lane miles of roadway, a measurement of the extent or size of the network, and vehicle miles of travel, which measures highways used. Similarly, bridge funds are allocated to the states based on the number and cost to repair/replace deficient bridges.

Ohio is one of the most urbanized states in the country. Yet urban population is not a significant factor in any of our current formulas. If we survey our transportation systems today, many of the major problems are in our metropolitan regions such as Toledo where old county two lane roads are being destroyed by burgeoning traffic. People continue to leave the cities to move to the suburbs. Industry is moving to the suburbs. The end result is a major increase in cross region traffic, suburban traffic snarls, and the inability of our urban poor to get to

jobs in the suburbs. The proper distribution of highway and transit funds must reflect (1) that our urban population is now the majority of our population in the country and (2) that it is urban areas where many of our current transportation problems exist.

Another factor in the Toledo area is managing the interrelationships between the various transportation modes such as air, rail, water, and highway. The Port of Toledo is one of the largest ports in the United States and the second largest on the Great Lakes. Toledo is also one of the largest rail hubs in the U.S. The end result is countless conflicts between the various modes of traffic. Ships interfere with rail traffic. Rail traffic interferes with highway traffic. Toledo, and other port areas, needs funding for planning and development of intermodal facilities to eliminate the conflicts between modes which assist in international trade and interstate commerce.

The Toledo area needs to build several highway/rail grade separations. We also need a new grade separation into the Port of Toledo general cargo facility which is frequently blocked by the CSX mainline.

If we cannot change the formulas, then there is a fall back position. We in Ohio- in the Toledo area- deserve a larger share of the federal highway funds. Currently, Ohio receives back only 85 cents of every dollar it sends to Washington. It would be less if we did not have in existing law the requirement that, at the minimum, we receive this 85%. The limit needs to be raised at the very least. It should be 90% so that our urban populations receive their fair share, then our rural areas can

rebuild the farm to market roads, and we can manage our intermodal conflicts.

TRANSIT

Mr. Chairman, I would also like to briefly discuss the difficulty that my local transport officials are experiencing as they struggle to provide quality services with fewer and fewer resources.

Over the past several years, federal funding of mass transit has been cut to the point where public transit authorities can no longer continue present operations and needed bus replacements. We are seeing a deterioration in the bus fleets of our cities. The reason is evident. The American transit systems no longer have adequate resources necessary to properly maintain their fleets.

Over the past decade, federal funding for mass transit has been reduced by over 50% in real terms. Yet improvements are drastically needed. With the reauthorization of the surface transportation bill, the opportunity presents itself for us to lay out a foundation that will begin to solve many of these problems.

The current federal funding level for mass transit is $3.1 Billion. In 1981, this amount was $4.1 Billion. Just to bring us back to the 1981 level, the funding for mass transit would have to be $6.5 Billion.

Above all, there exists a need to continue the federal operating assistance within the program. If operating assistance were discontinued in Toledo, the Toledo Area Regional Transit

Authority would have to begin an immediate reduction in service to accommodate that loss. There would not be sufficient local funds to meet the transit demands of the community. However, beyond this, the operating cap should be removed for small urban systems, thus allowing them the flexibility of using the federal funds available where the local community believes they should be used.

Mr. Chairman, thank you again for the opportunity to testify this morning. I look forward to working with you and the Members of the Subcommittee in the coming year.

Chairman Mineta, Members of the Surface Transportation Subcommittee, it is an honor to appear before you today. Thank you for the time you have provided for me to speak before you this morning.

I join with my Ohio colleagues in requesting changes in the formulas used to distribute federal highway and bridge funds.

Having served as President of the Ohio Senate for six years, I understand formula changes are extraordinarily difficult to enact, especially without new revenue. I am convinced that the costs of continuing current policy are so high that corrective action must be taken. Revising formulas in this reauthorization bill may be a lot easier -- and cheaper -- than delay.

U.S. DOT statistics indicate that serious deficiencies in our highway system are increasingly concentrated in donor states. Department of Commerce data confirms that the 19 donor states generate more than half of the industrial and agricultural production, and more than half of the service business, in the United States.

This indicates that the majority of U.S. workers, as well as the majority of U.S. goods shipped by truck to foreign and domestic markets, must travel on increasingly inadequate

highways and bridges. In short, we are not putting our federal transportation dollars where they are needed most. Nor are we investing our federal transportation dollars where they will give us, as a nation, the greatest economic benefit.

If current funding distribution practices are allowed to continue, our surface transport problems will not only worsen, but may do so at a much faster rate. The cost of postponed highway and bridge repair accelerates almost exponentially. At the same time, unless we change the way federal transportation funds are distributed, the states with the worst problems will continue to have the least money available to solve those problems.

As you will see, this is the case for donor states which have substantially increased their state and local user fees. Ohio has raised its state gas tax 6 times in the last ten years, from 7 cents a gallon in 1980 to 18 cents a gallon in 1989. An additional increase of 2 cents a gallon goes into effect July 1 of this year. The impact of these increases is a tripling of the state gas tax, and a doubling of the federal gas tax.

Even with such huge increases, donor states like Ohio cannot make up their shortfall in federal funding fast enough to keep up with the problem. Nor should they have to.

Why should Ohioans pay 20 cents a gallon in state gas tax, in

addition to the 9 cents in federal gas tax -- and still bear the burden of a disproportionate share of America's hazardous roads and bridges ?

Current law directs discretionary funding to states which already receive the most back on their federal gas taxes and highway user fees. The states that get the largest proportion of federal aid by formula also get exclusive access to discretionary assistance.

Having seen in recent years significant increases in the Ohio state gas tax, I am particularly distressed that states which enjoy this exclusive access to discretionary federal highway and bridge aid often have far lower state and local user fees than Ohio. This means that donor state user fees become transfer payments to other states which use this transferred income in lieu of raising their own state and local taxes.

Clearly discretionary funds should go where there is the greatest need. Eliminating the requirement that donor states pay back an equivalent amount of Minimum Allocation dollars for every dollar of discretionary funds would help ensure that this need is met.

However, this action alone is not enough to correct the pervasive pattern of disinvestment in donor states. Donor states account for more than 60% of the interstate miles travelled annually in this country. As well, donor states

account for more than 57% of the travel on the Primary system, more than 59% of travel on the Urban system, and more than 62% of travel on the Secondary system.

I would not presume to suggest to this committee what factors to consider when examining the formulas, but any rational change which disburses funds in ways more closely related to the extent of use of federal highways will help to alleviate this problem.

If formulas cannot be changed, we are asking that Minimum Allocation be increased from 85% to 90%. This is not sufficient to correct the trend toward concentration of deficiencies in donor states, but it is enough to slow down the rate of deterioration.

I am pleased that the Ohio delegation has seen fit to include replacement of the lift bridge on I-280 in Toledo on its list of structures put forward for discretionary funds. This structure is one of only two lift bridges on the entire interstate system. It carries more than 18.2 million vehicles per year, and with only four lanes, is a direct link for Michigan industries to Interstate 80 and Interstate 90.

I recognize that inclusion of the I-280 bridge on the national bridge list does not automatically ensure award of discretionary funds. Given the large amounts of both intra-state and out-of-state traffic carried on this link, together with the very high cost of the project, it seems an

excellent candidate for federal discretionary investment.

Thank you for your time and consideration this morning. I look forward to working with the Members of the Subcommittee as this bill moves through the House. Any appropriate changes you elect to make in distribution formulas will have my support.

Mr. MINETA. The chair has been given a statement from Representative Michael G. Oxley of Ohio for inclusion in the record. If there is no objection, I will insert that statement in the record at this point.

[Mr. Oxley's prepared statement follows:]

TESTIMONY OF CONGRESSMAN MICHAEL G. OXLEY

SUBMITTED TO THE

SUBCOMMITTEE ON SURFACE TRANSPORTATION

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

CONCERNING

REAUTHORIZATION OF THE SURFACE TRANSPORTATION AND UNIFORM RELOCATION ASSISTANCE ACT

CHAIRMAN MINETA, MEMBERS OF THE SUBCOMMITTEE, IT IS A PRIVILEGE TO SHARE WITH YOU MY CONCERNS IN REGARD TO REAUTHORIZATION OF THE SURFACE TRANSPORTATION AND UNIFORM RELOCATION ASSISTANCE ACT.

WITH THE INTERSTATE SYSTEM ESSENTIALLY COMPLETE, WE IN CONGRESS HAVE AN OBLIGATION TO REEXAMINE THE FEDERAL TRANSPORTATION PROGRAM. WE ARE IN AN ERA MARKED BY RAPID AND DRAMATIC CHANGE, INCREASING PRESSURE TO PERFORM AND SUCCEED IN INTERNATIONAL MARKETS, AND THE NEED TO EXERCISE FISCAL RESTRAINT. THIS IS A VERY DIFFERENT FRAMEWORK THAN EXISTED WHEN WE UNDERTOOK TO BUILD THE INTERSTATE SYSTEM IN 1956.

SINCE 1956 THE NATION'S ECONOMY, DEMOGRAPHICS, INSTITUTIONS, TRAVEL PATTERNS, AND INTERNATIONAL AGENDA HAVE CHANGED IN FUNDAMENTAL WAYS. BUT, ALTHOUGH WE INCREASED THE SIZE OF THE FEDERAL HIGHWAY PROGRAM BY DOUBLING THE FEDERAL GAS TAX IN 1982, THE GOALS, POLICIES, AND PRACTICES WHICH SHAPE THIS PROGRAM HAVE REMAINED BASICALLY UNCHANGED FOR 36 YEARS.

IT IS TIME WE REDIRECTED THE IMMENSE RESOURCES OF THE HIGHWAY TRUST FUND TOWARD ACHIEVEMENT OF THE GOALS OF A MODERN GENERATION. TO FAIL IN THIS MISSION IS TO MAKE THE SAME MISTAKE THE U.S. AUTO INDUSTRY MADE IN THE 1960S. THEY KEPT ON DOING THE SAME OLD THINGS IN THE SAME OLD WAY, BECAUSE THE OLD WAYS HAD MADE AMERICA THE BEST IN THE WORLD.

SOME VERY SMART AMERICANS MISSED THE IMMENSE CHALLENGE POSED BY EFFECTIVE AND PERSISTENT FOREIGN COMPETITION. AS A NATION, WE PAID A TREMENDOUS PRICE FOR THIS MISTAKE. FOR SOME PARTS OF THIS COUNTRY, INCLUDING THE 4TH DISTRICT OF OHIO, IT IS A LESSON WE'LL NEVER FORGET.

TODAY, WE FACE A SIMILAR CHALLENGE ON A SCALE WHICH THREATENS OUR ENTIRE ECONOMY. WE CAN'T AFFORD TO MAKE THE SAME MISTAKE THAT WAS MADE IN THE 1960S. WE AS A NATION MUST RECOGNIZE THE COMPETENCE AND EARNESTNESS OF OUR COMPETITION. WE MUST ACKNOWLEDGE THE RISKS AND COSTS OF DELAY.

AND WE IN CONGRESS MUST DO A VERY DIFFICULT THING - WE MUST CHANGE DIRECTION. WE MUST USE THE IMMENSE POWER OF AMERICAN RESOURCES TO DO NEW THINGS QUICKLY AND WELL, TO DO OLD THINGS BETTER, AND TO DO IT ALL WITHOUT RAISING TAXES.

FOR THESE REASONS, I AM PLEASED TO HAVE THE OPPORTUNITY TO DISCUSS WITH YOU THE SPECIFIC TRANSPORTATION ISSUES OF GREATEST CONCERN TO THE 4TH DISTRICT OF OHIO. I AM OFFERING ALSO A SET OF SPECIFIC PROPOSALS FOR YOUR CONSIDERATION. THESE SUGGESTIONS REPRESENT THE SHARED VIEW OF BOTH LOCAL ELECTED OFFICIALS AND THE BUSINESS COMMUNITY.

FIRST, I JOIN WITH MY OHIO COLLEAGUES IN REQUESTING CHANGES IN THE FORMULAS USED TO DISTRIBUTE FEDERAL HIGHWAY FUNDS. THE INEQUITIES IN THE EXISTING PROGRAM ARE SO GREAT THAT ALMOST ANY MEANINGFUL CHANGE IN FORMULAS BASED ON UP-TO-DATE MEASURES OF NEED WILL HELP OHIO AND MOST OF THE OTHER DONOR STATES.

U.S. DOT STATISTICS CONFIRM THAT STATES SUCH AS OHIO, WHICH HAVE ENDURED YEARS OF FEDERAL DISINVESTMENT AND WHICH CARRY HEAVY VOLUMES OF TRAFFIC, HAVE AN INCREASINGLY LARGER PROPORTION OF THE NATION'S DEFICIENT BRIDGES AND HIGHWAYS.

UNLESS FORMULAS ARE CHANGED, THE CONCENTRATION OF DEFICIENCIES IN DONOR STATES WILL ACCELERATE. BECAUSE THE COSTS OF REPAIR ESCALATE RAPIDLY, THE CONDITION OF THE NATION'S HIGHWAY NETWORK WILL DETERIORATE UNLESS THESE DEFICIENCIES ARE CORRECTED.

WITH THE COST OF TRANSPORTATION CONTRIBUTING UP TO 25% OF THE COST OF OUR EXPORT GOODS, WE CAN'T COMPETE IN WORLD MARKETS UNLESS HIGHWAY DISTRIBUTION FORMULAS ARE CHANGED.

SPECIFICALLY, FORMULAS SHOULD BE AMENDED TO REFLECT:

- PROPORTIONATE SHARE OF TOTAL U.S. VEHICLE MILES OF TRAVEL;
- PROPORTIONATE SHARE OF TOTAL U.S. DEFICIENT MILES OF FEDERAL-AID HIGHWAYS;
- PROPORTIONATE SHARE OF THE VALUE OF U.S. EXPORTS; AND
- PROPORTIONATE SHARE OF U.S. POPULATION.

IF UPDATED FORMULAS CANNOT BE AGREED UPON, THEN THE MINIMUM ALLOCATION PROGRAM SHOULD BE INCREASED FROM 85% TO 90% OF THE VALUE OF ANY GIVEN STATE'S CONTRIBUTION TO THE TRUST FUND. BY VALUE OF A STATE'S CONTRIBUTION, I MEAN THE AMOUNT IT FORWARDS TO WASHINGTON IN USER FEES PLUS A PROPORTIONATE SHARE OF THE INTEREST EARNED EACH YEAR BY THE HIGHWAY TRUST FUND.

SECOND, I JOIN CONGRESSMAN GILMOR IN PROPOSING THAT A BONUS PROGRAM BE ESTABLISHED AS AN INCENTIVE REWARD FOR STATES AND LOCALITIES WHICH HAVE INCREASED STATE AND LOCAL USER FEES AND TAXES DEDICATED TO TRANSPORTATION. IT IS REMARKABLE THAT OHIO, WHICH HAS CONTRIBUTED BILLIONS MORE TO BUILDING U.S. HIGHWAYS THAN IT HAS RECEIVED IN RETURN OF FEDERAL HIGHWAY AID, GETS NO RECOGNITION OR REWARD FOR HAVING ONE OF THE LARGEST STATE AND LOCAL INFRASTRUCTURE EFFORTS OF ANY STATE.

INSTEAD WE ARE ASKED TO INCREASE THE STATE AND LOCAL SHARE SO THAT FEDERAL PARTICIPATION IN HIGHWAY, BRIDGE, AND TRANSIT PROJECTS CAN BE REDUCED. I DO NOT THINK REDUCING FEDERAL PARTICIPATION TO 50% IS A WORKABLE SOLUTION.

SMALL COMMUNITIES AND RURAL AREAS SUCH AS THOSE IN OHIO'S 4TH DISTRICT SIMPLE DO NOT HAVE THE FINANCIAL RESOURCES TO ABSORB SUCH A DRAMATIC REDUCTION IN FEDERAL AID. THIS IS ESPECIALLY TRUE IN VIEW OF THE FACT THAT OHIOANS ALREADY BEAR THE COSTS OF A 20 CENT PER GALLON STATE GAS TAX, MILLIONS OF DOLLARS IN BOND ISSUES FOR ROAD AND BRIDGE REPAIR, AND HIGHWAY COUNTY VEHICLE REGISTRATION FEES TO SUPPORT TRANSPORTATION.

EVEN THIS REMARKABLE LEVEL OF STATE AND LOCAL EFFORT LEAVES OHIO FAR SHORT OF THE AMOUNTS NEEDED TO PROVIDE NECESSARY HIGHWAY AND BRIDGE CAPACITY.

IN MY OWN DISTRICT, WE HAVE BEEN WORKING WITH THE OHIO DEPARTMENT OF TRANSPORTATION AND FHWA FOR YEARS TO WIDEN SR 30. THIS IS A CRITICAL CONNECTING ROUTE FOR A LARGE NUMBER OF AUTO PARTS SUPPLIERS WHO MANUFACTURE AND DELIVER PARTS FOR MAJOR AUTOMOTIVE AND TRUCK PLANTS IN OHIO AND MICHIGAN.

INCREASINGLY, THESE PLANTS ARE USING INNOVATIVE TECHNOLOGIES WHICH REQUIRE "JUST IN TIME" DELIVERY OF PARTS FOR ASSEMBLY LINES. THIS PUTS INCREDIBLE PRESSURE ON PARTS MANUFACTURERS AND SUPPLIERS FOR ON-TIME DELIVERY. THIS, IN TURN, PUTS INCREDIBLE PRESSURE ON OUR TRANSPORTATION SYSTEM, ESPECIALLY SR 30.

THESE AUTO SUPPLIERS ARE A MAJOR SOURCE OF EMPLOYMENT IN MY DISTRICT. MARCH 20 GOVERNOR CELESTE COMMITTED STATE FUNDS TO THE PROJECT, BUT WE ARE STILL FAR SHORT OF WHAT IS NEEDED TO ACCOMMODATE EVEN CURRENT TRAFFIC.

MANY OF THE BUSINESSES IN MY DISTRICT ARE WORKING HARD TO INCREASE BUSINESS. WE SHOULD HELP THEM IN EVERY WAY WE CAN, PARTICULARLY NOW THAT THE EXPORT MARKET FOR U.S.-MADE CARS AND TRUCKS IS INCREASING. YET, ONE OF THE MAJOR OBSTACLES TO ACHIEVING THIS GOAL REMAINS THE LIMITED CAPACITY OF SR 30.

UNFORTUNATELY, THIS SITUATION IS NOT UNIQUE. THERE ARE HUNDREDS OF SIMILAR PROBLEMS THROUGHOUT THE NINETEEN DONOR STATES. IN THE NEXT REAUTHORIZATION BILL, WE MUST PUT OUR TRANSPORTATION RESOURCES WHERE THEY ARE NEEDED MOST - SO THERE ARE SUFFICIENT FUNDS FOR PROJECTS LIKE THE WIDENING OF SR 30. OTHERWISE, OUT EFFORTS TO IMPROVE THE BALANCE OF TRADE WILL BE WASTED, AND JOBS WILL BE LOST.

THIRDLY, I AGREE WITH MANY EXPERTS IN THE FIELD OF TRANSPORTATION THAT THE PENALTY LEVIED ON MINIMUM ALLOCATION STATES WHICH PURSUE DISCRETIONARY FUNDING SHOULD BE ABOLISHED.

DISCRETIONARY FUNDS, AS A MATTER OF NATIONAL INTEREST, ARE SUPPOSED TO BE DIRECTED TO CORRECTING THE MOST SEVERE TRANSPORTATION SYSTEM PROBLEMS IN THE COUNTRY. BY THAT CRITERION, DONOR STATES ARE LIKELY TO BE VERY DESERVING RECIPIENTS, BECAUSE DONOR STATES HAVE MORE THAN HALF OF THE MOST HAZARDOUS AND DEFICIENT FACILITIES IN THE U.S. YET DONOR STATES, BY LAW, ARE UNABLE TO ENJOY THE BENEFITS OF DISCRETIONARY ASSISTANCE. THIS NEEDS TO BE CORRECTED.

AS A COROLLARY TO THIS POINT, I ADD MY SUPPORT FOR ADDITION OF THE TEN BRIDGES IN OHIO TO THE NATIONAL BR DISCRETIONARY LIST. THIS IS NOT A REQUEST FOR "DEMO PROJECTS." RATHER, IT IS OHIO'S LIST OF ELIGIBLE CANDIDATES FOR A PROGRAM OF NATIONAL INTEREST OPEN TO ALL STATES.

I WOULD ALSO NOTE THAT, AS THE LAW NOW STANDS, STATES WHICH RECEIVE EMERGENCY FUNDS HAVE THESE FUNDS COUNTED AGAINST RECEIPT OF FUTURE MINIMUM ALLOCATION DOLLARS. WHY MUST A STATE WHICH HAS SUFFERED THE CONSEQUENCES OF SOME EVENT NECESSITATING EMERGENCY RELIEF BY FURTHER PENALIZED BY HAVING ITS MINIMUM ALLOCATION FOR THE NEXT YEAR REDUCED? ALTHOUGH OHIO HAS BEEN FORTUNATE ENOUGH NOT TO NEED EMERGENCY HIGHWAY FUNDING IN RECENT YEARS, WE HAVE BEEN KNOWN TO HAVE TORNADOES.

IT HAS BEEN BROUGHT TO MY ATTENTION THAT ABOUT 22% OF THE EXPENDITURES OF THE HIGHWAY TRUST FUND ARE ALLOCATED TO NEW INTERSTATE CONSTRUCTION, WHILE ONLY ABOUT 11% OF THE EXPENDITURES ARE DIRECTED TOWARD THE FORMULA BRIDGE PROGRAM. THE AMOUNT OF FUNDING DIRECTED TO BRIDGE REPAIR SEEMS DISPROPORTIONATELY SMALL COMPARED TO WHAT IS EXPENDED TO FINISH THAT LAST FEW MILES OF INTERSTATE.

U.S. DOT STATISTICS, TOGETHER WITH VARIOUS REPORTS OF THE HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE, CONFIRM THE VERY LARGE NUMBER OF BRIDGES IN THE NATIONAL FEDERAL-AID SYSTEM, THE FACT THAT MANY OF THESE STRUCTURES ARE NEAR THE END OF THEIR DESIGN LIFE, AND THAT THESE BRIDGES PROVIDE CRITICAL LINKS IN COMMERCIAL AND PERSONAL TRAVEL. IN VIEW OF THIS, IT MAY BE APPROPRIATE IN TERMS OF SAFETY AND U.S. COMPETITIVENESS TO DIRECT MORE FUNDS TO BRIDGE REPAIR, AND LESS TO COMPLETION OF THOSE LAST FEW LINKS OF INTERSTATE HIGHWAY. PERHAPS THE FEDERAL SHARE OF THESE LAST FEW INTEREST LINKS COULD BE REDUCED SO THAT OVERALL INVESTMENT OF THE HIGHWAY TRUST FUND CAN BE BETTER FOCUSED ON MEETING NATIONAL NEEDS.

FINALLY, MY WORK ON THE CLEAN AIR ACT AMENDMENTS HAS CONVINCED ME THAT ENVIRONMENTAL CLEANUP CAN AND MUST BE ACHIEVED AT REASONABLE COSTS. THERE ARE SEVERAL ACTIONS OUTSIDE THE PURVIEW OF THE CLEAN AIR ACT WHICH COULD CONTRIBUTE TO REDUCING AIR POLLUTION WITHOUT INCREASING FEDERAL EXPENDITURES, ADDING FEES, OR RAISING TAXES. IF A PORTION OF FEDERAL HIGHWAY AID WERE DIRECTED TO PROJECTS SPECIFICALLY DESIGNED TO REDUCE TRAFFIC CONGESTION, MOBILE SOURCE POLLUTION COULD BE REDUCED DRAMATICALLY. OTHER MEMBERS OF THE OHIO DELEGATION HAVE FORWARDED TO YOU DATA CONFIRMING THE COST-EFFECTIVENESS OF VARIOUS MEANS OF REDUCING TRAFFIC CONGESTION. SUCH ACTIONS COULD PROVIDE SUBSTANTIAL ENVIRONMENTAL BENEFIT WITHOUT ADDING ONE EXTRA DOLLAR TO THE DEFICIT OR INCREASING ANY FEDERAL FEES OR TAXES.

IN CLOSING, IT MAY BE APPROPRIATE TO ALLOW STATES WITH AIR POLLUTION PROBLEMS TO USE MORE THAN ONE-HALF OF ONE PERCENT OF THEIR FEDERAL HIGHWAY FUNDING ALLOTMENTS FOR PLANNING. THE COORDINATED PROCESS IN WHICH TRANSPORTATION SYSTEM REPAIR, IMPROVEMENT, AND FINANCING IS PLANNED, (23 U.S.C. 134), WILL BE MUCH MORE COMPLEX AS TRANSPORTATION CONTROL MEASURES AND HIGHER AIR QUALITY STANDARDS ARE IMPLEMENTED IN COMPLIANCE WITH THE NEXT CLEAN AIR ACT AMENDMENTS.

THANK YOU FOR YOUR TIME AND CONSIDERATION.

Mr. MINETA. At this point I would like to call forward a panel from the American Public Transit Association. We have Daniel T. Scannell, the Chair of APTA and First Vice Chairman of the Metropolitan Transportation Authority of New York City; Richard F. Davis, Chairman of the Legislative Committee of the American Public Transit Association and General Manager of the Kansas City Area Transportation Authority; Rod Diridon, Chairman of the Coalition Building and Advocacy Legislative Subcommittee of APTA and Chairman of the Santa Clara County Board of Supervisors, my representative on the County Board of Supervisors in my area; Irving Smith, Association Member of the Board of Governors of the American Public Transit Association and President of Smith and Howard Associates of McLean, Virginia; Dennis D. Louwerse, Chairman, Small Operations Steering Committee of APTA and Executive Director of the Berks Area Reading Transportation Authority, Reading, Pennsylvania; and Hershel Payne, who I believe is not going to be here. Is that correct, Mr. Gilstrap?

Mr. GILSTRAP. Yes, sir.

Mr. MINETA. And Jack Gilstrap, of course, the head of the American Public Transit Association.

Mr. MINETA. At this point I turn to the chairman of the American Public Transit Association, Mr. Scannell.

Sir, you proceed in your own fashion.

TESTIMONY OF DANIEL T. SCANNELL, CHAIRMAN, AMERICAN PUBLIC TRANSIT ASSOCIATION, [APTA], ACCOMPANIED BY RICHARD F. DAVIS, CHAIRMAN, LEGISLATIVE COMMITTEE, APTA, ROD DIRIDON, CHAIRMAN, COALITION BUILDING AND ADVOCACY LEGISLATIVE SUBCOMMITTEE, APTA; IRVING SMITH, MEMBER, ASSOCIATE MEMBER BOARD OF GOVERNORS, APTA; DENNIS D. LOUWERSE, CHAIRMAN, SMALL OPERATIONS STEERING COMMITTEE, APTA; AND JACK R. GILSTRAP, EXECUTIVE VICE PRESIDENT, APTA

Mr. SCANNELL. Chairman Mineta and members of the committee, the American Public Transit Association, commonly known as APTA, is pleased to have this opportunity to testify on reauthorization of the Federal transit and highway program.

I next have the litany of saints, but fortunately you listed all of the people who are sitting here with me and who are going to be ready to answer any questions.

If it pleases the committee, I would like to summarize APTA's written statement which, along with its two appendices, we would like to submit for the record.

Mr. MINETA. Without objection, the full testimony will be made a part of the record.

Mr. SCANNELL. Thank you, Mr. Chairman.

Mr. Chairman and members of the committee, our message today is a simple one: public transportation must become a key component of the nation's infrastructure and transportation system.

We, as representatives of the public transit industry, have sounded this theme repeatedly. Unfortunately, we have had to do in a budgetary and political environment that repeatedly threatens the wholesale demise of public transit in America.

To a very considerable degree, Congress—and particularly you, Mr. Chairman, and members of this subcommittee—has persisted in the view that the Federal Government must remain a full and responsive partner in supporting public transit.

On behalf of the riders and communities we serve, we thank you again.

Today, Mr. Chairman, the environment in which we find ourselves has changed. The focus of national interest is on our competitiveness as a world economic force and on the quality of our environment. What we have come to realize is that outdated and deteriorating infrastructure and our increasing inability to move with ease across town and across the country is doing dangerous and serious damage to both.

The centerpiece of our Transit 2000 work revolves around seven key points.

First, the concept and definition of transit must be broadened to include all forms of high-occupancy shared-ride services.

Second, we must set clear and explicit goals, beginning at the Federal level, to increase substantially the availability and use of all transit services.

Third, greater transit availability and use must be underwritten by major increases in transit investment led by the Federal Government through an increase of $0.07 in Federal motor fuels taxes to be invested in transit, half of which increase is needed to restore the program to its 1980 level.

Fourth, the delivery of Federal transportation funds must be channelled more directly to our nation's metropolitan and rural areas and local officials given more authority in their use.

Fifth, greater flexibility in the use of funds must be provided to facilitate rational and thoughtful local decisions.

Sixth, in addition to direct investment, Federal policy in a host of areas—tax, energy, economic development, air quality—must reinforce and support our transit and transportation investments rather than diminish their effectiveness.

Seventh, the promise of planning, service, and technological innovations is only as bright as the strength of the commitment to research and development.

If we review the transportation policies and programs in place today, it is clear that we are advocating major changes. Our written statement describes in greater detail why we believe these changes are vitally needed and what direction should be taken in restructuring the nation's transit and highway programs.

I would like to establish briefly the background for our recommendations.

The detailed conclusions of the task force are contained in a report entitled "Managing Mobility: a New Generation of National Policies for the 21st Century" which was issued last November and which we have included as an appendix in our written statement.

In offering our conclusions, it is our intention to outline bold, aggressive, and innovative policies that will allow our nation's public transportation systems and services to meet fully the challenges and opportunities that lie ahead.

I should also point out that APTA has participated extensively in the deliberations of the Transportation Alternatives Group—TAG.

The TAG process involved over two years of wide-ranging discussion among 12 public interest groups having major interest in the nation's future transportation policy and Federal programs affecting primarily mass transit and highways.

We generally support the policy positions endorsed by the TAG but believe additional direction and action at the Federal level is needed beyond the limited consensus that was reached in the TAG process to ensure expansion of transit's role in meeting national goals.

We have also reviewed carefully the Administration's recently released national transportation policy. While we are encouraged that the Administration recognizes the need for a national transportation strategy for the 1990s and beyond, but put it bluntly they are offering us long on advice and short on help.

We are very disappointed with the view that the Federal Government should reduce its promotion and funding of mass transit service and turn over to cities and States the main responsibility for dealing with this critical national issue.

We had high expectations during the last year's nationwide series of public hearings when dozens of individuals and groups called on the Federal Government to take a higher profile on mass transit.

More and better bus, subway, carpool, and other ride-sharing services were identified as important solutions to those problems, but not worthy of even continued levels of Federal support.

The Administration's policy projects Uncle Sam as a very junior partner in the traditional inter-governmental alliance that has underwritten mass transit for more than 25 years. It also falls short by not establishing a national goal of more transit use as an alternative to the private automobile by not proposing increased Federal investment in mass transit and ride-sharing services, by not offering to cover the expense of costly Federal mandates affecting transit such as the provision of the accessible service and tailpipe emission improvements, and, lastly, by not proposing specific tax code changes which would encourage private investment in transit and give equal treatment to transit and auto parking employment benefits.

Even in the face of a proposed reduction in the Federal role, however, the policy is clear on one point with which we agree, and that is the recognition of the inadequacy of the current trust fund balances as a sufficient long-term funding for meeting either transit or highway needs.

The policy report states clearly that "the total uncommitted balances represent significantly less than one year of Federal spending on highways, aviation, and transit."

APTA has prepared an analysis of the trust fund balances and has submitted it as an additional appendix to our written statement.

Despite the inadequacy of trust fund balances, however, we agree that in future years, beginning with the reauthorization of the Federal surface transportation program, all—and we underscore all—available revenues in the trust fund, including annual receipts, accumulating interest, and current balances, must be committed fully

38-253 O—91——34

for the uses they were intended, including transit, and not be diverted to deficit reductions or other purposes.

Finally, in considering the reauthorization of the UMTA program, Congress must ensure that existing regulatory requirements are reviewed and that any new requirements are fully evaluated so that it can be confident that transit operators throughout the United States are not overburdened by regulation to such an extent that they cannot provide essential transit services to their customers.

In issuing regulations, all Federal agencies—and especially UMTA—must carefully provide the affected industry with a real opportunity to shape proposed regulations, and the Federal agencies must give stronger consideration to the views of the affected industry when final rules are issued. This is particularly important in the face of often-competing and sometimes conflicting regulations that increase cost, limit revenues, and restrain ridership growth.

APTA will be reviewing the existing regulatory arena affecting transit and make specific regulations to this committee concerning revisions to the statutory framework behind these regulations and to ensure that transit can serve its customers fully in the most effective means possible.

In conclusion, Mr. Chairman, we have an unprecedented opportunity to shape a new, comprehensive, Federal transportation policy and program to serve this great nation of ours as we approach the 21st Century. We commend to you the Transit 2000 concept outlined in our written statement and we welcome the opportunity to work with you and your distinguished committee, as well as others within the transportation community to accomplish this exciting and challenging task.

I and my colleagues welcome any questions you or your committee may wish to ask of us.

Again, thank you for the opportunity to appear before you to offer the views of the transit industry. Thank you very much.

Mr. MINETA. Thank you very much Mr. Scannell, for your very comprehensive testimony.

Your reference to the Highway Trust Fund surplus will also be made a part of the record.

Let me again welcome the total panel.

Mr. Chairman, if I might, I will be directing questions to the Chair, to you as the Chair of the American Public Transit Association. I assume you will have members of your own panel responding to these because I will probably not be directing them to any specific member of the panel. So I want members of the panel to feel free to join in the discussion.

Now, I assume that you are emphasizing the inadequacy of increasing highway and transit spending only up to the level that drawing down the Highway Trust Fund surplus would allow in order to underscore the need for a greater Federal commitment to transit programs, including the $0.07 gasoline tax increase which APTA is proposing.

However, in light of the President's pledge of no new taxes, isn't spending down the trust fund surplus better than nothing?

Mr. SCANNELL. I will ask Mr. Diridon to respond to that, please.

Mr. MINETA. Mr. Diridon?

Mr. DIRIDON. Mr. Chairman, it is nice to be here with you again, my Congressman.

First, let us stress that it would take a substantial increase in current spending just to bring transit back to its 1980 level. In 1980 there was about $4 billion a year spent on mass transportation funding; we are down to $3 billion now, which is an effective 50 percent cut in buying power. If we were to be just back at that $4 billion in buying power of 1980 we would have to be at $6.5 billion now. That is an increase which, if maintained even over a few years, would exhaust the Transit Trust Fund.

We know that, and yet we realize that $6.5 billion is inadequate because of the deferred maintenance and lack of construction that has occurred over the last decade. As a consequence we have no choice but to come to you and ask for an increase over and above the trust fund as quickly as the President's lip reading passes into memory.

I would like to add one quick point, and that is that we are not by any means exhausting the potential of the gas tax in America. APTA did a survey a couple of years ago of the gas tax being paid on an average in the other industrial countries in the world and found that the average, when normalized to $1 and a gallon was $1.82 cents per gallon of gas tax in the other industrialized countries. That is $1.82 average, with many of the more aggressive industrialized countries well above that. In America it is $0.22. In other words, the other industrialized countries are charging seven times the American gas tax for their gas taxes.

The result, of course, is that when you go to West Germany you ride on beautiful roads, modern mass transportation—and they are exporting the next generation of mass transportation to the rest of the world, and it is because they are paying for it. We are not. As a result, we are falling further and further behind in our ability to not only compete with new surface transportation technology because there is no effective governmental subsidy, but also we are choking on our exhaust because we are using excessively the single-passenger vehicle and we are creating a serious deficit balance of trade because of the importation of foreign oil to fuel that single-passenger vehicle.

We have treated this issue in great depth in the Transit 2000 package which you have received under separate cover and you and I have discussed in detail. We have no choice but to come to you and indicate that certainly we are strongly in favor of your policy of spending down the trust fund as quickly as possible, but we are under no illusions as to the ability of the trust fund to handle the needs of the nation's badly dilapidated and incomplete mass transportation system for more than a few years.

Mr. MINETA. This whole issue of commitment to transit is something that, of course, I strongly believe in, including support for operating assistance to cities of all sizes. I feel that this must continue. However, your association has also said, Mr. Chairman, that it might consider ways to limit the Federal Government's exposure to local transit operating costs. I wonder if you could expand on that and cite some specific examples?

Mr. SCANNELL. We have a problem. I am not entirely clear as to your question. Would you mind restating it, please?

Mr. MINETA. Well, in terms of your association's position, you have been—it advocates, from what I understand, limiting the Federal Government's exposure to local transit operating costs. So I am just wondering what that is referenced to. Is there an example that you might cite on this?

Mr. SCANNELL. Well, I might ask Jack to respond to that.

Mr. GILSTRAP. Mr. Chairman, I am not actually sure just what reference.

Mr. MINETA. Let me go to page 20 of the submitted testimony and read the portion dealing with operating assistance.

The transit reinvestment element includes the continuation of Federal support for transit operations for systems and communities of all sizes. There are a variety of strategies that might be considered to reexamine the eligible elements of operating cost and/or limit the Federal exposure or responsibility for operating costs. Nonetheless, some form of Federal operation support will remain a critical component of a Federal program for all transit systems, be they large or small.

Again, looking at that portion of it, I am wondering if you have any examples of how the Federal Government's exposure to local transit operating costs might be enumerated?

Mr. GILSTRAP. Thank you, Mr. Chairman. We have a very active study group taking this issue on at this moment and we anticipate that we will have some ideas for you in a very few weeks.

I think one of the directions that our group is going in is to look hard at the idea of maintenance of the capital investment. We have seen that work effectively on the highway side. Certainly there has been a sizeable investment of the Federal Government, not to mention State and local, in the capital infrastructure of the mass transit industry, and we must maintain that. We should not follow a practice of deferred maintenance. We have seen the effect of that in many of our cities.

I think one of the approaches here is to look at the portion of the operating assistance program which is now going to maintenance and preservation of that capital program and begin to look at the operating assistance from the angle that much of it—and it varies by size of city—is, in fact, not operating assistance, per se, but rather maintenance of the capital investment. I believe that is one of the very active reviews we have underway. We expect to give you more thoughts on that very soon.

Mr. MINETA. Many observers of transportation services and Federal transportation assistance programs have expressed concerns regarding the ability of these services and programs to adequately address the large increases and highly-scattered trips occurring in this country's suburban areas. Can you give us some specific examples of how APTA's members expect to convert more of these scattered single-occupant suburban trips to transit trips, as well as ways that Federal programs could better help in this conversion?

Mr. SCANNELL. Mr. Chairman, I would like to refer this to Richard Davis from Kansas City, Missouri.

Mr. MINETA. Mr. Davis?

Mr. DAVIS. Mr. Chairman, I think that the transit industry, in general, feels that for the last ten years—I think that we feel suburban service is probably the area that has been hurt the most by

the cuts in Federal funding for the last ten years; nevertheless, many transit properties have made improvements in suburban service by, in some cases, expanding bus service to the more rapidly-developing suburban areas. Several transit properties, including the one in Kansas City, have introduced a new small bus service using existing operators and using private operators to do a better job of providing that lower-density service.

We have also worked with private firms in the provision of shared-ride services to suburban employment centers. I don't think any transit property feels it has done a good job of providing for the suburban growth of the last ten years. Suburbia has been where most of the growth has been. We have been faced with declining revenues and we have responded, in a general manner, less than adequately. It is where we need to improve our response, and I think it would be one of the places that we would direct any new resources that became available to the transit industry.

Mr. MINETA. Thank you very much.

Mr. Shuster.

Mr. SHUSTER. Thank you very much.

We certainly appreciate your testimony today.

One of the things you recommend is that land-use decisions be made on the Federal level. Isn't that an encroachment of traditional authority of local governments in planning and zoning and development decisions?

Mr. SCANNELL. Well, Congressman Shuster, I think it is a question of opening up large areas where the Federal Government has a control or concern. I don't think we ever intended that we would preempt the right of the local States and cities to handle their own planning, clearly for which they are best suited. I know that when I wear my other hat, which is a member of the City Planning Commission of the City of New York, we do try to give zoning variances and permissions as to the heights of buildings, etc., to other parts of the city that we wish to have developed. That is sort of an example of how zoning can be used in conjunction with transit.

In addition, of course, we also provide that the developer should take account and be responsible for some financial arrangements where you are going to build larger buildings and overload the existing facilities.

Mr. SHUSTER. Of course.

Mr. SCANNELL. They take some responsibility.

Mr. SHUSTER. I think it is very find and proper for you to be doing that at a local planning level, but I get nervous when I read that Federal transportation policies and programs should require closer integration of transportation investments and land-use decisions. But apparently you are sensitive to that, so I hope you haven't over spoken yourself nor have I read too much into what you said.

I have one other question. The Administration has proposed that the discretionary grant program of a little over $1 billion provide the funding for, among other things, air quality and accessibility for the disabled. Do you believe that is where this funding should come from? Will this funding be sufficient for the transit properties to meet those Federal mandates on clean air and access for the disabled?

Mr. SCANNELL. If I may, Mr. Congressman, I would like to refer that question to Dennis Louwerse from Reading Pennsylvania.

Mr. LOUWERSE. Okay. First I will deal with the issue of accessability to the disabled. I will begin by saying that deteriorating infrastructure or lack of mobility, as you well know, is not just an urban problem. It is a rural problem and a problem of small-town America. That is why we strongly support increased funding under the section nine formula program and also the section 18 program for rural programs that those funds can be used to help provide needed services to the frail elderly, to the handicapped, and, quite honestly, to people in the rural and small-town America who have severe mobility problems.

I think in one regard that the small operators can teach a lesson to the big operators in response to Mr. Mineta's question, for example. Small-town transit systems use vans, station wagons, buses—a variety of vehicles—in order to respond to a real diversity of needs and an opportunity to provide this vital transportation. If you provide increased formula funding under section 18, those funds would help us provide that type of service and accessibility.

Mr. SHUSTER. But, of course, that is not what the Administration is proposing. My question is: based on what they propose, using the discretionary funds for both clean air and access for the disabled, will those funds be adequate for you to do your job?

Mr. LOUWERSE. No. Absolutely not.

Mr. SHUSTER. Thank you very much.

Mr. MINETA. Mr. Borski?

Mr. BORSKI. Yes. Thank you, Mr. Chairman.

Mr. Diridon, can I follow up on an earlier point of discussion you had with the chairman about how much money other industrialized nations—how high the gas tax is? Did you say it was seven times as much as what we pay?

Mr. DIRIDON. The survey indicated that the average for the other industrialized countries was $1.82 in taxes on a gallon of gas. This was normalized to a dollar and a gallon as the volume and value. Our average across the nation, including the States' taxes, is $0.22.

Mr. BORSKI. I guess that is my follow-up question. Do you know how that is divided? Is it all by the national government?

Mr. DIRIDON. I think it varies by country, certainly, but the majority—certainly in my experience with France and West Germany, which are two very strong examples of good transportation systems, it goes directly to the Federal Government and is administered by the Federal Government.

Mr. BORSKI. And is it dedicated completely to transportation?

Mr. DIRIDON. No, I don't believe it is. Although our policy is to request that you do dedicate it to transportation and we don't want to step away from that policy—neither are we asking you for $1.82, by the way. We are only asking for $0.07.

Mr. BORSKI. And the $0.07 that you are asking for is for public transit?

Mr. DIRIDON. That is accurate, sir.

Mr. BORSKI. And to increase the gasoline tax by $0.07 and give that all to public transit? Do you think that is practical and possible?

Mr. DIRIDON. That is the policy of the American Public Transit Association and that is what we would like to see. Obviously, we are not going to get back to the $6.5 million, which would be our 1980 levels—which were inadequate—and then add something to recoup for ten years of gross neglect, and then something to complete our incomplete systems—especially in the sun belt areas, which are now experiencing dramatic growth—with no ability to complete our systems. We are not going to do that with spending down trust funds.

Mr. BORSKI. I would tend to agree with you and be in favor of increasing the transit part. I just don't think it is practical that it will happen to ask for $0.07 completely dedicated to public transportation.

Mr. SCANNELL. We try to analyze what is needed in order to accomplish the goals, and the gasoline tax did seem to be a ready means of solution and we did not believe the $0.07 was an inordinate amount. Now, it is true that one other time we did get that flow of funds. It was on the basis of a $0.01 tax. But it is really a shifting of the means whereby the money would be secured to go for the $0.07.

Mr. BORSKI. Do you think it is practical, as the Secretary of Transportation is suggesting in his new policy, for the States to do this job by themselves?

Mr. SCANNELL. Well, that question has been asked a number of times and there have been a number of answers. One answer was that many of the States across the country have been paying or the citizens in the States have been paying for the use of the Federal funds for development in other parts of the country. And then when you come to the time when their area is in need of transit support, you should then cut that source of supply off from them and not have them have their opportunity to participate.

Mr. BORSKI. Thank you, sir. I couldn't agree with you more.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Packard.

Mr. PACKARD. Than you, Mr. Chairman.

While I am at it, I would like to ask unanimous consent from the chairman to enter a short statement that I have for the record.

Mr. MINETA. Without objection, so ordered.

[Mr. Packard's prepared statement follows:]

Statement of

THE HONORABLE RONALD C. PACKARD

Representing the 43rd District of California

before the Subcommittee on

SURFACE TRANSPORTATION

MARCH 20, 1990

MR. CHAIRMAN. I AM INDEED PLEASED TO PARTICIPATE IN THE CONTINUATION OF OUR MOST IMPORTANT HIGHWAY REAUTHORIZATION HEARINGS AND AM ANXIOUS TO HEAR TESTIMONY FROM TODAY'S WITNESSES. MASS TRANSIT IS MOST CERTAINLY AN AVENUE THAT WE ON THIS COMMITTEE MUST EXPLORE FULLY AS WE PIECE TOGETHER A HIGHWAY BILL THAT WILL MEET OUR CURRENT AND FUTURE TRANSPORTATION NEEDS.

MASS TRANSIT CAN BE AN INTEGRAL COMPONENT IN OUR QUEST TO ALLEVIATE CONGESTION AND PROVIDE ADEQUATE AND SAFE TRANSPORTATION IN THE FUTURE. MASS TRANSIT SYSTEMS ACROSS THIS NATION MOVE MILLIONS OF COMMUTERS EACH YEAR. WHILE SOME TRANSIT SYSTEMS HAVE BEEN VERY SUCCESSFUL, WE ON THIS COMMITTEE MUST BE AWARE OF THE SYSTEMS THAT HAVE NOT BEEN SUCCESSFUL IN HOPES OF NOT MAKING THE SAME MISTAKES IN THE FUTURE.

OUR TRANSPORTATION NEEDS MUST BE MET WITH A MULTI-MODAL

APPROACH. IN THIS APPROACH, HOWEVER, WE MUST KEEP IN MIND THAT CERTAIN MODES OF TRANSPORTATION ARE MORE EXPENSIVE THAN OTHERS POSSIBLY TO THE EXTENT OF BEING COST PROHIBITIVE. IT IS IMPORTANT THAT WE ON THIS COMMITTEE CONSIDER ALL MODES OF TRANSPORTATION TO MEET OUR TRANSPORTATION NEEDS AS WELL AS THEIR RELATIVE COST-BENEFIT.

I LOOK FORWARD TO HEARING THE TESTIMONY OF TODAY'S WITNESSES. THANK YOU MR. CHAIRMAN.

Mr. PACKARD. I want to remain on what the chairman and Mr. Borski just addressed, and that is the gasoline tax. I may direct it first to Mr. Diridon.

You are from California. I am from California. The chairman is from California. We are all aware that they are proposing a rather hefty gasoline tax for the State of California for transportation purposes. If we imposed a major gas tax at the Federal level is it not possible that we would eliminate that taxing base or that opportunity for the States to go to the people for revenues for transportation purposes by virtue of imposing a State gasoline tax?

Mr. DIRIDON. Mr. Packard, thank you for the question. I bring greetings, by the way, from Ann Kulchin, your very fine Transit Board Chair from your area. She asked me specifically to tell you hello for her.

Mr. PACKARD. Thank you very much.

Mr. DIRIDON. My understanding is that you are beginning your deliberations now on reauthorization, that debate to continue through the year receiving testimony, and taking action some time next year. That would certainly give California and any other State that would choose to solve part of the problem locally the opportunity of doing so before you entered into final debate on a revenue increase at the Federal level.

If the States across the nation were in mass to all of the sudden see the light and adopt substantial revenue increases at the State level, then it may be that APTA's position would change on this matter. But that hasn't been the case in the past. With rare exception—Washington State being one of those rare exceptions—the States have not addressed this issue effectively. We certainly hope that will change in June in California. I am fighting for that and you are fighting for that. We hope to be successful.

If it were not, though, this matter would become even more urgent at the Federal level.

Mr. PACKARD. My general position has been that it is better to impose a tax locally than it is to do it nationally. But, in fact, San Diego County—and, in fact, Ann Kulchin's North County Transit District, itself—is proposing a rather significant mass transit system by virtue of light rail 100 percent funded at local levels, none of it funded at the Federal level. San Diego has done relatively well with their transit system, with much of it funded—about 70 percent of it funded at local level with only about 30 percent matching at the Federal level.

Of course, part of the reason is that with congestion in California and with the need and the monies not coming forward, I think the people finally reached the point where they were willing to impose upon themselves an additional tax—one-half cent sales tax in the case of five of the six Southern California counties, and Orange County is the only one that hasn't and they will probably be passing a sales tax later this year—to fund transit needs.

When it reaches a point that the local needs exceed the ability to pay, is it fair then to impose a 75 percent Federal matching for other parts of the country when there are other places that are willing to go up to 70 percent of their own local monies with only 30 percent funding at the Federal level?

Mr. DIRIDON. Mr. Packard, I am very sensitive to what you are saying because I represent the Bay Area and the northern part of the State. The seven largest counties have all adopted the extra half cent. In fact, in some cases it has been a fully penny. We are doing all we can possibly do.

As you know, it is not fair to ask us to go up further because we would then be above sales taxes any other place in the nation and——

Mr. PACKARD. Well, we would be subsidizing other parts of the country.

Mr. DIRIDON. Certainly. And we are already doing that because we are a donor State——

Mr. PACKARD. That's right.

Mr. DIRIDON [continuing]. In terms of the gas tax. So we can't do it all locally. We can do a great portion of it locally, but we do need it. Funding for mass transportation is like a three-legged stool. You need the local, State, and Federal legs. If one of those legs is gone, then it does not matter how strong the other two legs are. The stool won't stand up. Right now the local leg in California is very strong. In fact, across the nation local agencies are stepping up to the responsibility and giving you a good, strong local leg. The State legs are being strengthened by actions like pending now in California. The Federal leg is almost missing. It is barely hanging on, and if it continues the way it has been over the last ten years we can safely say that there is no Federal leg. As a consequence, we are asking you to buy in as a full partner and become that strong third leg that we have relied on in past decades.

Mr. PACKARD. I totally agree with those comments. I question, however, whether 70 percent or 75 percent recommendation in terms of Federal match is the way to go. It appears to me that if you want a strong third leg, the Federals, and you already have or are getting the other two legs strong, that the balance ought to be then a lot different than 75/25.

Mr. DIRIDON. Mr. Packard, I agree. APTA has not contested the Secretary's statement that he is not going to offer more than 50 percent match. We are all scrambling now to try to find that local 50 percent—local and State 50 percent.

Mr. PACKARD. Thank you very much.

Mr. MINETA. Mr. Laughlin?

Mr. LAUGHLIN. I have no questions, Mr. Chairman. Thank you.

Mr. MINETA. Mr. Bosco.

Mr. BOSCO. Thank you, Mr. Chairman. I appreciate seeing Mr. Diridon here. I am sorry I missed your testimony. I had to testify, myself, at a different hearing.

You represent an area of California that is under focus in part of the State that I represent only because we want to try to prevent the type of traffic congestion that is endemic in the San Jose/San Francisco area.

But I notice that almost all the environmental groups support mass transit—particularly up our way they want railroads or high-speed rail or something like this—and they don't support any highway expansion to speak of. Almost none of the environmental groups will sign off on any expansion whatsoever, even one more lane on the freeway. Yet, it seems to me that there is a dichotomy

that mass transit seems to require far more growth and urbanization than do the highways. Can you speak to that?

Mr. DIRIDON. I do understand, Mr. Bosco, very clearly. It is an issue that we are fighting every day in the Bay Area through the Metropolitan Transportation Commission and the Bay Area Air Quality Management District, which is now under suit by the Sierra Club, as you know, and the Sierra Club has won that suit very clearly and we are now being ordered to consider reducing our highway expansion.

I think the reason why—and I would have to guess, because I don't represent the environmental organizations. I think the reason they stress mass transportation—and the reason why we do, also, in terms of a land use device—is because it focuses growth. Even though you may have a rail line that goes through a rural area, if you don't have stops it doesn't create growth in that rural area. It does encourage growth, though, around the stations. As a consequence, rail transit can be used as a growth-control device by guiding growth around the stations and encouraging density around those stations with the cooperation of the local planning authorities.

That is a policy that has been adopted now as something to be encouraged by all three of the Bay Area's regional agencies and by many of the local governments.

Mr. BOSCO. Is there any evidence of that, though? I would think that you could say that a highway wouldn't cause densities if you didn't have an off ramp somewhere. But what actually happens in both rail and highways is that people will be able to settle in the outlying regions and drive to the railroad station or benefit from the highway.

It seems to me that each route encourages growth. I guess I am just asking why the environmental community is so stuck on mass transit when just for the cost of it, alone, it requires enormous growth in an area to sustain it.

Mr. SCANNELL. I would say that I think the environmentalists recognize that things just grow and they grow and they grow and the roads are not adequate to handle the traffic back and forth—so much so that the trip from work to home and back and forth can add maybe 20 to 25 minutes, depending on the area of the country, and it also adds to the pollution in the air with the tie-up on the highways. Of course, there can be isolated situations where the roads flow freely.

But the way the country is growing and the way it is grouping it is quite apparent that if we are going to protect the atmosphere we do need to do something about the automobile with 1.1 average occupants. I think that is why we have allies in the form of the environmentalist. And I think that is one of the reasons why transit should be part of the national policy, because the Bush Administration has announced that one of their primary goals is to improve the quality of air in the nation. Clearly, one of the shortcuts to achieve that is to reduce the pollution from the gasoline engine or the diesel engine, as the case may be.

Mr. BOSCO. Well, I understand those overriding questions. I was just speaking more to the question of what causes more growth—highways or mass transit?

Mr. SCANNELL. My experience has been, in travelling to Europe and places, especially in Sweden, that when they open up a new area the first thing they set out in their planning is a public transportation facility in order to provide the transportation for, as they call it, the "new town." It is one form of foresighted planning. I think that it has some good points to recommend it.

Mr. BOSCO. Thank you.

Mr. Diridon, it is very nice to have you here, too. You have done some very fine work for our State. Thank you for that.

Mr. MINETA. Mr. Hancock?

Mr. HANCOCK. I have no questions, Mr. Chairman.

Mr. MINETA. Mr. Laughlin?

Mr. LAUGHLIN. I have no questions.

Mr. MINETA. If I might, let me go over some additional questions that I have.

We have heard both from highway and transit groups that greater flexibility is needed in the delivery of Federal assistance for highway and transit projects. As I have always maintained, flexibility is in the eye of the beholder. If you are the director of public works for a community, that is one factor. If you are the State transit or transportation chief, your idea of flexibility is another. If you are the operating chief of a local transit district, flexibility is another.

How does APTA define flexibility in the context of transit programs?

Mr. SCANNELL. As I remember, when you addressed us, Mr. Chairman, you said the term "flexibility" is really another term for saying "we are not going to give you any money." [Laughter.]

But, narrowing the focus to the question as presented, Mr. Davis?

Mr. DAVIS. Mr. Chairman, I think our position is that we think we need to preserve the basic capability that the public transit receives.

I represent the Kansas City area and, quite frankly, if our metropolitan area had the chance to use all of our money any way we could I'm afraid we would build more highways and have less transit. So I think, generally speaking, we recognize that we are the smaller component in any discussion regarding sharing highway and transit money, and we'd like to make sure that the base amount that we have available is preserved.

Our program recommends that we reestablish the basic funding at $6.5 billion per year, and we would like to see that preserved for transit. We would like to see any additional funds that were made available for transit in a flexible pot that could be used for transit or highways. We would also like to make sure, if that occurred, that there were additional highway dollars there, too.

Earlier a question was raised about seven full cents for transit. It should be clear that APTA does not oppose additional gas tax increase for highways. In fact, we would probably support it if the highway leaders took that position. We have not taken a position. We do not think that is the position we should be taking.

But I think that what we have been saying is that we need to build a stronger transportation system, and that includes both highways and public transit. We say that if additional dollars are made available for transit, a substantial portion of that addition

should be flexible money. And if, in fact, transit has to give some of that additional money up for a reserved lane, we would be delighted to consider that opportunity.

Mr. MINETA. You have testified that the concept and definition of transit must be expanded to include all forms of high occupancy shared ride services. I would like to ask: what is it that your association is hoping to gain by taking this approach? It seems to me that the potential exists for shared ride highway improvements, diverting funds from badly-needed improvements to existing bus or rail transit facilities.

Mr. SCANNELL. I would ask Mr. Louwerse to respond to that.

Mr. LOUWERSE. I think our position is that some of the traditional things we have done need to be changed. We hope this is a bold approach.

We need to realize our basic goal, which is to move our society in the most economical, best-for-the-environment, and hopefully best mobility opportunities possible. That can be done, in our judgment, by a variety of types of service, some of which are very highly unusual in our current concept of public transit. It is more than a bus running down the street or more than a rail.

For example, in the rural area we do what is called "deviated fixed routes," where you are actually trying to meet the needs of the community in which you serve.

If we broaden our approach we must look at transportation as a whole rather than as a vacuum—transit over here, taxis over here, shared ride and rail over here, even highways. We have to put that whole picture together. By having that broad—that is a give up for some of us. We all have our own little world. But we all are willing to have a new approach and new methodologies. We feel that we can better to transportation at a cheaper cost and also for the betterment of our environment and our community. That is the approach. It is a broad-brush approach rather than a very narrow, individual, pigeon-hole approach.

Mr. MINETA. And if flexibility is built into the program with some of the safeguards that Mr. Davis is talking about you don't feel that it will be tiled towards high-occupancy lanes on roads and take away from your transit operations?

Mr. LOUWERSE. Let's say that there are honestly some fears. Change brings fear to everyone. But we feel that if we fund the basics of the program and we look at the expansion type things and the growth and those things that are needed to enhance mobility in our community, we can work with the highway people and other transportation interests. At the local level we should best be able to determine how those needs are best met. In some cases it will be a high-occupancy vehicle lane. In some places it will be a rail system. In some places it may be vans. We are willing to take that chance.

Mr. MINETA. Let me ask the panel: flxibility requires a strong MPO—a regional planning organization of some nature. Do we have that in place across the country to really be able to afford flexibility?

Mr. DAVIS. We certainly have it in Kansas City. We are a bi-State metropolitan area. The Mid-America Regional Council is, I think, a superb metropolitan planning organization. It doing its job

very well, working with suburban and urban local governments and the two State highway departments and the transit authority. It works well.

Mr. MINETA. And once the MPO has spoken on an issue the local transit operating agencies don't go off on their own, thumbing their nose at the MPO and saying, "Well, I sure as heck don't like what they said. I'm going to do something else on my own."

I will cite you some examples.

Mr. DAVIS. We are a participant in the process and we are pleased with the voting opportunity we have at the MPO level.

Mr. DIRIDON. Mr. Chairman, I would like to add my comments on that.

If you give authority to an MPO, even areas that don't have strong ones would have to create strong ones in order to exercise the authority. For example, if it became policy that Federal assistance would not be given to a local area without the MPO's approval, then the MPO would have a tendency then to become more powerful.

Right now the MPOs that have become effective have done so typically because they have received State authority or because they have welded coalitions within a region that have made them effective. The missing ingredient is real authority delegated from the Federal Government to the MPO level, which is what APTA is requesting.

Mr. SCANNELL. I would say, Mr. Chairman, generally speaking there is, across the country, a good overall control. Obviously there are going to be aberrations and time and circumstance are probably going to correct those. But in the main I would say that each locality or each State functions reasonably well in defining controls and exercising controls.

Mr. MINETA. Now, with regard to rural transit activities, does APTA have any specific recommendations on how we can improve the section 18 program?

Mr. SCANNELL. Dennis, do you want to handle that?

Mr. LOUWERSE. Okay. I guess our first recommendation is that the resources currently available to provide rural public transportation are woefully inadequate. The growth in the number of rural transportation providers has been astronomical in just the past few years. For example, in Pennsylvania we now have public transit in every county in our State. We would say that we need greater resources and—I hate to use this word, but I guess I have to—flexibility. There is a lot of "social service transportation." You get into the problem of this person who has to go 60 miles to go to the doctor. Should that ride be paid for under some social service program? Is it a transportation need? The bottom line is that the person needs to get to the doctor and we ought to have an overall flexible approach with adequate funding so that that transportation need can be met. I think that is the key. Resources and flexibility I think are the two key words in rural transportation.

Mr. MINETA. And in your case in the Berks Area, is that a multicounty regional planning agency?

Mr. LOUWERSE. We are a small, urbanized area. We are 172,000 people. We think we are a good example of flexibility, if we could get it. We have a key urbanized area of 172,000, in which we

mainly used fixed-route buses to provide that service. We have a much broader area in terms of distance—in some cases it is 50 miles in one direction—where we use van service. Some of our van——

Mr. MINETA. Is that still within the Berks County area?

Mr. LOUWERSE. That is still within Berks County. It is all in the same county. We go 50 miles in one direction to get the person to bring them to the small urban center where the hospital is. We use van service.

Also in that van service is the general public, not just persons who are elderly or who have handicaps. This is the type of flexibility that rural and small urban systems need—a variety of types of services, a way to look at your situation from a local point of view. But, again, our State funding has increased dramatically. But, unfortunately, at the same time, our Federal funds have decreased by 50 percent. So, in reality, we haven't even been able to keep pace.

I think you'll also find that in the rural areas the people are demanding, because they have felt they haven't gotten their fair share of public transportation. The economically disadvantaged people want to get to town to have a job and they are saying, "Where has our public transportation been?" We really need an influx of public dollars to public transportation in the rural areas.

I think that the rural legislators will support and know the need for public transportation as long as they know it is finally going to come home and their people in rural areas are finally going to have an opportunity to use public transit. I think that is the most important thing.

Mr. MINETA. Mr. Smith, you are not an operating district, you are not big or small; you are an associate member of the Board of Governors. As I understand it, you are representing manufacturers and suppliers to the transit industry.

With all this talk about Federal transit policy, what are the implications of all of this on suppliers and manufacturers to the transit industry?

Mr. SMITH. I thank the Chair for the question. Let me, before directly answering it, point out to the committee that the supplier industry is more than just those who build buses and rail cars, of course. As you know, it extends to the architects, the engineers, the other consultants, the land use planners, and so forth. So it is not just entirely a manufacturing process; it also includes services.

Our future in the transit industry is inextricably tied to the future of the funding for our operating systems. If our colleagues on the operating side of the house receive the funding levels that they need to operate, maintain, and improve the services on their systems, then we, too, because they are our customers, shall succeed.

I might add, Mr. Chairman, that the associate members of APTA are highly participative in the process—the testimony that you heard today, the answers to your questions. We take active part in the committees, and through the committee structure we provide the input.

So while we, on the one hand, are viewed as private industry and they are viewed as public entities, it is not a "we and them" situation. We are in this together. We cannot survive without them at

the proper funding levels, nor can they survive without the equipment and services that we provide to them.

Mr. MINETA. Mr. Laughlin.

Mr. LAUGHLIN. Pardon me if I mispronounce your name, Mr. Louwerse.

Mr. LOUWERSE. Louwerse.

Mr. LAUGHLIN. Thank you. I come from a large rural district, and you said something that pricked my ears. You said you expected rural legislators to support mass transit when they saw that that transit is going to go to rural areas. I am really curious how you are going to do that.

Mr. LOUWERSE. I should point out first that we need to once again get past our attitude of mass transit in the traditional sense. For example, in our State we have a major shared ride program. In my system we have 20 vans that go out to all the various parts of our county, into the rural and less-populated areas, because those people also have needs, whether it is to go to work, whether it is to go to the doctor, or, in some cases, to go to congregate meal sites.

One of the problems is the isolation of the rural areas. We have made a special effort in our areas and in other areas of the country to provide this nontraditional public transportation. I am sure there are individuals in your district who have needs to go for medical care, who have needs to go for other—even to go to talk to somebody maybe. We need to broaden our definition of public transit.

Those services can be provided. In my area they are being provided. We provide 1,400 rides a day. We have a total county-wide population of about 200,000. Many are off 40 miles in some direction and 40 miles home. But those people need those services.

If your people would get those services—and they probably are clamoring. If you would talk to your social service agencies they are probably saying they have programs but can't get the people to go to the programs because there is no way to go.

Mr. LAUGHLIN. You are right. There are people that need those services. And you are also right that somehow you have to change the attitude. That is what I was trying to figure out. How do you change the attitude and how do you provide the service?

When you talk about a population of 200,000, I do not represent any county that has got that kind of population, nor any area that has got that kind of concentration within this district.

Mr. LOUWERSE. I can give you another example. In Northern Pennsylvania there is a five-county region where the population density per mile is astronomically low, where people have to go 100 miles to get to a hospital. They have put together a variety of services.

For example, the driver takes the vehicle home at night because if you have to go to a garage you have to travel 60 miles and then go in the other direction.

Those people still need to get to a medical center or some other type of service, and I would submit to you that the need is there, the ability is there. All people have to do is learn about it. It can be done. It has been done other places, and I am sure it can be done in your district. There are probably many people who would like to

have that job done. It is not a traditional bus running down the highway, but it can be done.

Mr. LAUGHLIN. I understand now what you are talking about. Earlier I thought you were talking about in the traditional transit systems. I didn't know how that was going to work. Thank you very much.

Mr. LOUWERSE. Thank you.

Mr. LAUGHLIN. Thank you, Mr. Chairman.

Mr. MINETA. Let me ask a final question of the panel. The Secretary has proposed a transit investment overmatch policy which some have indicated would skew Federal transit investment to wealthier communities to the exclusion of localities who have fewer financial resources. I am wondering here if APTA supports an overmatch policy. If so, how do you structure the policy so that it doesn't discriminate against poorer communities?

Mr. SCANNELL. Mr. Davis.

Mr. DAVIS. Mr. Chairman, the last time our Legislative Committee addressed that issue we did oppose it for that very reason. We felt that what that would do would be to concentrate programs in the wealthier transit properties to the detriment of the poorer ones. But we are concerned that the existing match programs be retained.

Mr. MINETA. So it is a straight opposition to the program, I take it?

Mr. DAVIS. I think our industry is somewhat divided on that, but our most recent position was one that supported the previous position and opposed the change.

Mr. MINETA. Is there some kind of a factor that might be included on the ability to pay?

Mr. SCANNELL. Perhaps Jack Gilstrap would comment on that?

Mr. GILSTRAP. I was going to comment on the previous question about that—when you really get down to it, Mr. Chairman, to say that we are only going to spend and send our discretionary funds to those areas that can outbid the other areas based on their riches denies the whole thrust of that discretionary program, which is to meet needs with those Federal dollars as opposed to putting them out for bid. I don't think we like that idea.

Now, we are certainly anxious to pursue other ideas which may help deal with the problem. Your second question as to what we might consider as some kind of a factor based on ability to pay, the best that we have come up with so far is a fixed matching program, to be very honest with you.

I would like to, if I may, add one more thought on this discretionary program, and it goes back to a question asked by Congressman Shuster about the land use planning issue. I may be the only one here at the table who feels this way, and I probably ought not say it, from the looks of the chairman here, but I personally believe——

Mr. SCANNELL. All I said is that fools rush in where angels fear to tread. Go right ahead, Jack.

Mr. GILSTRAP. Well, I don't operate a transit system, so maybe I can say this—although I did at one time and I wish I had had this Federal—you know, you can do a lot with incentives. I would agree

there is no way that the Federal Government should dictate land use planning to the local community.

But, on the other hand, when you look at what they do north of the border where the province says to the local community, "If you want us to participate in the funding of a project, then show us a land use program that will develop density around that facility that we are investing in and maximize its use and maximize its benefit to the community." And they do that there. The community will say, "All right. We will channel some development around that facility that will maximize its use and benefit."

I think that is another part of the total consideration of what the Federal projects ought to be based on—a clear match, a set match, and some kind of inducement and incentive to have that facility be part of the community's local planning so that it will actually be used and maximized.

Mr. MINETA. That sort of brings up an interesting point. All this talk about land use planning may be a very moot issue because it is not going to be transportation that is going to be impacting on local decisions any more. I think it is going to be clean air. We might as well all pack up our bags, frankly. We used to always—wearing my mayor's hat — I used to be fearful about Federal land use planning from a national perspective. I think it was thought of as a transportation issue. But I think that is yesterday's game. Today it is clean air. We are going to lose it.

In fact, if I look at that Clean Air Act that is coming through the House right now, I think it really is a very big thing. We see it already with the South Coast Air Quality Control District down in Southern California.

When I think about what is going on there, you have a local air pollution control district that says, "In 1997 we are not going to have any more diesel trucks in our area." And yet, if I were to call Cummings or Detroit Diesel or Caterpillar and ask them what they are doing on alternative energy engines for our trucks they will say, "We are not doing too much. We are working on cleaning up the diesel, but we are not doing that much on alternative fuels engines."

To me this transportation/land use planning kind of thing we used to always go through of whether we need seven dwelling units to the acre or thirty-five or whatever to make transit viable is going out the window because now it is going to be the Clean Air Act that is going to be determining all this.

Mr. SCANNELL. May I ask a question?

Mr. MINETA. Absolutely.

Mr. SCANNELL. Of course, the Federal Government attempts to do it by setting standards. The standards may indirectly affect the planning. Do you think the Federal Government should go beyond that?

Mr. MINETA. Well, standards setting is the very thing that makes it dangerous, I think. If I were to get away from the Clean Air Act and talk about clean water, our technical ability to analyze is outstripping our ability to regulate in the sense that we used to have machines that detected in the water one part per million. Now we have got machines that detect one part per billion. It is going to be one part per trillion.

But the problem is that becomes the standard. It doesn't make any sense. I see that happening now in terms of clean air. Our ability to analyze then becomes regulatory, but that then makes it impossible at the local level to do certain things.

I see this thing escalating. I am not sure, as we are trying to be competitive in an international, global marketplace—I see ourselves at a disadvantage in terms of the kinds of imposition on some of these burdens that are being placed on local and State governments.

I think I am one who is considered very—I like to consider myself sensitive about environmental issues, about human factors. But sometimes I think maybe we may start digressing a little too far off the track.

Mr. DIRIDON. Mr. Chairman, if I might comment on that?

Mr. MINETA. Mr. Diridon.

Mr. DIRIDON. I share your concern about the environment. I have enjoyed watching you and helping you on environmental issues through the years, so I know your statement is not intended to be in any way anti-environmental.

My sense is that your comment that the major driving forces will no longer be land use and transportation is a factual one. But I think in order to meet air pollution criteria, mass transportation is going to become more important in the future rather than less important. The difference will be that instead of meeting our mobility requirements by adding another lane to the freeway we are going to be really pressured now to meet future mobility requirements by adding a mass transportation capacity because we can, therefore, transport people cleanly and efficiently, even to population centers that may be some distance away from an employment opportunity.

That seems to me to be the salvation of our competitiveness with the rest of the world. We can then move people more quickly and in a more humane way using less fuel, creating less pollution, and reducing our deficit balance of trade, and causing, therefore, a more competitive America in the future rather than a less competitive.

Mr. MINETA. Thank you.

We have a vote here. Let me just mention to all of you at APTA how much all of us do appreciate your work and your leadership. At this point let me just thank all of you.

We will recess at this point and come back and reconvene at 1:00.

Mr. SCANNELL. Mr. Chairman, thank you for your gracious hospitality and your time. You were very gracious, as were your colleagues.

Mr. MINETA. I know that in the next 18 months or so we are going to be seeing a lot of each other and working together because we do have a very vital piece of legislation which we have to have in place by the 30th of September, 1991, as you are so very well aware. And I look forward to working with you to that end.

Thank you very much.

Mr. SCANNELL. Thank you.

[The joint prepared statement of Daniel T. Scannell, Richard F. Davis, Rod Diridon, Irving P. Smith, Dennis D. Louwerse, and Hershel R. Payne for APTA appears on p. 1183.]

[Recess.]

Mr. MINETA. The subcommittee will please come to order.

I want to make sure that we have Mr. Molofsky and Mr. Luby here giving the testimony in time for the five o'clock news. [Laughter.]

Again, I really appreciate your being here for the presentation. Let me go ahead and indicate that the full statement will be made a part of the record. Mr. Molofsky, please go ahead and start off.

TESTIMONY OF ROBERT A. MOLOFSKY, LEGISLATIVE DIRECTOR, AMALGAMATED TRANSIT UNION, ACCOMPANIED BY ARTHUR M. LUBY, LEGISLATIVE DIRECTOR, TRANSPORTATION WORKERS UNION OF AMERICA

Mr. MOLOFSKY. Thank you, Mr. Chairman.

I will try to summarize the highlights of our statement.

It is a pleasure to appear before you, Mr. Chairman, your distinguished staff, and other members of the committee.

I serve as Legislative Director of the ATU, and I appear here today on behalf of our international president, Jim La Sala, who expresses his regrets at his inability to appear today.

We are here to reaffirm our commitment to a strong Federal mass transit program and to outline our policy recommendations for inclusion in a new Federal highway/transit reauthorization bill designed to transport us into the 21st century.

We represent, of course, 160,000 transit workers throughout the United States and Canada. We are here today with the full support of the AFL–CIO and its affiliated organizations in the rail, bus, and transit field. We certainly concur in the views to be expressed by Art Luby on behalf of the Transport Workers Union.

In support of our statement we have attached a series of resolutions recently adopted at our 49th convention held in California in September of 1989.

I would like to premise our more specific views by adding our support to the growing national consensus that a reinvigorated Federal transportation program funded in partnership with Federal, State, and local governments is essential to ensuring America's economic competitiveness in the 21st century, solving our congestion and energy conservation problems, improving our quality of life, and, of course, responding to our growing and changing mobility needs for all citizens.

I would like to specifically take this opportunity to acknowledge and support the committee's recent deliberations to report out the pending Americans with Disabilities Act, which will provide much-needed guarantees and improve transit access opportunities for our nation's disabled citizens.

As this committee has heard, we know we are coming off a decade of transportation neglect highlighted by an unfortunate decline in Federal support for mass transit assistance. Reductions exceeding 50 percent in Federal aid were allegedly justified since 1980 by a rising Federal deficit and a desire to substitute State and local support for the reduced Federal funds.

We have been particularly concerned as the Reagan and now Bush Administrations have sought to undermine the collective bar-

gaining and job rights and to take away employee protection guarantees to transit workers and to impose privatization on the transit industry through skewed competitive standards and threats of reduced funding. The impact of these failed policies has been to leave the transit industry and its workers in confrontation and our State and local communities financially burdened as they have been striving to meet their mobility needs.

Unfortunately, while the new national transportation policy released this month by Secretary Skinner recognizes the need to improve our mass transit network and infrastructure, it seeks to perpetuate the failed policies of the 1980s by opposing any increase in the level of Federal capital funding, by proposing steep reductions in Federal transit operating assistance subsidies, and by imposing competitive bid privatization of public transit services as a means of forcing labor cost reductions.

The increase of these adverse transit and transit labor policies has been to place again serious financial burdens on our State and local governments—in particular, the development and implementation of the Administration's privatization policies since 1984 have served to effectively dictate to cities the methods by which local public transit should be provided.

These policies, as implemented, require grant applicants to employ unbalanced competitive bidding standards to contract our an ever-increasing percentage of their public transit service to private operators as a condition for the receipt of otherwise diminished Federal funds. Such policies have clearly been counterproductive to effective mass transit operations.

This view has been recently supported by the results of a new study released in September, 1989, which I understand has been presented to the committee by the Economic Policy Institute, an independent Washington research center. This study, entitled The Emperor's New Clothes: Transit Privatization and Public Policy, was undertaken by a group of recognized transit experts based upon a year-long review of the Reagan and Bush privatization program.

They found that using Federal transit funds to compel communities to privatize their transit systems, while producing profits for private contractors, has caused the deterioration of urban transit services. Although the stated goals of these privatization policies is to reduce the public cost of providing transit services, they found no evidence that it has actually saved money either for the communities affected or for the Federal Government. In fact, they found it has probably increased the cost of mass transit by implementing a less efficient use of public resources.

Overall, the policy recommendations in the new national transportation report offer no new solutions and simply mirror program initiatives which did not work in the 1980s and for which there is no evidence to expect that they will work in the 1990s.

The nation's transit operational and infrastructure needs are too great to expect State and local governments to dig deeper while the Federal Government refuses to increase its own funding commitments.

Rather than confine our comments to a continued criticism of the Administration's initiatives, we would like to briefly outline

those major policy recommendations and provisions the ATU believes must be included in any new Federal national transportation program.

First, we reiterate our call for a strong, dynamic, and well-funded transit program in partnership with State and local governments established to reverse the radical and destructive policies implemented over the last eight years.

We call upon the Congress to design a new policy for the 1990s which emphasizes increased Federal financial support for our national mass transit program.

We share the industry's views, as expressed by APTA and others, that a minimum of $6 billion annually in Federal transit aid is required to enable communities to respond more effectively to their capital and operating needs.

Second, in designing legislation to carry out this enhanced Federal effort we believe this committee should continue to use a framework derived from the Surface Transportation and Uniform Relocation Assistance Act of 1987. In this regard, a renewed Federal mass transit program must contain an enlarged formula program with enhanced discretionary funding. Money for this effort must be derived from general revenues as well as from significant increases in the transit dedicated portion of the Federal motor fuels tax and available for both operating and capital assistance.

Indeed, maintenance of Federal operating assistance for all recipients is one of our top priorities.

As stated, we support proposals to increase the existing Federal highway user gasoline taxes earmarked for public transportation on condition that such revenue is used to supplement and not substitute for the general revenue funding portions of the Federal transportation program. Increases approaching $0.07 per gallon would provide the necessary revenue to maintain an effective public transit program.

Fourth, we recognize that in designing a new formula and discretionary program some consideration should be given to increasing the recipient's flexibility in the use of such funds.

Our view of such flexibility, incidentally, has more to do with the types of mass transit alternatives that the funding should be used for and the opportunity to use such funds at the recipient's option for both capital and/or operating expenses.

In all cases, however, such flexibility should not be allowed to detract from servicing our mass transit needs nor otherwise permit any avoidance of planning, environmental, labor protection, and other requirements now part of the program.

Fifth, we support revisions to the Federal tax code to eliminate the taxation of employer transit subsidies and other disincentives to transit use.

I would like to spend the remaining portion of our testimony amplifying our discussion of two principal issues which we believe require careful attention by the committee, and they are the Department's privatization policies and retention of the section 13(c) employee protection guarantees which, for over 25 years, have enabled transit labor to work with grant recipients as they have provided expanded services, adapted to technological change, and afforded a wide range of transit alternatives to our nation's citizens.

Preservation of this basic labor protection and affirming its original intent to guarantee the collective bargaining and job rights of workers in the industry to protect them by equitable arrangements from any unavoidable impacts arising from the grant program is an essential component of our support for new legislation.

We have repeatedly stated before this committee that decisions about private sector participation should be made—including decisions to employee competitive bidding and to contract out—at the State and local level, free from any Federally-imposed standards, guidelines, or policies, and that private sector involvement in public transportation remain a local option which should be examined only when such services can be complementary to the existing public transit network and only when there can be a partnership of public and private providers protective of employee interests.

Recent experiences in New Orleans and Miami, Florida, where portions of the city's transit services were contracted out have borne out that privatization is no panacea. In early February, the New Orleans Transit Authority voted to terminate its contract with Greyhound Lines, Inc., for the provision of five bus routes after only one year of its expected three-year operation because of sharply rising costs, ridership losses, revenue decreases, increased accidents, maintenance, and other service problems.

In our view, the policies of the 1964 Act in favor of a neutral position should be reaffirmed by this Congress. Only a vigorous restatement of this neutrality principle incorporated in a policy directive to the Department of Transportation will be adequate to restore community-based decision making on this issue.

In this regard, we note more specifically the current UMTA privatization guidelines with respect to the use of fully allocated costs by public transit agencies when comparing their services to the big costs of private operators biases the decision making and continues to produce erroneous cost comparisons, which, as in New Orleans, ends up costing the public more rather than producing real savings.

Finally, we would like to turn to an area of special concern to transit labor—and to ATU and TWU, in particular: the retention of the collective bargaining and job right guarantees contained under section 13(c) which, since 1964, have served as a key component and condition of the Federal transit program.

The history of the section 13(c) employee protection program demonstrates that transit labor, working in partnership with our nation's transit providers, can respond to our nation's changing transit needs in a manner which provides necessary protection to those workers, while servicing the riding public's demand for high-quality, safe, efficient, and responsive transit service. It is essential, in the ATU's view, that any new Federal legislation ensure the continuation of these labor protections and their application to the entire transit grant program.

As the debate unfolds on new specific legislative proposals, we are prepared to respond to specific issues and concerns in this area.

At this time we wish to note that over the last 15 months the ATU was involved in over 458 transit grant applications involving the processing of 13(c) protective arrangements. In over 86 percent of these, 397 of those cases were processed within one month of our

receipt of the grant applications. These projects involve both capital and operating assistance, special transit technology, privatization components, alternative fuel arrangements, entrepreneurial and suburban mobility initiatives. Indeed, their average processing time was only 13 days.

We emphasize this at this time because some of our critics have repeatedly asserted that transit labor has served to delay the distribution of Federal transit funds. This is not so. It has never been so. Clearly, this is a record. Our processing of 13(c) protective arrangements is a record of which we are proud. It demonstrates our commitment to achieving a fair measure of equitable protection for our members, while ensuring a timely distribution of much-needed grant assistance. In our view, the administration of the 13(c) program has worked well and should remain within the Department of Labor.

Recently we met with Department of Labor officials to discuss ways of improving their administration of the program, and we are prepared to carry on those discussions. We do not believe, however, that it is wise or necessary to modify in any way the current statutory framework which has allowed this program to respond to changing transportation needs while protecting the collective bargaining and job rights of the industry's employees.

Proposals to limit the scope of negotiations or the party's choice of response to privatization issues raised by specific grants are not needed nor justified. When Congress first initiated these protections it emphasized that the arrangements were to be the products of negotiations among the affected parties. Nothing in the history of the program justifies a change in this procedure or a narrowing of the grants to which they are applied.

In conclusion, we wish to emphasize our willingness to work with the committee as it seeks to reach a broad-based and bipartisan consensus on a new national mass transportation program. Transit labor works at the heart of our mass transit services. We take our responsibilities seriously.

We are pleased to work with the committee, this Congress, the Administration, and others throughout the country to improve our existing transit program and provide the best and safest form of public transportation for our country's citizens.

Thank you, again, for the opportunity to appear here on behalf of myself and President La Sala. We are prepared to answer any questions you may have.

As an aside to our discussion on the national transit program I wish to recognize the concern expressed by you and other members of the committee to the Department of Transportation regarding the safety issues raised by the current Greyhound strike and the need to be assured that the company is using well-qualified personnel who are properly trained. We continue to believe that that is an ongoing problem at this point in time.

Thank you. That concludes my statement.

Mr. MINETA. Thank you very much, Mr. Molofsky.

Let me go ahead and have Mr. Luby give his testimony and then we will open it up to questions.

Mr. LUBY. Thank you. It is good to see you, Mr. Chairman. You are, of course, held in the highest of esteem by our 40,000 airline

members, and we are delighted now that you are chairman of this committee where we have 60,000 members.

First, I have submitted my statement for the record. I would just like to amplify four points made in the statement.

Two weeks ago, when I was watching Secretary Skinner make his presentation before you on C-Span, it struck me that I could have predicted what was going to be in it. There was nothing that I or Robert or anyone else didn't predict. And the incantations in relation to mass transit about more privatization, less Federal assistance, and eliminations of labor protections were probably more preordained than the required reading at my Bar Mitzvah.

I honestly think that it is a subject of sufficient importance to the public that it really deserves a better and more creative treatment, and we hope that in this process that is what it will receive.

Now, the first point that I want to make clear is that we now have had several years' worth of experience with the Reagan Administration's and now the Bush Administration's forced privatization program. A lot of that is outlined in my discussion about Miami.

I would add that in Miami, former Administrator Stanley put seven profitable routes into the hands of the private sector. There was no additional service. There was no competition on the route. You had one major difference: the employees were less well paid. I would like somebody to explain to me exactly what we accomplished by doing this.

That has essentially been the story of privatization. There have been more complaints about the performance of the private operator along this route than the public operator. I think that the guiding assumption that somehow the public gains when you simply substitute a private monopoly for a public monopoly has got to be jettisoned by this committee.

I think, as a practical and an ideological matter, the privatization program of the Administration is a complete failure and makes no sense. I would hope that would be recognized in the reauthorization process.

Second, I would like to concur with Robert's remarks about the importance of 13(c). We hear a lot about the burdens of 13(c). We at TWU have been involved in 20 to 25 grants. I can remember one where we went to the Department of Labor and said, "Hold up this grant because we have a problem." The guy from the Department of Labor looked at me and said, "So you have a problem. So what?" And then the grant went through.

The one thing that 13(c) does do is that, as a matter of law, it forces the company to go ask you and to deal with you concerning the potential impact of Federal transit assistance. In my judgment that is a good thing because it gives the employee the opportunity for input and an opportunity to protect themselves and to make accommodations for whatever the impact is going to be.

I think the collective bargaining process which 13(c) protects is a very creative process. I doubt that the Houston Transit Authority would be in operation now if some of the innovations that we made in our collective bargaining agreement in Houston had not been adopted.

The second point I would make is that, again, I am distressed. Just like the spring prayers every year for the spring sowing, every year the Administration comes back with elimination of operating assistance. If you want increased transit productivity, the only way to do so is through a strong operating program because upon analysis you will find that the most recurring reasons for productivity failure are maintenance problems, and maintenance problems are operating problems.

Keeping rolling stock in repair, keeping adequate spare parts inventories—those are the keys to improving transit service. Putting private operators on well-serviced routes has nothing to do with productivity. It is repairing buses, having enough tools to do the work, and properly training your people. All of those are operational problems.

Finally, as was discussed by the panel this morning and as Robert addressed, transit is really going to be a key aspect of our efforts to deal with the growing environmental and pollution problems in our major cities. Without a major initiative mass transit we will simply have more pollution from automobiles and we will be forced to develop more Federal highway construction which far outstrips any reasonable assessment of this country's capabilities.

So for those reasons we hope that this committee will reexamine the program put to it by the Administration and come up with a better and a less ideological scheme for servicing the public.

Thank you.

Mr. MINETA. Thank you very much, Mr. Luby.

Let me ask Mr. Molofsky a question first regarding the 13(c) labor issues. From your testimony you talk about the 86 percent of the 450 grants that were submitted for review last year, and that those sign-offs came within one month. This percentage is a very high one and is very admirable to see that it is up there at 86 percent. I guess my question is: why isn't it 100 percent? I am wondering what it is that—could you share some examples of why you weren't able to get that 13(c) sign-off within one month?

Mr. MOLOFSKY. Mr. Chairman, I would make several points about that.

First of all, Congress has said repeatedly since 1964 that the 13(c) arrangements are to be the product of local negotiations among the grant recipients and the union representing its workers if there is one. That process, by the way, is administered by the Department of Labor, which receives the grants from the Department of Transportation, sends them to our office, and we then contact the recipients and begin the process of evaluating the grants to determine what unique issues, if any, we need to address.

The first question we always ask ourselves is whether or not we can simply re-use the pre-existing 13(c) agreement. I dare say in most cases that is the case, allowing for a fast turn around—often in two or three days.

In other cases we need clarification from the recipients explaining what the purpose of the grant is. Ofttimes they are not specifically clear as to what the purposes the money they are seeking is going to be put for. In other cases we have situations where there has been no prior 13(c) agreement to build upon, modify, or reuse, and we have had to negotiate new ones. You can understand that

takes some time. People's schedules sometimes require adjustment. We have to have usually a series of meetings with the recipients.

Once we reach agreement it is sent over to the Department of Labor, and then they go through a review process there before notifying ourselves or DOT of either agreement and approval or questions to be revised. I think we had in the last cycle that I referred to maybe 9 to 12 brand new agreements.

I would say more recently, however, the bulk of the problems—the handful of problems—have arisen because the recipients involved have sought basically to revise and to seek to take away protective provisions that have been in those arrangements for 10 or 15 years or more. We have been experiencing difficult negotiations by transit recipients seeking to remove protections which have created a stability within the work force and a stability within the labor relations structure in those cities—notably, the loss of interest arbitration.

At the same time, we have also struggled with different recipients on resolving certain privatization issues.

I would characterize the longest delays as those resulting from efforts by certain recipients to engage in take-aways of protective arrangements which the Department of Labor has previously certified and which they are seeking to perhaps now take advantage of a new Department of Labor less inclined to retain protections which have worked well in the past.

But throughout this whole process our effort is to reach an equitable agreement as fast as possible, to notify the DOL of that, and get the funding flowing.

Mr. MINETA. The recently-released national transportation strategy suggests that free market principles be brought to bear on urban transportation problems. It seems to me that is sort of a euphemism for forced privatization that we heard during the Reagan years.

I am wondering if you would amplify on the New Orleans experience regarding the cancellation of that private operator's contract that you referenced in your testimony and explain what implications that has as it relates to the national policy of privatization.

I would make four points on that. First, what happened in New Orleans I think reflects all too often what is happening around the country, which is an effort that may not be reduced in writing but is often heard on the phone or in other fashion by our grant recipients that if they don't demonstrate a renewed commitment to privatizing transit services something is going to happen with the timely flow of their grant funds. It has been experienced and commented on in Miami.

In New Orleans I think an aspect of that took place. UMTA basically tried to compel the city—and the city agreed—to privatize five bus routes at a time when UMTA was having its national privatization conference in the city. Although reluctant to undertake the contract, the transit authority decided to do so based upon an analysis which UMTA directed that they apply and compare the city's "fully allocated costs" of providing the five routes versus a bid proposal submitted by Greyhound.

When that analysis was done, it appeared to indicate that there would be some potential savings. At no time, I must tell you, was it

explored by the city with the understanding that any savings would translate into different or new service in the community. And, as Art said, that was not the case in Miami and, as I will comment in a minute, it was certainly not the case in New Orleans. Whatever savings were expected weren't designed to produce new service.

After a year or more of operation, the city transit authority decided and voted to cancel Greyhound's contract after only one year of its expected three years in operation. They looked at statistics which demonstrated that while the vehicle miles operated remained basically the same, traffic accidents doubled, the passenger accidents doubled, the percent of vehicle air conditioning and heating maintenance problems increased, on-time performance decreased slightly, revenue generated on the line decreased substantially, and the revenue generated per hour decreased. In fact, the cost per hour was higher.

So in almost all accountable areas the performance was not notable and, in fact, ended up costing the city anywhere from $500,000 to almost $1 million more in revenue to make up for the losses. It was on that basis that the regional transit authority voted to cancel Greyhound's contract.

I think what this case points out most clearly is two things: one, if UMTA is going to continue to insist that cities use the fully-allocated cost accounting method to compare the cost of operating service between the public and the bid operator, you are going to experience false cost savings on paper and, in reality, it may cost the city less to keep the service rather than contract it out. It is for that reason that we have been arguing and transit experts have uniformly said that the true comparison should be between a public agency's marginal cost of putting service out and a bid proposal and compare those costs to see what kind of real savings, if any, might be produced.

Secondly, I think it should be clear that any and all decisions on contracting out—New Orleans or elsewhere—shouldn't be imposed from the top from the Federal department or from UMTA. It should be a decision the local agencies choose to undertake with their own procedures and for their own purposes.

Thank you very much.

Mr. Luby, I strongly agree with your support for a continuation of the Federal operating assistance program. However, I am wondering if there are ways to improve the structure of this program to gain more widespread support for operating assistance funds, including possibly support from the Administration?

I am wondering, for instance, if you would support the removal of bus operator labor costs from the Federal operating assistance program if bus mechanic labor costs remained in the program.

Mr. LUBY. I would have to think about the ramifications of that. Generally we have not sought and don't believe that operating assistance should be used to pay wages. We feel that it should be used to cover the cost of operation of the actual transit authority.

And if there were principles written in there to assure that it was used for that purpose, I think that we—obviously, I have to examine the language and the format, but that is something that we generally are supportive of.

Mr. MINETA. Very well.

Mr. Rahall?

Mr. RAHALL. Thank you, Mr. Chairman.

Mr. Luby and Mr. Molofsky, we thank you for your testimony here today.

I would like to refer to the portion of your testimony in which you speak of the Houston settlement and the negotiated series of contracts there.

You have mentioned productivity incentives. Could you provide some specific examples of those productivity incentives included in TWU labor agreements which would further demonstrate your support for increases in transit productivity?

Mr. LUBY. Yes. They were bonuses based on the amount of safe mileage and the drivers' performances. Later on, those bonuses were converted into base wage increases.

That contract was entered into at first back in 1983 when, by all accounts, that system was falling apart. It was really the key factor in pulling the system back together again. Later on, of course, as with any group of people, you want the money in base wages instead of in bonuses. But, on the other hand, it was those incentives that improved driver performance and morale.

Mr. RAHALL. I have no further questions, Mr. Chairman. Thank you.

Mr. MINETA. Mr. Molofsky and Mr. Luby, let me thank you very, very much for your presentation. As we develop this legislation in the next 18 months, I am really going to need all of your help. I appreciate your input in this testimony.

Mr. MOLOFSKY. Mr. Chairman?

Mr. MINETA. Mr. Molofsky?

Mr. MOLOFSKY. Just one, quick closing remark. I want to express our appreciation to Mr. Rahall for his concern also expressed regarding the Greyhound strike situation. We remain deeply concerned about the service disruption in West Virginia and elsewhere around the country. Our union has been committed from the very beginning to seeking a negotiated settlement in this dispute. We attempted some mediation over the weekend and the company walked out. We have serious doubts as to whether they, indeed, want a negotiated agreement. We do. We are prepared to resume those negotiations at any time. I think you ought to know that.

We also remain very concerned with reports that the drivers continuing to be hired by the company are not receiving proper training. They are going through a very short, week-long program as opposed to the month or more that is normal under the company's requirement.

We think the committee ought to continue to monitor that situation and look into it. In the long run, it could seriously jeopardize the riding public's service.

Thank you.

Mr. RAHALL. Mr. Chairman.

Mr. MINETA. Mr. Rahall.

Mr. RAHALL. I would like to respond to what Bob has just said.

I certainly commend you and your people for the position that you have taken. I think it is a responsible one and it shows a con-

cern for the safety of the individuals involved. I appreciate that position.

Mr. MOLOFSKY. Thank you.

Mr. RAHALL. Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much.

[Mr. Molofsky's prepared statement presented on behalf of Jim LaSala appears on page 1159.]

[Mr Luby's prepared statement appears on page 1144.]

Mr. MINETA. I would now like to call forward Patricia Flinchbaugh, Secretary of the Community Transportation Association of America and Executive Director of Community Transit, Inc., in York, Pennsylvania.

Ms. Flinchbaugh, we are pleased to have you here. Your full statement will be made a part of the record. Please go ahead and proceed in your own fashion.

TESTIMONY OF PATRICIA FLINCHBAUGH, SECRETARY, COMMUNITY TRANSPORTATION ASSOCIATION OF AMERICA, AND EXECUTIVE DIRECTOR, COMMUNITY TRANSIT INC., YORK, PA, ACCOMPANIED BY DAVID RAPHAEL, EXECUTIVE DIRECTOR, COMMUNITY TRANSPORTATION ASSOCIATION OF AMERICA

Ms. FLINCHBAUGH. Thank you, Chairman Mineta and members of the subcommittee, for inviting me here today.

You are right. I would like to have the full testimony submitted in record. I will simply summarize my statement.

My name is Patricia Flinchbaugh, and I am Executive Director of Community Transit, Inc., a private, nonprofit agency providing conventional and specialized public transportation services to citizens of the city and the county of York, Pennsylvania. I am appearing today on behalf of the Community Transportation Association of America—CTAA—a national association that represents rural, small urban, and para-transit providers.

The agency that I head in Pennsylvania was formed earlier this year as a result of the merger of the York Area Transit Authority—YATA—a publicly-operated authority serving the city of York, and the York Transportation Club—YTC—a 16-year-old private, nonprofit agency serving our area's transit dependents through special para-transit services to the elderly and people with disabilities and providing needed transport to the rural areas of York County.

The merger of these two agencies reflects the growing awareness in our community of the importance of developing a balanced public transportation system—one that can serve all of our citizens effectively, efficiently, and safely.

CTAA is also a new organization, growing out of the merger last summer of the National Association for Transportation Alternatives—NASTA—and rural America. Its creation also reflects the coming of age of community transportation, that innovative and dynamic sector of our industry that supplements conventional public transit by providing a range of essential para-transit services in both urban and rural communities.

In barely nine months, CTAA has established itself as a major national voice for the more than 1,500 public transit agencies oper-

ating in rural areas and smaller cities and more than 5,000 human service agencies that provide basic mobility services to the nation's elderly, disabled, and others recognized as being transportation disadvantaged.

Each year community transportation systems such as mine provide more than half a billion rides to over 15 million Americans. I am happy to say that I was also a founder of CTAA and currently serve on its national board of directors.

Mr. Chairman, the transit reauthorization process that you are initiating provides an important opportunity to reassess the transportation needs of all American citizens and their communities, to review the effectiveness of current programs and policies intended to address those needs, and to outline a plan and budget for meeting those needs in the future.

These hearings and the inquiries that we hope will take place throughout the country over the next year also provide you with the opportunity to establish priorities and to put forward a view and even a vision as to the importance and role of transportation in our society.

The majority of Americans today enjoy an extraordinary freedom of movement because they have access to private automobiles and because the national transportation system works relatively well for them. However, as many as 84 million people, roughly one-third of our population, do not have access to personal transportation due to physical or mental disabilities, age, or because they are not licensed to drive or are unable to afford a car of their own.

This transit-dependent group includes 14 million older Americans and 12 million individuals with disabilities. It is the segment of our population that is most dependent upon adequate and affordable public transportation and the group that is the primary focus of CTAA's concern.

We within the community transportation movement believe that there is an urgent need to take a fresh look at national transportation policies to determine their adequacy and assuring full mobility for all members of our society. As a nation, we should commit ourselves to specific and measurable goals of eliminating individual and community isolation by the year 2000.

It should be the objective of such a ten-year campaign to assure opportunities and access to jobs, needed education and training, and to meet life's most basic needs without regard to place of residence, age, economic status, or disability.

In our statement today CTAA is recommending a number of specific proposals regarding the reauthorization next year of Federal transit legislation which, along with the passage of the Americans with Disabilities Act—ADA—we see as a major step toward our ten-year full mobility goal. Our recommendations are based on a set of principles that have been adopted by CTAA's board of directors.

National transit policy we believe should be guided by the following:

One, recognition that as many as one-third of all Americans are transit dependent. That means they lack access to a personal vehicle to meet their most basic mobility needs. In a time of limited

resources, it is our view that a first priority of transit policy must be to meet the needs of the transit dependent.

Two, recognition that almost half the nation's rural counties do not receive any public transit assistance from UMTA.

Three, recognition that as much as one-quarter of the Federal transit budget, $1 billion, is currently administered by the Department of Health and Human Resources and not by the Department of Transportation.

Furthermore, CTAA believes its specific proposals to reauthorize transit programs should accomplish the following:

One, to restore the Federal investment in public transit to a level commensurate with its human, social, economic, and environmental importance.

Two, designate a stable, dedicated source of funding such as an increased Federal gas tax to support all Federal transit assistance.

Three, to create a community transportation assistance program to assist rural and small urban communities to maintain existing and new operations.

And, finally, to create a national mobility trust fund to help finance the nation's renewed commitment to accessibility and individual mobility and to promote effective integration of all human service and public transit resources.

Mr. Chairman, in summary, we commend the subcommittee for its plans to undertake extensive reauthorization hearings, including field hearings, so that all sectors of the public can be heard. For the most part, the people that we represent, both those who operate and use community transit services, have not been recognized as part of the public transit community, but they have a lot to say and we hope you will listen.

In approaching next year's reauthorization, we urge you to take bold and imaginative leadership in assuring that mobility becomes a right for all. To accomplish this, CTAA believes we need to restore, stabilize, and restructure Federal transit assistance in order to establish a more balanced national transportation system.

That concludes my testimony. I would be happy to respond to any questions that you may have.

In addition, CTAA would welcome the opportunity to work with the subcommittee and its staff in the months ahead as you consider legislative proposals.

For your consideration, I have also brought with me today copies of a series of newspaper articles on rural transportation issues that was recently prepared by the Toledo Blade. Because of their educational value, I would hope that you would make them a part of the record of these proceedings.

Again, thank you for the opportunity to share our views with you.

Mr. MINETA. Thank you very much. That reference to those articles will be made a part of the record.

Ms. FLINCHBAUGH. Thank you.

Mr. MINETA. Regarding the issue of the required percentage of local share or the non-Federal match of transit projects, it is my understanding that your association supports a local share requirement which reflects a community's ability to pay the required share. I am wondering how that kind of a requirement would be

38-253 O—91——35

structured. The reason I ask that question is that I am wondering whether or not a local match requirement based on ability to pay doesn't discriminate against those communities which have dedicated local funding sources for transportation purposes unless you first required every community to dedicate the same percentage of its budget for transportation purposes or pass some kind of a dedicated funding tax if the community doesn't already have one.

I understand what I think the association is saying, but I am just wondering how that would be structured so it doesn't tilt against some of the communities that may not have the resources available.

Ms. FLINCHBAUGH. I understand, Mr. Chairman. I would like to introduce David Raphael, who is the executive director of our association. I would appreciate it if he could assist me with a response.

Mr. MINETA. Mr. Raphael?

Mr. RAPHAEL. Thank you, Mr. Chairman.

First of all, we are in favor and do support the notion of local match. We think it is an important measure of a community's commitment. I think that position and our concern grows out of evidence of the last year or so with the promotion, particularly in the discretionary grants program, of the overmatch concept.

This seems to us to reward in an environment in which many of the rural, smaller communities have really not fared very well in the competition for discretionary funds. This tends to reward, in our opinion, communities with greater resources and, in effect, those that have get and those that don't suffer.

We have tried, without working on details and without dealing with the full implications of your question, to think that income and ability to pay and ability and willingness of a community to tax itself and make a commitment toward transit is an important measure, and that would vary very considerably from a small both well-off and not-so-well-off rural county, for example. And they should neither, we think, be required to come up with the same match, nor should the advantages that one community has allow it to, in effect, get a leg up in the competition for the resources. We would attempt to look to income and not let people hide behind a refusal or an unwillingness to commit but, in effect, assume a measure of ability.

Mr. MINETA. Have you also found that by providing these kinds of services that there is definitely a switch from a person driving themselves with one person in a car to community transportation services that people are willing to make that move?

Ms. FLINCHBAUGH. Yes, if there is adequate transit available.

Mr. MINETA. What is that adequacy? Is it——

Ms. FLINCHBAUGH. It may——

Mr. MINETA. In terms of time and cost, are they willing to pay 50 percent more, 100 percent more in terms of how much it costs? Are they willing to sacrifice maybe 20 percent more time, 50 percent more time to get out of their car to go to an alternative transportation source?

Ms. FLINCHBAUGH. In my community—I can only talk about my community.

Mr. MINETA. Sure.

Ms. FLINCHBAUGH. I can tell you that the people who require the transportation as it relates to employment, for instance, probably have one car in the family. We have found it very difficult to transport those individuals to second and third shifts. In other words, they can obtain employment if, for instance, work began at 3:00 in the afternoon. Through a public system they are able and are willing to pay maybe up to $2 for a one-way trip to their place of employment. However, the return trip home is impossible to receive because that is at 11:00. The same is true of anyone that is going to work at 11:00 if they were to return home at 7:00 in the morning. They can do one half of the trip, but not the other.

We find that element of need is very high in our community. These are quite possibly entry-level jobs; nevertheless, these are individuals who are either the second employee or individuals who are trying to make it on their own and become independent.

In our community also, because of the area—we have about 1,200 square miles—many people who are employed at Caterpillar and industries such as that probably would not use the public system as we know it, but that is only in our county.

Mr. RAPHAEL. Mr. Chairman, nationally, for the most part, community transportation services really distinguish themselves from the more conventional public transit services. They are not really attempting to compete or serve as an alternative to a private auto. We are talking, for the most part, of very basic services, basic mobility. These are trips that would not be taken. This is access to medical care in many cases and/or jobs for people whose private alternatives are very limited.

So in this area, particularly in smaller communities and rural areas, we are not dealing with an alternative to congestion and a reduction of the use of private autos. We are really talking about providing people opportunity to move and the freedom of movement in their community that they do not have without that kind of public support, whether that is a private agency or a publicly-operated agency.

Mr. MINETA. Thank you very much.

Mr. Rahall?

Mr. RAHALL. Thank you, Mr. Chairman.

What do you believe is the proper funding balance to strike between Federal transit assistance to urban and rural areas? What would lead you to that conclusion?

Mr. RAPHAEL. That is a difficult question. Let me explain how we see the world right now and talk to you about what we have been arguing for.

At the current time we see a very inequitable situation with the distribution of Federal transit assistance. Rural areas and non-urbanized areas contain roughly 39 percent of the nation's population as the Surface Transportation Act defines areas, and is allocated 2.93 percent of the funding.

Smaller communities, small cities, and rural areas have virtually no access currently to the mass transit account, with the exception of modest funding out of this 16(b)(2), the elderly and handicapped vehicle program.

What we have, consequently, is a situation where on a per capita basis the Federal Government expends in the neighborhood of in

excess of $24 per capita in urbanized areas and more. The larger the community, the higher the per capita allocation of UMTA funds.

In contrast, in rural areas UMTA assistance amounts to roughly $1 per capita.

Now, it is difficult to talk about equity in these last several years with either a static or a declining funding balance. We have urged that, at a minimum, that rural share be doubled, but we really have tried and are trying in our testimony and in our work with the committee through these reauthorization hearings to get recognition that rural areas have, in many cases, some very similar needs. We are not talking dollar-for-dollar equity, but I think there was a long period of time when it was assumed that transportation services were not necessary in rural areas where everyone had a car or at least a pick-up truck and they could get by.

We think we are far beyond that. We think systems such as Pat Flinchbaugh's in York and throughout the country demonstrate that there are professionals in community-based systems throughout the country that are starving for resources. We are operating at a considerable loss today than in 1979 when the program began.

We have supported modest legislative proposals that have come in over the last couple of years aiming at a doubling of the rural share. We think that is a minimum step in the direction of equity.

Mr. RAHALL. Thank you.

Mr. MINETA. I have no further questions. I would like to thank you very much Ms. Flinchbaugh for coming here and making this very fine presentation.

Ms. FLINCHBAUGH. Thank you.

Mr. MINETA. And to you, Mr. Raphael, and to your association, thank you very much for your continued help.

Ms. FLINCHBAUGH. Thank you so much for having us.

[Ms. Flinchbaugh's prepared statement appears on p. 1111.]

[Ms. Flinchbaugh's newspaper articles on rural transportation issues appear on p. 1224.]

Mr. MINETA. At this time we now have a call of the House for a series of votes. There will be one vote lasting 15 minutes and then there will be five votes on suspensions, five minutes each. It will be at least an hour before we are able to reconvene and so I will recess at this point.

[Recess.]

Mr. MINETA. The subcommittee will please come to order.

We are pleased to have with us this afternoon a very good friend, Harriet Parcells, Transportation Association, National Association of Railroad Passengers; and Sara Nichols, Staff Attorney for the Delaware Valley Citizens Council for Clean Air and Environmentalists for Public Transit.

We are pleased to have both of you here on this panel together. Your statements will be made a part of the record.

Harriet, please proceed in your own fashion.

TESTIMONY OF HARRIET PARCELLS, TRANSPORTATION ASSOCIATE, NATIONAL ASSOCIATION OF RAILROAD PASSENGERS, ACCOMPANIED BY SARA NICHOLS, STAFF ATTORNEY, DELAWARE VALLEY CITIZENS' COUNCIL FOR CLEAN AIR, AND ENVIRONMENTALISTS FOR PUBLIC TRANSIT

Ms. PARCELLS. Mr. Chairman and members of the committee, I want to thank you for the opportunity to testify before this subcommittee this afternoon on the future of our nation's surface transportation system.

My name is Harriet Parcells, and I am a transportation associate with the National Association of Railroad Passengers, a consumer organization working for a more balanced national transportation system.

This testimony is offered on behalf of our association, as well as the following national environmental organizations: Friends of the Earth, the League of American Wheelmen, the Natural Resources Defense Council, Environmental Action, and the Rails to Trails Conservancy.

We are living in times of spectacular worldwide change. Events are taking place at a dizzying pace in Eastern Europe—events not believed possible several years ago. In Western Europe, nations are joining together to create by 1992 a formidable trading partnership, linked together by efficient, high-speed trains.

If the United States is to remain competitive and meet the challenges facing the country and the planet, fundamental changes in transportation priorities and investments must take place.

U.S. transportation stands at a critical crossroads. Construction of the interstate highway system is virtually complete. Major cities across the country are now connected by a high-quality road network. It is time for a new transportation vision.

Investment in mass transit, intercity passenger rail, HOV, bicycle, and other alternatives to our flying and driving alone habit must become a national priority, with strong Federal leadership backed by strong Federal funding. The economy, the environment, safety, and the quality of life in our cities will all be enhanced. Continued over-reliance on highway building solutions is neither desirable nor helpful in the long run. Current policies and fundings result in costly inefficiencies wherein:

Cities choke under growing auto and truck traffic and the accompanying air pollution, yet Federal investment in mass transit that would help alleviate these problems is inadequate and declining.

Peak hour auto travel strains urban road capacity, yet the Federal tax structure encourages people to drive alone to work rather than use mass transit or carpool or vanpool.

A growing number of big, heavy trucks is accelerating deterioration of our highways and bridges, while rail freight capacity, which could move goods with less pollution, greater energy efficiency, and reduced road damage costs, is under-utilized.

And airports and airways suffer from growing congestion, while investment in expanded and improved intercity passenger rail service that could ease airway congestion is neglected.

Twenty years after enactment of the Clean Air Act of 1970, air pollution remains a pervasive national problem. More than one out

of two Americans live in areas that fail to meet the healthy air standards mandated by Congress. The leading cause of nonattainment is auto and truck emissions.

Stemming the growth in vehicle miles of travel is essential to attaining clean air. Stricter auto tailpipe controls, which we support, will not do the job alone. Until now, removal of the dirtier, pre-1981 cars served as an offset to growth in vehicle miles of travel; however, the Environmental Protection Agency estimates that after 1995 these cars will be off the road and no longer available as a VMT offset, and thus after 1995 it is projected that the major mobile source emissions will begin to increase for the first time in 20 years.

Clearly, we must not only make cars cleaner, but we must provide good alternatives to auto use and we must get serious about making regional transportation planning and investments conform with air quality plans for the region.

President Bush has staked out environmental protection as an area of concern, and he called for a policy of no net loss of wetlands. A shift from road-building solutions to greater reliance on auto alternatives is key to meeting these commitments.

While we support the priority the Administration has given to development of a national transportation strategy, we oppose its policies that back the Federal Government away from leadership in transit, rail, and other areas at a time when such Federal leadership is absolutely essential.

The section of the national transportation strategy dealing with national security talks about an improved sea-lift program and other areas, but not a word is mentioned about the real threat a rising dependence on foreign oil poses to national security.

Use of petroleum for transportation now exceeds total U.S. petroleum production. Per capita gas use in U.S. cities is 4.5 times that of European cities and 1.5 times greater than neighboring Toronto. Investment in transit and good land-use planning can play a key role in reducing our oil gluttony.

Within the United States, spread out auto-oriented cities like Houston and Phoenix use 40 percent more gas per capita than transit-oriented, more compact cities like New York and Chicago. Cities where the proportion of work trips by transit is greatest are those with the lowest gas use per capita.

Americans use good transit when it is provided. Surveys and experience in cities where Americans are provided with efficient, reliable alternatives to driving or flying demonstrate that Americans will leave their cars at home. Those who suggest otherwise use such rhetoric as a means of justifying cutbacks in Federal funding of these vital modes.

Light rail systems that have opened in cities such as Portland, Oregon and San Diego, California have proven cost effective, exceeded ridership projections, and help promote energy efficient land use patterns. These are the kinds of cities where opponents say rail transit can't work. Well, it is working and citizens are calling for expansion.

In Portland, commercial development that has occurred along the light rail line exceeds public construction investment, and

weekend ridership is far higher than projected, indicating that citizens are using the system for shopping and non-work trips.

The year 1989 was the seventh consecutive year that passenger miles on Amtrak rose over the previous year, and all indicators are that 1990 will be the eighth year.

There were 21.5 million Americans that chose to use the train rather than fly or drive. Many more would use rail service if Amtrak had sufficient funds to invest in needed capital and expansion of service.

Federal tax policy concerning commuter tax benefits is backwards and counterproductive. It essentially pays people to drive alone. Under current tax law, employers can provide free parking, a tax-free benefit worth $200 to $400 a month in major cities, but only $15 a month can be provided for employees who use more environmentally-sound mass transit. And if an employer wants to provide more than $15 a month, the entire benefit becomes taxable. We think this is absolutely the wrong kind of policy.

Federal tax law could offer, instead, a monthly tax-free commuter benefit—say $60 a month—which employees could apply to the mode of their choice—purchase of a transit pass, toward parking costs, or pocket it if they walk or bike to work.

We support legislation introduced by Representative Matsui to increase the mass transit tax-free benefit as a step toward creating a more level playing field.

We believe it is time to begin charging highway users for a greater share of the costs they impose. We support implementation of congestion pricing to charge those who travel at the peak hour and impose the greatest cost a higher price than those who travel in the non-peak hours. Americans accept this practice without question in other areas such as telephone rates. Carbon taxes or smog fees should also be examined.

We also support an increase in the Federal gasoline tax, with revenues directed to investment in mass transit, Amtrak, HOV, bicycle and pedestrian facilities, and for State purchase or preservation of railroad lines that are being abandoned that can serve as vital transportation or recreational corridors. A portion of the revenues should be used to offset any negative impacts that might have impacts on low-income families.

This gas tax recommendation was a key recommendation of the Blueprint for the Environment that was presented by 30 national environmental groups to President Bush.

Finally, the growing number of heavy trucks travelling U.S. highways accelerates highway and bridge deterioration, yet State and Federal studies show that heavy trucks are significantly underpaying in taxes compared to the damage they cause.

We recommend enactment of a national weight distance tax on heavy trucks and oppose further increases in truck size and weight. These were also recommendations of the Blueprint for the Environment.

The National Association of Railroad Passengers, joined by the Sierra Club, the National Taxpayers Union, and Friends of the Earth, will shortly issue a booklet on the subject of trucks and road damage which we will provide to the committee.

Thank you, Mr. Chairman and members of the committee, for the opportunity to appear here.

Mr. MINETA. Very well. Thank you very much, Ms. Parcells.

Sara Nichols, Staff Attorney, Delaware Valley Citizens Council for Clean Air and Environmentalists for Public Transit. Please proceed.

Ms. NICHOLS. Mr. Chairman, thank you for this opportunity to share my concerns about transit and how it relates to air quality.

I am the staff attorney with the Delaware Valley Citizens Council for Clean Air. The Council is a nonprofit citizens environmental organization devoted to protecting the public health and welfare through a cleaner environment.

Founded in 1967 on the belief that everyone is entitled to breathe clean air, the Council's primary goals are to inform citizens about the adverse effects of air pollution, to organize citizens to act on their own behalf, and to oversee the activities of government environmental agencies. That oversight includes suing government agencies for failure to implement the law.

The two organizations I represent, the Clean Air Council and Environmentalists for Public Transit, believe that an understanding of what we are doing to our environment will make mass transit one of the key environmental issues of the 1990s.

We all are engaged in an experiment, the potential consequences of which may be of catastrophic proportions, second only to nuclear war. Global warming is, indeed, here. The only debate concerns the gravity of the consequences.

Whatever those consequences are, they will be worse than what we are experiencing now. Put simply, we are currently sustaining billions of dollars annually in health costs and environmental damages. We simply cannot afford the status quo. Whatever we can do to counter its effects we must do as expeditiously as possible.

Excess carbon dioxide is the principal greenhouse gas. Although the United States represents only 6 percent of the world's population, it produces 25 percent of the world's total excess CO_2. According to the Department of Energy, about one-third of that amount comes from mobile sources.

As vehicle miles traveled increase—and all projections show that it surely will—transportation will continue to be the sector from which CO_2 emissions grow most rapidly.

Global warming is not the only air pollution consequence with which we must concern ourselves. Tropospheric ozone is a greenhouse gas but poses its own set of unique hazards. Depending on the amount of heat and sunlight on a given day, motor vehicle emissions contribute anywhere from 40 to 60 percent of the gases that are precursors to the formation of ozone.

In a recent EPA study, Unfinished Business, ozone was characterized as the environmental problem which poses the greatest risk to human health and the environment. It certainly is one of the most insidious, as well. Over half of our population lives in unhealthful ozone areas. We who are among the millions of people living in ozone nonattainment areas cannot step out of the way to avoid breathing in ozone, as we could step out of the way to avoid being hit by an oncoming train. It is there. We have no choice but to breathe it.

Studies show that prolonged residence in high ozone areas is associated with accelerated deterioration in pulmonary function. Ozone scars the lungs and epithelial cells which line the trachea, increasing the incidence of infection.

The Federally-established national ambient air quality standard—NAAQS—for ozone is 0.12 parts per million. While at this level or above, the elderly, people with pre-existing respiratory impairment, and pre-adolescents are the most vulnerable to ozone's effects, recent studies show serious effects on young children who are exposed over long periods of time to levels below the Federal standard. In fact, healthy adults who regularly exercise outdoors experience negative effects from ozone at the Federal health standard.

Symptoms of ozone exposure at .12 parts per million include coughing, shortness of breath, throat dryness, pain on deep inspiration, wheezing, lassitude, headaches, and nausea. Because of ozone's high reactivity, there is a serious concern about the synergistic effects of its interaction with harmful substances such as respiratory viruses, cigarette smoke, and other harmful pollutants.

Annual estimates of the national health costs and lost productivity costs range around $40 billion. However, a recent American Lung Association study puts that figure as high as $93 billion.

Nationwide, ozone is responsible for billions of dollars of damage each year to crops and forests. It is a burning agent which causes leaves to turn brown. It stunts plant growth by reducing photosynthesis, forcing plants to redirect their energy to making repairs, thus making them more susceptible to pest infestation. The effects of ozone and acid rain—which also is caused in part by motor vehicle emissions—together are worse than either is alone. My home State of Pennsylvania has one of the nation's worst acid rain problems.

Motor vehicles are the largest source of hydrocarbon, carbon monoxide, and benzene emissions. Automobile air conditioners are the largest source of our nation's contribution to the depletion of the life-sustaining stratospheric ozone layer.

Between 1977 and 1988 the number of automobiles increased 25 percent and the number of trucks increased 40 percent according to the National Highway Traffic Safety Administration. As a result, much of the air quality progress that we otherwise would have made has been offset by the tremendous increase in the number of motor vehicles.

According to the Delaware Valley Regional Planning Commission, VMT in the region which I live will be 29 percent higher in the year 2015 than it was in 1987. This sharp increase in traffic congestion will generate more air pollution, economic inefficiency, and a tremendous waste of energy. Not one of these can our nation's physical and economic health afford.

Extraordinarily enough, the pending clean air legislation does not treat mass transit as the major air pollution control strategy that it potentially is. It should be a mandatory air pollution control strategy in every nonattainment area. It is time to look dispassionately at the monster our addition to the automobile has created.

We all breathe the same air. It is the air we have borrowed from our children. We do not have a right to compromise the quality of

life for future generations. More than anything, our addiction to the automobile is doing precisely that. It is a course of behavior in which we no longer can indulge ourselves.

Mass transit is the most reasonable way to alleviate the problems caused by our over-dependence on the automobile. Without viable public transit systems, people will not give up their cars and our air quality will continue to deteriorate.

If one factors in such extras as highway construction, road repair, police patrols, paramedic services, and lost property taxes and wetlands when land is converted to highways, our taxes are subsidizing each car and truck each year approximately $2,350, for a total of $400 billion annually.

There is no telling what that subsidy would escalate to if one were to factor in the thousands of traffic fatalities—which are almost the equivalent of our Vietnam fatalities every single year—and the injuries each year, as well as the environmental costs of ozone and carbon dioxide pollution, acid rain, urban sprawl, noise pollution, the greenhouse effect, loss of animal habitat, accidental oil spills, the annual improper disposal of 474 million gallons of used motor oil—which is the equivalent of about 43 Exxon Valdez oil spills every year—desecration of our national parks and oceans from oil drilling, and countless other environmental assaults directly linked to our use of the automobile. Our tax dollars pay for this degradation. Indeed, our tax dollars encourage it. Federal funding favors motor vehicles at least eight to one over mass transit. Our priorities are absolutely insane.

Public transit truly is cheap by comparison. It is ironic that whenever public transit is brought into the debate the cries of unaffordable government subsidies are deafening.

Mass transit, relative to the automobile, is environmentally benign and cost effective. It consumes much less space than that required to accommodate motor vehicles. Indeed, half of the land in the average U.S. city is utilized for or by motor vehicles.

Mass transit is safer than motor vehicle travel. And, in view of the increasing congestion and resulting decrease in speeds on the nation's highways, mass transit potentially is faster and more efficient, too.

Since 1981, taking inflation into account, Federal funding for mass transit has decreased by 50 percent. Our environmental President Bush and Transportation Secretary Skinner want to gut Federal funding for mass transit. This makes no sense.

The President calls his national transportation policy "Moving into the 21st Century." At the rate we are going, we will be standing still in the 21st century. Traffic gridlock today costs the U.S. $73 billion a year in lost productivity.

While the capital outlay for viable mass transit systems nationwide would seem prohibitive, consider the fact that in order to bail out the greed-infected savings and loan industry the Federal Government recently authorized an amount greater than all Federal funding for mass transit in the past 25 years. In 1986 the Pentagon spent Amtrak's total 1986 budget in 17 hours and 48 minutes.

We deserve a failing grade in environmental management, and I hesitate to say if myopia were terminal Washington would be a ghost town.

The cities of the U.S. are the world's biggest consumers of gasoline. Thirty-seven percent of all oil consumed in the U.S. is guzzled by cars and light trucks. According to the American Petroleum Institute, the nation's dependence on imported oil rose to 54 percent in January. It does not take a scholar in economics to foresee a crisis in those figures—especially with countries like Iran and Iraq in control of much of the world's known reserves of oil.

The average U.S. car gets 18 to 20 miles per gallon. Each mile it travels it creates one pound of CO_2 emissions. If you travel 10,000 miles a year in your car, you are responsible for over five tons of excess CO_2 in the air.

If the cost of owning and operating a motor vehicle internalized its true external costs, we would see an abrupt end to our addiction to the automobile. We either pay for our mistakes now or we pay more dearly for them later.

The perception seems to be that changing our behavior will be very painful. Consider the fact that Americans consume per capita about twice as much energy as the Japanese and the West Germans, yet our standards of living are comparable. In the U.S. the portion of passenger miles traveled by train is about 2.5 percent. In West Germany it is close to 60 percent, and in Japan it is close to 90 percent.

Our economy, our national security, and, most importantly, our environment are all being compromised by our fossil fuel gluttony. Air pollution does not respect air quality jurisdictions. This is a national problem that requires a national solution. Substantial Federal funding for mass transit is a must if we are serious about cleaning up our air and reducing our dependency on foreign oil.

As an old Chinese proverb goes, "Unless we change our direction, we are likely to end up where we are headed."

Thank you.

Mr. MINETA. Thank you very much. I guess we don't want to do that.

Ms. Parcells, in your testimony you mentioned that the United States "must get serious about making regional transportation planning and investment conform with air quality goals" in that region. I am wondering how you specifically propose to do this.

Ms. PARCELLS. Currently there is a section 176(c) of the Clean Air Act that requires that regional transportation investments and plans be consistent with the State implementation plan for air quality. There is a memorandum of understanding that was drawn up in 1980 between the Department of Transportation and the EPA in order to implement that.

Unfortunately, the memorandum of understanding is significantly flawed in our opinion. Under it, it basically says that you can undertake various kinds of measures as long as they do not interfere with transportation control measures. We believe that we should be affirmatively supporting alternatives to VMT increasing measures, and we would like to see that affirmative language incorporated and the MOU strengthened.

The Senate clean air legislation that is being debated, S. 1630, actually has some language to strengthen the conformity requirement, and it is my understanding that it is not included currently in the House legislation.

Mr. MINETA. What about, in that regard, land use planning? Is there any spill-over there in terms of what might be done on land use planning?

Ms. PARCELLS. One of the things that I didn't mention in my oral statement but that is in our written statement is that we would like to see the regional planning process strengthened and not diminished. We think that the MPOs are there as entities throughout the country, and we think that their ability to do land use planning could be strengthened. I don't have specific recommendations at this point. It is something that we will be looking at. But certainly we think land use planning is critical in terms of closer linkage with transportation investments, and we strongly support the 3C process.

Mr. MINETA. One of the things I am going to be working on is this whole issue of flexibility in transportation funding. My feeling is that in order to do or to have flexibility you also have to have a strong MPO. As you survey the MPOs across the country, are you satisfied that we have strong MPOs to be able to allow flexibility to be exercised at that local level?

Ms. PARCELLS. I think I would need to look into that issue more, but my understanding of the MPOs is that in many cases they are only advisory and that many things can take place that perhaps might not be in the best—in our opinion it may allow excessive growth beyond what would be best for air quality.

I think we would support strengthening of the MPOs and their land use planning abilities. But, as I said, I don't have specifics at this point.

Mr. MINETA. Your association opposes the addition of tens of thousands of new lane miles of highways in this country's urban areas, as has been proposed by some other groups. If I am correct in understanding from this that your association opposes the mapping of a new system of highways of national significance, how would you suggest that a new Federal highway and transit program be structured?

Ms. PARCELLS. Well, I think our strong feeling is that there needs to be a reversal of priorities. Right now Federal funding for highways at $13 billion or $12.5 billion annually is four times the $3 billion that we provide for mass transit. I think we need to reverse that or to shift the balance.

We think that trying to over-rely on highway building solutions is really not going to solve the problem because it will encourage further auto-dependent sprawling development that, in the long run, will increase congestion and increase pollution.

Mr. MINETA. Again, from a land-use perspective, should that be done from a Federal level?

Ms. PARCELLS. I think the Federal Government should take a strong role in funding of mass transit, both capital and operations, and coming up with some way to strengthen the regional government's ability to do land-use planning.

Mr. MINETA. Ms. Nichols, I share your concerns about the serious air pollution problems that we face in this country, as well as the failure of the statement of national transportation policy to include an increased Federal commitment to transit as a possible solution.

Since your organization does support increased Federal funding for transit projects in clean air nonattainment areas, how would you structure a Federal transit program which targeted these areas?

Ms. NICHOLS. Well, our organization, in conjunction with Harriet's, endorses a gasoline tax. I think the commitment from that tax should go primarily to funding mass transit, then, after that, HOV lanes and carpools and vanpools. Have a priority which has mass transit at the top because mass transit can move the largest number of people most efficiently using the least amount of space and the least amount of fossil fuel.

Mr. MINETA. When you say that mass transit improvements are highly desirable, as I understand it from that answer you are including high-occupancy vehicle facilities within your definition. If that is the case, then how would you rank the relative merits of HOV lanes as compared to other transit improvements? You would put mass transit first?

Ms. NICHOLS. Absolutely. HOV would be down on the list. If there are going to be appropriations for highway funding, I would tie them to HOV lanes. Any highway funding in urban areas would have to include HOV lanes. But, moreover, when you look at the numbers of people that can be moved by mass transit versus the numbers of people that can be moved in automobiles, it makes absolutely no sense from an economic point of view, from an environmental point of view, from a national security point of view, to have priorities that encourage more use of the automobile. I think that everything we do should discourage the use of automobiles.

We are going to run out of fossil fuels one of these days, and——

Mr. MINETA. No question about it.

Ms. NICHOLS [continuing]. Before we do we're going to be held up by the Ayatollahs and the Khadafis of the world. I think that is the reality we had better hurry up and face up to.

Mr. MINETA. But what do we do? I think it was in your testimony where you talked about the older communities that have the higher use of transit. Was it yours? There was some reference to——

Ms. NICHOLS. It might have been the Sierra——

Ms. PARCELLS. I think that was my testimony, actually, with the—

Mr. MINETA. Was it yours?

Ms. PARCELLS [continuing]. Lower gas consumption per capita.

Mr. MINETA. All right. Let's take a look at it. You used Houston and——

Ms. PARCELLS. Right. Phoenix.

Mr. MINETA [continuing]. Phoenix as an example. The mass transit system in New York was built in 1898 or 1906.

Ms. PARCELLS. Yes.

Mr. MINETA. In Houston I think they still were driving cattle through that area at the time. It seems to me that what—and I am not quarreling with you in terms of what has to be done, but I am just wondering how we impose a transit system—let's say like a New York—in a Houston or Phoenix where in New York the density of population may be 21 dwelling units to the acre and in San Jose it is probably 4.8 dwelling units to the acre. If you really want

mass transit to work you have got to have concentration and movements of people from point A to B to C to D, and in these areas you have sprawl. That is something that is there.

Now, are we going to reverse that today? I don't know how you are going to do it. I see people nodding heads saying yes we are going to do it. Tell me how you are going to do it.

Ms. PARCELLS. First of all I would like to point to a number of the western cities that are moving ahead with light rail, for example. I am not saying that we could take necessarily a heavy rail, an extensive system like you have in New York, but——

Mr. MINETA. I'll take even light rail. I am building a light rail system in our area. We are spending a lot of money. It is only 40 percent Federal, I think. It might be 30 Federal and 70 local. We passed a half-cent sales tax because there isn't response from the Federal Government to what we are doing there. So we tax ourselves to do it. But it is going to be a long time before we get people from their cars into the system.

Our HOV in Santa Clara County is two or more people. If I put HOV-4 in Santa Clara County I could lay out there all day long and not get hit by a car. [Laughter.]

Now, how are we going to afford the cost of getting over that hump? If it takes us 12 years to get there, are we going to be absorbing that cost at the local level continually during that time period? It is easy for you to say yes, but I want you to come out and try and convince the people to vote for SCA1 on June of this year. We are going to try to do that. We only have 37 percent who are saying to go ahead and increase the gas tax for transit and transportation purposes. Right now we only have 37 percent of the people saying let's do that.

Ms. PARCELLS. I think the one real benefit, an overriding benefit of mass transit, whether it be light rail or a heavy rail system, versus carpool and vanpool lanes is the impact that it can have—the very real impact it can have on land use. Rail transit can be used as a catalyst in bringing about more energy-efficient land use patterns.

The Transportation Research Board sponsored a conference on the future last spring that I attended, and the National Planning Association projects that there are many——

Mr. MINETA. Harriet, the problem is: if I had my choice today—the problem is the choice had already been made 20 years ago. The land use is already in place. Now, do I go in and rip out the 3.7 or 4.2 dwelling units to the acre right now and say we are going to come in and rezone that land?

I was at Campbell City Council just the other day to be part of a presentation at the City Council meeting and I decided to stay for the City Council meeting because I haven't been in a City Council meeting in a long time and I thought it would be sort of interesting to watch.

The City Council had a rezoning proposal for an area that has 7 dwelling units to the acre right now to go to 11.2 dwelling units to the acre. The protest from the neighbors in that area was horrendous. They said, "Not in my back yard." Frankly, the design of that new subdivision was a heck of a lot better than what existed.

But it is just the fact that they saw all the sudden 11.2 dwelling units to the acre versus 7.

Now, you can say if they had better transit maybe you would have less cars, or whatever. But the whole issue of land use planning and trying to go into a neighborhood that is existing—look at what happened when Rockefeller sold his estate here and they made 200 homes out of that 200-acre site. People came in protesting because there was one house on 200 acres there and now they were going be 200 homes on 200 acres. I remember one lady who said, "And we don't want these $500,000 ticky-tacky houses in our neighborhood." I thought that was a real good elitist snob approach to take.

But, nevertheless, I wonder how this is going to be done.

Ms. PARCELLS. Well, I live in Montgomery County and one of the things I think that needs to be done is to develop a network also of feeder systems. If you have a light rail that goes along the more dense corridor, then you have to have something like the Montgomery County Ride-On system. You have to establish feeder systems in your lower-density neighborhoods.

When I moved out to Glen Echo there was no subway, there was no bus system. Now people in our neighborhood who used to regularly drive to work can hop on the ride-on, take it to the Bethesda Metro, and get downtown.

I think we need to be doing a variety of things. We need to create a network. I think even in this region we can be looking at—why shouldn't we be looking at some circumferential light rail? We have built a beltway around the region. We can begin to make some logical connections that go suburb-to-suburb, as well.

Mr. MINETA. Then why don't we just let the Montgomery County people pay for that?

Ms. PARCELLS. I think that they will pay part of the share, but I also think that it is in the Federal Government's interest because of the benefits both to the environment, to national security, reduced oil dependence. I think there is a strong Federal interest in getting people out of their cars, so the Federal Government maintains a national interest in promoting those kind of systems.

Ms. NICHOLS. May I comment?

Mr. MINETA. Absolutely.

Ms. NICHOLS. It seems to me as though you are arguing for the fact that this is a national problem. Last summer when the EPA study came out designating which areas were nonattainment and to what degree Lancaster County, where the only air pollution really ought to be from horse manure, was nonattainment. Nobody could—the press picked that up and thought this was just mind boggling. How can Lancaster County be nonattainment? That is because Baltimore's air came down on Lancaster County.

And to the extent that the air transports anywhere the winds take it, it doesn't matter whether it is in my State or yours. It is a national problem, and therefore the national government has to take the lead on providing at least a substantial amount of the funding to promote mass transit.

Unless we do that, we are going to find ourselves literally standing still in terms of any kind of developing we can do. Right now whenever I have to drive into the city of Philadelphia it is a verita-

ble nightmare, and yet we have just spent millions and millions of dollars redoing the Schuykill Expressway. It filled up instantly. Yet SEPTA, the transportation authority in the Philadelphia area, is hardly making it paycheck to paycheck. There is just mind boggling insanity in an approach that thinks that the more roads we build the better off we are going to be.

There was a blue route that was just finished—they call it the "blue route"—just finished outside of Philadelphia. They tore through housing developments, they tore through schools, they tore through communities to build that road. That is to save about 15 minutes in a ride from one side of the city to the other.

And, on top of that, every trip on that blue route is subsidized $3.15. I wish every trip I took on SEPTA were subsidized $3.15.

Our priorities just don't make any sense. This is a national problem, it has got to have a national solution. If the air pollution I make in Philadelphia came down on my head, that is one thing. But it doesn't. It comes down on the heads of the people in New York City and it is killing the lakes in the Adirondacks, and Ohio's pollution is killing the lakes in Pennsylvania. Forty-five percent of our lakes are fouled with acid rain—45 percent. We did have a thriving fishing and recreation industry in Pennsylvania that is being demolished by acid rain.

So it is not just a question of who is going to pay for mass transit in this little community. Without it, people can't fish in Pennsylvania. Grandmothers can't get to work in Lancaster County. It is a problem that we have just got to stop looking at locally. It is a national problem with national significance.

Mr. MINETA. How would you answer the earlier panel that was here from the State of Ohio? I don't know if you were here.

Ms. NICHOLS. I wasn't here.

Mr. MINETA. Okay. Again, they bring up one aspect of this problem of the donor States and whether or not they are getting their fair share back into their community as it relates to highway moneys. We have the authorization levels probably at more than a sufficient level. We haven't been able to get the amounts appropriated to do a lot of these things. I guess I just get very frustrated with the kinds of correct issues you bring before us, but I just don't see it happening.

Coming up with a new authorization measure that increases authorizations to be spent on these things frankly isn't going to do it. That is just one piece of——

Ms. NICHOLS. No. We have the lowest cost fuel almost in the whole world. I don't know whether you have spent much time in European countries, but the fuel tax there is very high, and mass transit there is fabulous. You can get anywhere anytime practically on mass transit——

Mr. MINETA. Sure, but what is the density——

Ms. NICHOLS [continuing]. In most European countries.

Mr. MINETA. Again, the density of population, of movement of people——

Ms. NICHOLS. In the middle of nowhere in Sweden they have public bus stops. You can drive two or three miles and not see a building but there will be a bus stop right there.

Mr. VALENTINE. Excuse me. I have——

Mr. MINETA. Mr. Valentine. I'm sorry. Go ahead.

Mr. VALENTINE. Excuse me. I just wanted to ask the ladies a question and to draw to their attention another set of priorities and also mention what I think is another insanity.

I don't disagree with what you say about fuel and about the fossil fuel and about the protection of the environment and that sort of thing. Those are all commendable objectives. And I think there is a national need to move people efficiently and effectively in the metropolitan centers throughout the country.

But let me tell you another sad story.

There was a very bad sounding story in today's Washington Post about the State that I represent that pointed out again that the State of North Carolina has the lowest average industrial wage in the nation and the highest mortality rate in the nation and other problems. There are, indeed, two North Carolinas—one around Duke University and the Research Triangle Park.

What I am leading up to is: does it strike you as another bit of insanity that from the citizens of the State of North Carolina in the 1980s $275 million for mass transit has been collected and $14 million has been paid back? So from the State of North Carolina, with all of its problems, under existing formulas the Federal Government is taking—for every $1 that the Federal Government takes it sends back $0.05. The only way that we can benefit from any of this funding for mass transit is if the Federal Government recognizes something besides rail transportation and that sort of thing.

I suggest that the insanity that I am talking about is for that poor State—it is like breaking a man's leg and then laughing at him for limping.

Ms. NICHOLS. I think you are arguing for a change in government policy.

Mr. VALENTINE. I am.

Ms. NICHOLS. If that is all you are getting back——

Mr. VALENTINE. And I am arguing for sympathy. I want to yell out to anybody who can hear, my dearly beloved chairman and anybody else, that a State with the burdens it has—and when you talk about mass transit where you are building subway systems in the New Yorks and Philadelphias you are building it out of the little nickels and dimes of some of the poorest people in the Union. That just isn't fair. I just want you to agree with me.

Ms. NICHOLS. I agree with you it isn't fair, and I would certainly like to see government policy change so that that doesn't happen.

Mr. VALENTINE. Not only that, but part of what goes into the highway fund—we are still a donor State, Mr. Chairman.

Thank you, Mr. Chairman.

Mr. MINETA. All right. There are some questions that I would like to submit for the record from Mr. Shuster, and these will be transmitted to you. Please respond to these in writing to the committee. I would appreciate it.

[The questions and answers submitted by Mr. Mineta on behalf of Mr. Shuster follow:]

NATIONAL ASSOCIATION OF RAILROAD PASSENGERS

1. Your association strongly supports the concept of peak-hour pricing for use of the highways.

--Wouldn't this hit lower income workers the hardest, while higher-income motorists would simply tolerate the extra cost?

--How would you collect peak-hour fees without expensive or burdensome collection mechanisms?

2. You note in your testimony that European countries are linked together by a network of high speed trains. Does your association support increased research and funding for the promotion of magnetic levitation trains in the United States?

3. You cite the Portland, Oregon, light rail system as a cost-effective system that has exceeded ridership projections. According to UMTA's October 1989 study of Urban Rail Transit Projects, the Portland system has experienced 54 percent fewer weekday passengers than forecast and has incurred 55 percent more capital costs than forecast. Is this all the success Congress can expect?

Question 1: Peak Hour Pricing for the Use of Highways

We view peak-hour pricing for use of congested highways in urban areas as part of an overall policy aimed at more efficient use of our highways and dramatically improved public transportation and increased transit use. The Administration's new national transportation strategy states (p. 49): "It is Federal transportation policy to encourage peak-period or congestion pricing to ensure the most effective use of transportation facilities."

Lower income workers have been hurt the most by the overemphasis on auto commuting in U. S. transportation policy. A much higher proportion of lower-income families than other families have no car. Also, lower-income families who own one or more cars are forced to devote a larger share of their limited resources to transportation than would be the case with better public transit.

Any policy change would have negative short-term impacts on some people, but we think this obvious truth should not justify a status quo approach to transportation policy that cries out for change for reasons related to: environmental protection, energy security, safety, and the mobility of everyone. We say "everyone" because there will never be enough road space to reasonably accommodate everyone who would drive under today's cheap-gasoline, cheap-parking, limited-transit policies.

We would have no problem with special mechanisms, such as rebates, to protect the poor, at least during a transition period. As a practical political matter, we assume that any such pricing would be phased in very gently for all drivers.

The technology exists to charge peak-hour fees "without expensive or burdensome collection mechanisms." At the "Transpo" exhibit sponsored by the Department of Transportation in January in conjunction with the Transportation Research Board's annual meeting, 3M Corporation of Minnisota had an excellent exhibit of the electronic pricing equipment they have developed which will be tested at various locations in the country in the near future. Such equipment eliminates the need for toll booths and the long lines of idling cars and attendant pollution they often create.

When all costs are considered, the single-occupant peak-hour urban auto commuter is by far the most heavily subsidized transportation user in the world. It is time to address this subsidy.

Question 2: Research and funding of magnetic levitation trains

Our Association would support "increased research and funding for the promotion of magnetic levitation trains in the United States" if overall federal funding for intercity transportation in the U.S. sensibly included adequate capital investment for Amtrak and for partially state-funded rail projects. Given current federal priorities, however, in which investment in Amtrak is inadequate and federal aid for state rail projects nonexistent, we think increased funding for maglev research would reflect misdirected priorities.

High speed trains could quickly play a major role in expanding the intercity passenger train's already significant role in diverting traffic from congested airports and highways. Maglev technology, however, remains unproven in two key respects. The Japanese have yet to perfect and market the superconducting maglev, which U.S. maglev supporters think ultimately offers more advantages than the German electromagnetic approach. Perhaps more significantly, we don't know whether the ultimate incremental advantages of maglev over high speed rail will be enough to justify the incremental costs.

We do know that the country would benefit from immediate investments in high speed rail. We find it disgraceful, for example, that Chicago-St. Louis Amtrak trains today average 47 mph, while O'Hare Airport strains under congestion, talk is afoot of constructing a costly new Chicago-area airport and the federal government has no matching-fund programs to encourage states to improve the existing rail lines.

Oak Ridge National Laboratory's Transportation Energy Data Book indicates that airlines used 1.9 times more energy per passenger-mile than did Amtrak in 1987 (up from 1.8 in 1984). Imagine how much more impressive the passenger train would look if better track permitted running above 80 mph in more than 3 corridors!

If maglev systems are built in the next century, they would benefit from development patterns influenced by high speed trains Amtrak has today in a few places and could have tomorrow in many more places if federal transport policies were more balanced.

We are not opposed to the idea of spending on maglev; we merely suggest that a country that can afford to spend money on what may become significant in 21st-century transportation ought to do a much better job of looking out for the next few decades.

Question 3: Portland, OR light rail system's cost-effectiveness

Ridership and cost projections cited by UMTA for the Portland light rail system (LRT) that we are familiar with do an injustice to the system. UMTA-cited ridership projections are early projections, made back in 1978 and for the seventh year of year of operation. In 1978, population, employment and auto operating costs were all expected to increase significantly. Instead, a worldwide recession took place in the early-mid 1980's that had severe impacts in the Northwest, including Oregon. Multnomah County lost 25,000 jobs in the first half of the 1980's. As a result of the recession, all businesses, financial institutions and others revised and adjusted their plans and expectations based on a vastly changed economy.

In 1985, Portland revised its LRT ridership projections. The revised projections indicated approximately 17,500 riders for the first year of operation. In fact, Portland LRT's first year ridrship exceeded these projections, and averaged 19,900 riders/day. Total first year boarding rides was estimated at 3 million; actual first year ridership was 7.2 million. And, surpassing all expectations is the high weekend ridership, averaging 25,000-28,000/day, indicating people are using the LRT for non-work trips, such as shopping, visiting friends, etc.

UMTA-cited cost esimates that we are familiar with are also old estimates, based on a smaller project than was actually funded and constructed. If one looks at the full funding contract signed with UMTA, the Portland LRT came in under budget. The full funding contract was for $328 million and actual system cost, $321 million, with $214 million for the transit portion of the project and $107.3 million for the highway widening portion of the project. It is noteworthy that the 15 miles of light rail cost $214 million or $14 million/mile while the accompanying road-widening project cost $25 million/mile, a full 70% higher than the LRT per mile cost.

Operation of the LRT has also proven cost-effective. The revenue-cost ratio of the Portland LRT is significantly higher than the cost recovery of the regional buses. Portland's LRT recovers 65% of its costs from the farebox vs. 31% average for the regional bus system. In San Diego, a similar pattern is found: the San Diego trolley recovers over 90% of its costs from the farebox compared to 50% for the regional transit system as a whole.

We believe UMTA also does a disservice by failing to note the economic benefits that have accompanied the Portland LRT and similar systems in other cities. Over $500 million worth of development has taken place or is planned along the Portland LRT route. The American Public Transit Association estimates that every $100 million spent on rail transit generates more than $300 million in business revenues in the community--money which flows into the private sector as a result of the public investment.

Finally, we would also like to offer some general comments about new rail transit systems. These systems are built for the long-term. In future years their ridership will be increased by:

o Land-use development decisions, which take several years to have an impact. For example, although everyone today agrees that the San Diego system (which opened in 1981) is a model of efficiency, a 1984 report said "no major impact [by the San Diego trolley] on business activity or land development has been identified." Today, all types of development are springing up along the San Diego's existing and planned light rail lines.

o Changes in transportation policies needed for the reasons cited in our answer to your first question. For example, we think it is only a matter of time before the pro-auto-commuting bias in federal tax law is changed. Its existence and the need to change it is much more widely known today than a few years ago. Secretary Skinner seemed to endorse a change in his 1989 testimony before the House Appropriations Subcommittee on Transportation, when he said, in response to a question from Rep. Lawrence Coughlin (R-PA), "I do not understand why we should be subsidizing people to drive where there's mass transit."

We would like to submit for the record the following story by Don Phillips, which appeared in The Washington Post of April 1.

4/1/90

THE WASHINGTON POST

California Ready to Go on Rail Binge

Successful San Diego Trolley Helps Spark Move to Mass Transit

By Don Phillips
Washington Post Staff Writer

SAN DIEGO—In the late 1970s, the San Diego City Council voted to bar state construction of a trolley line into the city, saying it would rather reject the offer of 100 percent state funding than waste time on an unproven technology.

Today, barely a decade after the council narrowly changed its mind, the San Diego Trolley is the most financially successful transit system in the country.

With lines to the Mexican border and through bedroom communities to the east, the trolley recovers an astounding 92 percent of its costs from the farebox, and is likely to soon become the only transit system in North America to turn an operating profit.

Rep. Bill Lowery (R-Calif.), then one of four conservative GOP city council activists who took office in 1977, strongly opposed it, saying San Diego needed freeways rather than something that might not work. But within a short time, he changed his mind and battled with Republican administrations in Washington to get matching fund to expand the system.

"The projections proved to be very conservative," Lowery said. "It turned out great."

Lowery is one of millions of skeptical, freeway-loving Californians whose change of heart has led California to the edge of a rail binge.

The rail revival is one of the visible signs of a basic change in lifestyle being forced on Californians. Rising land prices have forced the ordinary Californian to live farther from work to afford a single-family home with a lawn. At the same time, the automobile, which once brought Californians the right to live far from work, has become a trap on crowded freeways. Daily commutes of 180 miles or more are becoming common.

"We're spilling people over into the San Joaquin Valley; it's madness, madness," said Paul Shepherd, a developer and consultant in Los Altos who has been active in transportation planning in San Mateo County south of San Francisco.

Light-rail systems—the modern name for trolleys—are being built or are expanding here and in Los Angeles, San Jose and Sacramento. Los Angeles is also building a subway system using trains similar to the successful Bay Area Rapid Transit System (BART) in San Francisco, with 150 miles planned of combined "heavy rail" and light rail.

And on June 5, the polls say Californians will approve bond issues totaling roughly $3 billion in the first year to expand trolley, mass transit and Amtrak service throughout the state, including new commuter trains on existing railroads running in three directions from Los Angeles.

If the bond issues pass, California will have voted to spend more for railroad expansion than the total amount the federal government has spent on the national Amtrak system over the last four years.

"We're going to see a major resurgence in rail, both intercity and urban transit," said California Transportation Director Robert Best.

Rolling along with the rail resurgence are hundreds of politicians, Democratic and Republican, including the candidates for governor. "Politicians are realizing trains are a

Board. As a longtime leader in the state Senate, Mills became the godfather of rail transit in California, pushing through legislation that placed a sales tax on gasoline to fund transit and allowed cities to levy a one-fourth of 1 cent sales tax for transit.

While in the Senate, Mills arranged state money for the San Diego Trolley.

Mills said the trolley's success can be attributed to its lean, low-cost operation and partly to the luck of location. Its first line connected San Diego with what city officials call the busiest border crossing in the world, San Ysidro-Tiajuana.

But he said its patronage is more than tourists and the poor. Many are white- and blue-collar commuters, and a survey showed that 40 percent of trolley riders own cars.

Mills said San Diego has discovered that people will leave their cars behind to ride trains, but not buses. "It's not logical, but that's the truth of it," he said. "It's appropriate for respectable people to get on trains, but it's not appropriate for respectable people to get on buses."

Sen. Pete Wilson (R-Calif.), then San Diego mayor, was a skeptic who now features the trolley in ads promoting his candidacy for governor.

"I had mixed feelings," Wilson said. "I thought it would be a wonderful thing if we could provide an alternative to cars and even buses. But I was deathly afraid of getting into something that would not be cost-effective."

Extensive studies persuaded him to support the project, Wilson said. "My father always told me it's much better to be lucky than smart," Wilson said. "We were trying to be smart, and we turned out to be both lucky and smart."

The Crestar 6 month IRA bonus rate

California Hopes to Build, Expand Rail Mass Transit

RAILS, From A25

fun political thing," said Daniel B. Lovegren of the California Association of Railroad Passengers.

Even longtime proponents are puzzled by the public's ready acceptance of rail transit. "I'm a little bit astonished," said Gerald H. Meral, executive director of the Planning and Conservation League, whose group gathered petitions to get one of the two bond issues on the ballot.

Some suggest that the auto-riding public simply wants to get more people off the freeway so they have more room to drive. But when a new train is inaugurated, Californians ride it. Letters to the Sacramento newspapers are complaining that the new light-rail system there is already overcrowded at rush hour, and the Los Angeles-San Diego route has become Amtrak's second busiest behind the Washington-New York corridor.

The Planning and Conservation League's $1.9 billion bond issue includes dozens of projects that would expand light rail systems and help initiate or expand commuter rail projects and Amtrak service. In addition to expanding service and buying new equipment, the bond issue contains money to design a "California car" for intercity service that could contain showers, telephones and facsimile machines.

A second mass transit bond issue—$1 billion per year for three years—was placed on the ballot by the state legislature. The legislature's issue may be in jeopardy because under California's convoluted ballot system, it is tied to a proposal to raise the state gasoline tax from 9 cents to 18 cents per gallon. Polls say the bond issue will pass, but the gas tax measure is in doubt.

Shepherd, the Los Altos consultant, is one of a growing number of transportation specialists warning that Californians must live closer together, somewhat like easterners, if they are to alleviate transportation problems.

"Californians like to live in single-family houses, and that's the problem," he said. "To make a [transit] system work, you've got to have density."

"California has been fortunate to have a lot of land to spill out on," said Rep. Vic Fazio (D-Calif.), who has been closely involved in promoting light rail in Sacramento and commuter service along the Interstate 80 corridor between Sacramento and Oakland. "We really have got to stop acting as if there is an unlimited supply of land."

Another important spur to rail development was the success of the state's pioneer rail systems. BART proved that people would ride a Metro-style system in a major western city, while the surge in ridership on Amtrak routes and on the state's one current commuter train—the San Francisco-San Jose CalTrain—demonstrated a desire for passenger train service.

But it was the San Diego Trolley that proved that small and medium-size cities could have a transit system at a fraction of the cost of heavy rail. Light-rail systems often share streets with cars, and usually don't need tunnels and overpasses, making construction comparatively cheap. The equipment is common throughout Europe, allowing purchase of proven, easy-to-maintain trolley cars right off European assembly lines.

It also proved that a system could be built without the problems that plagued a system such as BART that attempted to be on the cutting edge of technology.

People flocked to the trolley in such numbers that plans are under way to expand it in a spider-web of more than 100 miles of electric-powered lines throughout San Diego County. Its daily ridership of 30,000—on trains that vary from two to four cars—is far ahead of projections.

"The success has surprised everybody; otherwise, it would have been a $115 million albatross around my neck," said James R. Mills, head of the San Diego Metropolitan Transit Development

DELAWARE VALLEY CITIZENS' COUNCIL
FOR CLEAN AIR

1. You argue that greatly increased funding of transit would help this country combat its air pollution problem. Several cities with serious air pollution problems already have extensive transit systems. Why hasn't transit been the answer there?

2. One of the major criticisms of rail transit systems is that they simply don't take commuters where they need to go. A huge number of daily commuter trips are now suburb to suburb rather than suburb to inner city. How can transit address the new patterns of travel that have emerged?

3. Certainly pollution is a problem for all Americans. Transit facilities, however, are chiefly systems that benefit metropolitan areas. If federal tax dollars are used to build and support transit facilities, aren't millions of rural and smaller urban taxpayers paying for systems they will never use?

SUBCOMMITTEE ON SURFACE TRANSPORTATION
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
MARCH 20, 1990

RESPONSE TO INDIVIDUAL QUESTIONS

1. Philadelphia is one of our country's most severly polluted cities despite the existence of the Southeastern Public Transit Authority (SEPTA), the City's public transit system. Due to consistent, long term cuts in subsidies to SEPTA from all levels of government, SEPTA service has been and will continue to be unable to meet the current and growing needs of the region. As a result, the Philadelphia region is choking in traffic congestion. All projections indicate that the congestion problem will wosen by between 3% and 6% per year into the foreseeable future.

2. If transit systems had the capital to invest in a suburb to suburb commuter system, the plans that many systems now have on the drawing boards could become reality. Reverse commuting, another nontraditional pattern, accounts for 60% of the ridership on many of SEPTA's lines.

Several Chambers of Commerce in the Philadelphia region have helped subsidize new suburban lines in order to alleviate the chronic labor shortage problem in the suburbs. As highway building is more land intensive, more energy intensive and environmentally destructive in the long-run than mass transit, the more prudent solution to alleviating the suburb to suburb commuter problem (which eventually will have to be solved) is mass transit.

3. Mass transit inures to everyone's benefit. The ozone precursors that come out of the tailpipes of Washington's cars make rural, intensively agricultural Lancaster County, Pa. a non-attainment area. Nationally, transient air pollutants cost the economy between $3 and $5 billion in crop losses, to say nothing of the damage those pollutants do to our forests and bodies of water. There are countless environmental, national security (through reduced use of

CHRISTMAS SEALS HELP FIGHT AIR POLLUTION

RECYCLED PAPER

oil, most of which is imported) and public health benefits to be realized from reducing vehicle miles travelled. Mass transit is the most practical way to achieve large reductions.

Pennsylvania taxpayers have helped pay dearly for the vast system of our nation's western dams. They have helped pay for the interstsate highway system which benefits some states more than others. The Philadelphia region, which makes up one-third of the economic base of Pennsylvania, has paid dearly for the vast highway system that reaches every rural area in the Commonwealth.

Respectfully submitted,

Sara R. Nichols
Staff Attorney
Clean Air Council

Mr. MINETA. Thank you very, very much Ms. Nichols and Ms. Parcells for your testimony here. During the next 18 months we are going to be going through an arm wrestling on a lot of these things and we, frankly, would like your help on these issues as we try to come together to terms on some good legislation.

Thank you very much.

Ms. NICHOLS. Thank you.

Ms. PARCELLS. Thank you very much.

Mr. MINETA. Thank you.

[Ms. Nichols' prepared statement appears on page 1150.]

[Ms. Parcells' prepared statement appears on page 1173.]

Mr. MINETA. At this time I would like to call on David D. King, the Director of the Public Transportation Division of the North Carolina Department of Transportation, and I would like to call on my very fine colleague, Mr. Valentine, from North Carolina.

Mr. VALENTINE. Thank you, Mr. Chairman. We have saved the best for the last.

I commend the testimony of David King to my colleagues on the subcommittee and to those who will read his testimony. It is late in the day and we don't have the attendance we would like, but I would like to add my word of personal welcome to you, Mr. King, and a word of thanks for your appearance here today.

TESTIMONY OF DAVID D. KING, DIRECTOR, PUBLIC TRANSPORTATION DIVISION, NORTH CAROLINA DEPARTMENT OF TRANSPORTATION

Mr. KING. Thank you, sir.

Mr. Chairman and Mr. Valentine, I very much appreciate the opportunity to speak with you. I will be brief for several reasons. One is that you have suffered long today in the listening mode and I know that is hard work. Secondly, I have got a plane to catch, so I will be hurrying through what I have to say.

I have 12 points in the written material which I have presented to you. I will paraphrase that and be very brief on the points that have been covered already by other speakers.

Before I start, though, I would like to make a couple of points that go back to some questions that Mr. Laughlin was asking this morning.

One of the unfortunate burdens of public transportation in this country is having to live up to the term "mass transit." And for those States like North Carolina that have as its largest city the city of Charlotte, which has 400,000 people, the kinds of transit systems that work quite well in very dense cities do not make any sense at all right now. In going back to your discussion with the previous two panelists, it will be a while before they do.

The analogy has been made of a large carrier or battleship, and you turn the rudder a degree or two and that battleship begins to turn a little bit, and it takes years and years before land use patterns and transportation systems that have been set in place over the years, going back a century or more, are altered. So I think that is another way to look at your question, Mr. Chairman, of whether we tear down those 4.2 dwelling units. Probably not, but

you have got to start somewhere and it takes years and years to make that transition.

So my point is that we always are battling the term "mass transit." We call our activities "public transportation." Quite frankly, those activities that are not related to congestion relief are the ones that are growing most explosively in North Carolina and in a lot of rural and small urban America right now.

You heard Ms. Flinchbaugh earlier today and you heard Mr. Louwerse from Pennsylvania making some of these points this morning. I would echo a lot of that. The demand for the human service transportation business, which serves people who do not, in a lot of cases, have alternatives to the private automobile, is exploding; whereas our fixed-route urban transit systems are experiencing modest growth in most cases, at best.

I would propose that as part of the reauthorization discussion that you also discuss renaming the Urban Mass Transportation Administration to something that describes what they do or what we do in North Carolina more accurately than the Urban Mass Transit Administration.

My twelve points:

One, whatever you do, make it predictable and consistent. Whether it is a four- or five-year authorization program, local governments usually have a planning horizon of four or five years. They need to know what the Federal partner is going to do. Once they know that with certainty they can make their plans accordingly.

Two, equity of distribution. I think Mr. Valentine made my point for me. We have worked within AASHTO to produce a consensus on the equity question with regard to the mass transit account of the Highway Trust Fund. As Mr. Valentine noted, we have historically gotten a very, very meager share of what we send to Washington for the discretionary capital program, and the AASHTO position calls for distributing any appropriations made over current levels based on a formula which would allow donor States like North Carolina to get a much fairer share of what we are sending to Washington. I think that point has been made by a number of people today.

The third point is flexibility. After what I have heard about the word flexibility today it seems like it must be the 11th commandment. Maybe Moses dropped that particular tablet when he was heading down the mountain. But in our case—you mentioned flexibility is in the eye of the beholder. In our case I think I would characterize it as cross-categorical flexibility.

The resources that we get from the Federal level, no matter what you do, are going to be inadequate to solve the problem. We would recommend that you not try to put them in narrow categories; rather, give us and the other 49 States and the localities the resources and let those decisions be made at the local and the State level.

In response to your question of a couple of people about MPOs, my response, based on North Carolina, is that MPOs have a way to go before they are capable of making good judgments, but that they have got to grow to the responsibility that you might give them. If the responsibility is handed out, I think they will rise to the occa-

sion. But it will take some growth, I think, in their decision making and wisdom before they are capable of doing what you would like for them to do.

Parenthetically, let me say that I am proud that APTA has made the transition over the last couple of years. In preparing for the reauthorization process I think they have grown as an organization to accept a much broader definition of public transportation. You heard them today talking about ride sharing and some of the measures that make a lot more sense in very low-density areas like North Carolina where we don't have the kinds of densities that support heavy rail or even light rail services and don't expect to for 10 or 20 years.

Four, inter-modalism. I think you need to take a look at your Department of Transportation and its coordination and inter-departmental or inter-agency communications. I don't believe the Urban Mass Transportation Administration talks with the Federal Highway Administration as much as it should to coordinate projects such as HOV lanes in the right kinds of ways. I think there are an awful lot of opportunities for better transportation thinking at the Federal level that tends to translate to the State level, as well, since a lot of State DOTs tend to reflect the Federal leadership that they see at the USDOT. And when they see transit and highway folks not talking at the Federal level, they tend to not talk as much as they should at the State level and the local level, as well.

Five, rural mobility. This point has been made several times today. Again, 2.93 percent of the total general funds that are supplied for transit assistance go to rural areas. In North Carolina approximately 50 percent of our population is rural. Those folks tend to be even more isolated than folks in urban areas. If you do not have an automobile and live in rural Edgeconbe County it is much more difficult to get to the doctor in the county seat than it is if you live in Rocky Mount. So keep that in mind.

I hope that you will have an opportunity to address that disparity between rural isolation and the way the current authorization distributes money between rural and small urban areas, on the one hand, through the section 18 program, and urbanized areas, on the other hand, through the section 9 program.

Six, human service coordination. This is something nobody has touched on today so I will spend a little bit longer on it.

In this room in 1985 under Mr. Oberstar an investigation in the Oversight Subcommittee meeting dealt with this subject. One of the outgrowths of that discussion was a directive to USDA and HHS—Health and Human Services—to step up their efforts to coordinate the massive funding provided by Health and Human Services for transportation purposes.

As an observer from one State capital, I can tell you that I think their progress has been agonizingly slow in that respect. HHS spends over $1 billion a year—I think that is a conservative number—on transportation services, what we call human service transportation, through their aging program, through Headstart, developmental disabilities, mental health, and all sorts of programmatic areas, seldom labeled as a transportation budget line item but quite often going to get clients to services.

I do not think that they have done nearly all they could to make those expenditures cost-effective, to avoid and eliminate duplication of service, redundancy, and so forth. So I hope that in the reauthorization process you will address that question.

I point out in point seven some of the factors that—and these are just three of quite a long list of factors—are tending to increase the demand for human service transportation.

One is the aging of the population, a fact that is well documented. We have a pilot program in North Carolina that is allowing driver license examiners, when they have to make that difficult call when an elderly individual has to forfeit their license because they no longer are capable of operating safely on the highways, of trying to match that individual who is losing a valued piece of independence with a public transportation service in their county. That is something that will continue to happen. As people live longer they will reach that point where they can no longer safely operate an automobile and that will increase demand for public transportation services.

A second item is increased attention to individuals with developmental disabilities. Our State has just issued a report calling for much greater attention to transportation for those individuals.

Third is the jobs component of the recently-passed Family Support Act which helps individuals on welfare make the transition to a job and provides them with some transportation assistance while they are trying to make that connection.

All of those things and many more are adding to the demand for public transportation in rural and small urban areas, or the kind of public transportation we refer to as "human service transportation."

Number eight, the Americans with Disabilities Act. That has been discussed widely, but let me point out one thing that I haven't heard discussed enough, and that is how we are going to pay for it. Particularly of concern to me is the increased cost for capital equipment for para-transit services that might be required if each vehicle is required to have a wheelchair lift. Most of our human service transportation operators use the 15-passenger van as the workhorse of their fleet. If you add a lift to a van it increases the cost of that van by over 40 percent. If you add a lift to a 35- or 40-passenger bus in an urban environment it increases the cost of that bus by 7 or 8 percent. So the impact on rural and small urban capital requirements is much greater due to ADA than it is in urbanized areas. I hope that point is considered.

Regulatory reform, which is another point, has been beaten to death, but let me cite one example that would differ with one of your prior speakers.

We have a park and ride lot capital application into the Urban Mass Transit Administration that has been held up for six months for a 13(c) sign off. We are unable to see how there is any possibility of injuring employees by building a park and ride lot that would serve both transit and ride sharing, yet that grant has been held up for six months awaiting a 13(c) certification. So all is not rosy in that camp.

I think the problems are more likely to be found in new situations. One of the gentlemen earlier said that when it is a matter of

going back and looking at how an old labor agreement fits in a current situation, those things do tend to flow rather easily and that is working out well. But when situations are novel, then it is a much, much more difficult situation.

Ten, parking. I think one of the ladies that spoke just before me made this point, but I think this is an extremely important point. We tax transit passes over $15 as an employee benefit. Free or under-priced parking provided by an employer is not taxed as an employee benefit at any level. That sends exactly the wrong signal to every American who is making a decision about how to commute to work. If nothing else is done in the reauthorization process, I hope that problem can be addressed. That is badly in need of fixing.

Eleven, Amtrak. A lot of States around the country are interested in working with Amtrak on some service. We are finding in North Carolina and in other areas of the country that Amtrak is so starved for capital equipment that they cannot respond to us. As long as we have a national railroad passenger monopoly and that is the only place we can turn for service, it makes no sense that we cannot work with that organization because they haven't had enough funding to buy sufficient capital to be able to respond to State needs when we are willing to step forward with money to participate with them on some inner city service. I hope that can be dealt with.

And then finally another subject that nobody has broached—at least if I have been paying attention today—is research. The Transportation Research Board produced a study about two years ago that called for some problem-solving, nitty-gritty research to be conducted in the public transportation arena using a set-aside from the formula program—I think the numbers were .5 percent or 1 percent of the section 9 and the section 18 programs—providing something under $10 million a year, or certainly under $15 million a year, for operator-directed problem solving research. I hope that some means of addressing that research need can be found as you deliberate the reauthorization process.

Mr. Chairman, that is all I need to say. I really do appreciate this opportunity to be heard and would be happy to respond to any questions.

Mr. MINETA. Thank you very much, Mr. King.

Let me ask first of all how you would incorporate increased flexibility into mass transit/public transportation funding so that communities could make use of ride sharing and demand management strategies which are not related to capital grants?

Mr. KING. The categorical programs—16(b)(2), which is elderly and handicapped; 18, which is rural and small urban; 9, which is urbanized—all have different amounts of flexibility within them. Those are artificial distinctions when you have still got less money, if you go back to my original point, than what you need.

The point about increased flexibility in the discretionary program, section 3, is that bus replacement, new starts of heavy rail systems, and rail modernization really don't get to ride sharing and demand management strategies such as some of those that are part of the LA Basin air improvement strategy. Those are not the kinds

38-253 O—91——36

of projects that UMTA places a high priority on in using section 3 resources.

We think that the list of approved and smiled-upon projects that are capable of being funded out of section 3 ought to be much, much broader than what has historically been the case to include capital for rural and small urban and human service applications. That is part of the AASHTO position, by the way.

Mr. MINETA. Mr. King, let me ask if you would give us some specific examples of regulatory reform which you feel would improve the delivery of public transportation services?

Mr. KING. I think this rethinking of the entire program that you will be going through offers an excellent opportunity to look at a number of regulatory issues that have been hung on the transit programs through the years, each sane and making plenty of sense on its own, but when added together and not examined afresh tend to add a burden that is becoming fairly monstrous.

You have got Buy America, you have got DBE, you have got drug testing, you have got title 6. I am only scratching the surface.

I suspect that if you got a group of operators and some Federal folks together in a room and locked them up for two days they could come up with some excellent ways to improve the paperwork, to combine requirements, to update antiquated regulatory language, and all of that would add up to savings which might reduce the need for dollars.

Mr. MINETA. Very well. Thank you very much.

Mr. Valentine.

Mr. VALENTINE. Thank you, Mr. Chairman.

I would like to ask you, Mr. King, a question or two about a subject that we have already been into. I ask these questions so as to get this matter in the record in a little bit different form from my rhetoric.

Approximately how much money has North Carolina contributed to the mass transit account since the inception of the program in the early 1980s?

Mr. KING. One penny in North Carolina today raises about $39 million—just short of $40 million. I estimate that over the life of the program North Carolina has collected about $275 million for the mass transit account.

Mr. VALENTINE. And how much has the State of North Carolina received from programs funded by the mass transit account in that same period of time?

Mr. KING. About $14 million, most of it in the form of the section 16(b)(2) program.

Mr. VALENTINE. And so the rate of return would be about 5 percent?

Mr. KING. Yes, sir.

Mr. VALENTINE. For every $1 that the State of North Carolina sends to the Federal treasury they get $0.05 back?

Mr. KING. That is correct.

Mr. VALENTINE. I understand that section 16(b)(2) program that funds small buses and vans for elderly and handicapped services is funded out of the mass transit revenues. What is North Carolina's share of this national program?

Mr. KING. That is a $35 million national program that comes off the top of the mass transit account. North Carolina gets about $805,000 a year. That is 80 percent of total project cost, with 10 percent supplied in our case by the State and 10 percent by the private, nonprofit agency that receives the money. That will fund about a $1 million program.

We have needs on an annual basis to replace vehicles that are in service in North Carolina in human service transportation functions that are in the $5.5 million to $6 million range. So we can meet about one-sixth of that need for very basic life-sustaining, gut-level services, and yet we only get $805,000. So that is one of the sources of our frustration about the mass transit account. If we had even a 50 percent minimum allocation out of that program, we would be able to meet those kinds of needs and do some other things that are sorely needed in our State.

Mr. VALENTINE. I have one final question. Does North Carolina also receive less than it sends in to the Federal Government in the highway program?

Mr. KING. Yes, sir. We are one of those States that gets less than what we send from the highway fund, as well.

Mr. VALENTINE. And I think there has been maybe one demonstration projection that State?

Mr. KING. The city of Charlotte has got a preliminary commitment for a $12 million HOV lane. They have received about $1 million for design, and that's it.

Mr. VALENTINE. Thank you, sir.

Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Valentine.

Mr. King, as we are going over some of those figures right now, recognizing that this is a snapshot in time as it relates to funding—for instance, under UMTA—I suppose if we were to take a look at the interstate program historically and look at the historical experience of North Carolina under the interstate program it may be weighted favorably in the case of North Carolina, is it not?

Mr. KING. I have heard this discussed. Since this was done in the 1950s, it was before my time. But apparently North Carolina was asleep at the switch when it came to designing the interstate program, so we have been in a donor status in the highway program for years and years.

Mr. MINETA. And the light switch has now been turned on?

Mr. KING. I certainly hope so.

Mr. MINETA. Again, thank you very much, Mr. King, for your contribution and testimony here today.

Mr. KING. Thank you.

[Mr. King's prepared statement appears on page 1139.]

Mr. MINETA. Now we would like to call on Doctor John W. Holtzclaw, Urban Sociologist, Engineer, Physicist, representing the Sierra Club of California.

Doctor Holtzclaw, your testimony will be made a part of the record. Please proceed in your own fashion, sir.

TESTIMONY OF JOHN W. HOLTZCLAW, URBAN SOCIOLOGIST, ENGINEER, PHYSICIST, REPRESENTING SIERRA CLUB OF CALIFORNIA

Mr. HOLTZCLAW. Chairman Mineta and members of the committee, being last I guess I have to be provocative to keep you awake, but not too provocative. I wanted to leave here by 4:30 to make my train. Obviously I am not going to make that, but I might be able to run for it anyhow.

I want to thank the committee for seriously considering alternatives to a new urban/suburban highway system which, if it were authorized, would be completed around the year 2020 when we are running out of petroleum, which would be too ironic.

Massive highway construction will not relieve the congestion problem that we have nationwide. As Newman, Kenworthy & Lyons showed, it will just encourage people to move further away, drive further, increase congestion, increase fuel consumption, increase air pollution, and, ironically enough, by increasing trip length actually increase the time people spend in commuting and driving.

But highways also have another effect, and that is: as they encourage sprawl growth they encourage more consumption of materials and lands.

Phillips & Gnaizda studied two developments in California: one on the slopes of Nobb Hill, an apartment house in a very dense area of San Francisco and with very good access to downtown; the other a very state-of-the-art energy-conserving development of single-family dwellings in Davis, California.

They found that the people in Davis, California, drove four times as much as the people living in the apartments in San Francisco, they used 40 times as much land, 15 times as much roadway, 50 times as much lumber, 5 times as much utility pipe, and much more water and fuel. This is typical.

I have been studying the amount people drive as a function of where they live in San Francisco Bay Area. One of the conclusions of my study is that for every mile that people ride on transit they don't drive ten miles. That is because transit encourages much denser growth, encourages the destinations—whether they be jobs or whether they be restaurants or markets—to be much closer so that the trips are much shorter so that one mile on transit on the average displaces ten miles of driving. In New York City, for instance, people drive one-fourth as much as the average American does.

Transit consumes only one-fifth to one-third as much fuel per passenger mile. Rapid transit can carry 24 times as many people per lane as highways; buses, six times as many people as autos.

Another conclusion from this study in the Bay Area is that every time you double the density—residential density, along with local services density—you decrease the amount of mileage people drive by 25 to 30 percent. So if this city, Washington, or if San Jose were to double in population and it were all to occur by in-fill development rather than by continued sprawl, instead of the mileage that people drive doubling or more than doubling it would only go up 40 to 50 percent. So it is a real way to cut down our auto mileage.

This happens naturally. It doesn't require transportation control measures or other restrictions on the automobile which also help, but it occurs naturally just because the area is more convenient.

Other impacts of sprawling congestion are air pollution and loss of natural areas. As the Lung Association has pointed out, we spend annually in work time loss and in medical costs due to air pollution $40 billion to $50 billion in this country. The Harvard School of Public Health estimated that something like 53,000 people die every year from air pollution.

The USGS estimated that in the San Francisco Bay Area we have lost 94 percent of our wetlands to development fed by continued highway growth.

How have we gotten ourselves into this condition? We have spent ourselves into it and we have zoned ourselves into it. We have spent on highways eight times as much Federal dollars as we have spent on transit.

The Sierra Club urges you to do a couple of things. One, in order—as you have pointed out, how are we going to reverse this? How are we going to change the direction in which we have already been going?

One thing we have to do is educate ourselves and educate the public—get more information on the impacts of our highway dollar and our transit dollar and the subsidies to motor vehicles. So I urge you to sponsor research into the impacts of more highway dollars and more dollars on transit along with zoning changes, in-fill development, to look at things like sprawl and traffic congestion, loss of forests and agricultural lands, consumption of energy and materials, in construction and energy and water in the new developments, production of air and water pollution, and the condition of the inner cities.

I also urge you to evaluate the subsidies—support to fund the evaluation of the subsidies to motor vehicles. Subsidies? But we have been told over and over again the motor vehicle pays its way.

Stan Hart studied Pasadena, California's, and the Los Angeles County subsidies to the motorist in Pasadena just looking at the cost of designing and constructing highways and ambulance, fire, and police protection for motorists. He estimated that the city and the county subsidize motorists $0.40 to $0.50 per gallon of gas. That is half of what we pay for our gas. And that doesn't include a lot of other subsidies, some of which have already been talked about—free parking at work, at shopping centers, and other places; property taxes not paid by the freeways.

Freeways, when they go through our cities, bulldoze housing and bulldoze businesses that pay property taxes. CalTrans doesn't pay those property taxes, and the other State highway departments don't pay those property taxes to the local government. So the property taxpayers otherwise have to pay it.

Smog-related health and work loss costs, damage to crops and structures due to smog; time loss to traffic congestion. All of those are subsidies of the automobile.

We urge that all of those be studied, that we have a better feeling for them.

And then we urge you to adopt a transportation bill that includes full cost pricing of motor vehicles—smog fees, gas taxes,

auto sales taxes, licensing and registration fees, toll roads, and elimination of subsidized parking—to recoup the full cost to society of the motor vehicle, and then use that money to improve transit systems and to reduce property and sales taxes that are now providing the subsidies to the cars.

So those are mostly fairly regressive taxes, so this kind of system would be more progressive.

The Bay Area Environmental Forum, which is an organization of the Bay Area Council that I'm sure you know spur the heads of the two major universities in the Bay Area and political leaders in the Bay Area, have supported much of this program—increased bridge tolls, smog fees, reduction or elimination of free parking at work, or at least subsidies for people who walk or take transit equal to the parking subsidies. So it is really not that outlandish a proposal. At least we have convinced the political leaders and the business leaders in the Bay Area that it is not that outlandish.

And, finally, use these taxes to build and operate adequate transit systems—especially rail. I would urge that these funds be tied to land planning changes, zoning changes to require that they allow three- and four-story apartment houses with commercial development on the first floor—the kind of development that isn't too frightening to local governments, but would help to build up the density that would allow people to walk and take transit much more efficiently.

I thank the committee.

Mr. MINETA. Doctor Holtzclaw, thank you very much.

Let me ask about this last point about the full-cost pricing of auto use. You are saying these are proposals. You are not saying that they have been adopted in the Bay Area in any form, have they?

Mr. HOLTZCLAW. We had a press conference about a month ago, and the Bay Area Environmental Forum proposed these. Some of them require State legislative changes; some of them perhaps require Federal changes. Certainly they require regional and local changes in legislation.

Mr. MINETA. I got the impression that some were already adopted in place.

Mr. HOLTZCLAW. And they did support SCA1 as the specific gas tax increase.

Mr. MINETA. And I assume because the SCA1 includes the congestion management plan to try and leverage on what gets done State-wide?

Mr. HOLTZCLAW. Yes.

Mr. MINETA. Now, this issue where you say the city and county subsidize the motorist in terms of $0.40 to $0.50 per gallon of gas because there is a loss of property tax because of the road that is there, what would be the comparable figure for mass transit in terms of loss of the property? Let's say if we were to take the BART system, since that is off the property rolls what would be the equivalent? What would be that as compared to——

Mr. HOLTZCLAW. At least when BART was built—as you know, through downtown San Francisco it is underground. Through most of the rest of the area it has a very narrow right-of way. A highway or freeway when it goes through bulldozes a block-wide swath

of land. And then when you get to the cloverleaves you get six or ten square blocks of land that are lost. Even the Central Freeway in San Francisco took out a lot of buildings. BART didn't take out that many buildings. Even when it went out to Walnut Creek it went down the freeway center right-of-way, which is not the best place for a transit system because it doesn't encourage people to walk a lot. The station is surrounded by parking lot instead of business and housing. But hopefully that can be improved in the future.

You asked earlier about the fact that we already have low density. I lived in San Jose in the mid-1960s, and it is very true——

Mr. MINETA. The only thing I am going to say on that is the fact that I also, when I was mayor, slowed the growth down and increased density. I am familiar with this.

Mr. HOLTZCLAW. Great.

Mr. MINETA. It is nothing new for me. I have done it.

Mr. HOLTZCLAW. Yes.

Mr. MINETA. But what I don't like is to be able to have people come in and just make general statements about do this or do that when, frankly, I think it is tougher than statements just to be made before committees of Congress. That is all I am saying.

Mr. HOLTZCLAW. It is not easy. One of the reasons——

Mr. MINETA. You are darn right it is not easy.

Mr. HOLTZCLAW [continuing]. I proposed a lot of additional studies is because I think the public, when they understand the impacts of the way we are going—as one of the previous speakers said, the Chinese proverb, "Unless we change the way we are going we are going to end up where we are headed." We have spent 40 years building highways and encouraging sprawl. We are not going to change that to get a dense situation in five years. It is going to take another 40 years, but we are running out of petroleum as well as running out of breathable air and so on. If we don't start now, if we wait and build another 20 years of highways, we will be 20 years further down the road in the wrong direction.

And I am also encouraging tying the monies that go to the local government to requirements for land use changes which allow three- and four-story apartment houses to be built along major transit corridors and around transit stations with commercial below it. That is no so frightening to people. The three- and four-story walk-up is not as frightening as Manhattanization, but that is a step in the right direction.

Mr. MINETA. But I bet for the community that has that seven dwelling units to the acre, walking up three stories is the Manhattanization of their community. They are used to that one-level, spread-out sprawl.

If I were to go into Los Altos Hills and say we are going to come in with three-story, beautiful condominiums, townhouses, or whatever, to them that is Manhattanization of Los Altos Hills.

Mr. HOLTZCLAW. Maybe we will have to write off Los Altos Hills, but we certainly have a lot of other transportation corridors in Santa Clara County and San Mateo County and other places that have parking lots, that have older buildings that are being replaced that would be prime locations for three- and four-story apartment houses that would give the density—it would help to build the den-

sity that would make transit service worthwhile but, more importantly, would allow people to walk to a lot of their destinations because the restaurants and the markets and so on are much closer.

Mr. MINETA. How do we do that without preempting traditional local and State land use planning roles? Or are we saying that is tradition, that is old hat, toss it out because it ought to be preempted?

Mr. HOLTZCLAW. Well, I would say that. But I would also say that a lot of Federal legislation has strings attached to it and some of the strings improve things locally and some make it worse. I would propose these are strings which would help improve conditions locally.

We have also, with the Federally-supported housing loan program, encouraged suburban sprawl. We have encouraged low-density development. That needs to be changed, too.

As you have pointed out this morning, the Clean Air Act or the clean air requirements are going to be a major engine for change. What I am suggesting is that part of what has to be changed is the way we get around. I am suggesting that you tie the Surface Transportation Act to improving air quality, to improving our urban efficiency and helping the Clean Air Act along.

Mr. MINETA. Thank you.

Mr. Shuster.

Mr. SHUSTER. Excellent testimony, Doctor Holtzclaw.

Mr. HOLTZCLAW. Thank you.

Mr. SHUSTER. I have no questions, Mr. Chairman.

Mr. MINETA. Well, I am quite sure that in the next 18 or 19 months as we are trying to put this thing together, Doctor, you and I are going to have a lot more conversations. I would like to do that because there is a need for a transportation policy from a Federal perspective. I think we have got to be able to respect local and State laws and processes in that as we try to build that Federal transportation policy. So I would like to stay in touch with you on terms of how we might be doing the implementing of some of these things.

Mr. HOLTZCLAW. My pleasure.

Mr. MINETA. Thank you very, very much.

[Mr. Holtzclaw's prepared statement appears on page 1125.]

Mr. MINETA. There not being any further business before the subcommittee, we stand adjourned until Thursday at 10:00 a.m. in room 2253.

Thank you.

[Whereupon, at 4:45 p.m., the subcommittee was recessed, scheduled to reconvene at 10:00 a.m. on Thursday, March 22, 1990, in room 2253.]

PREPARED STATEMENTS OF WITNESSES

Statement of Patricia Flinchbaugh, CTAA

Chairman Mineta and Members of the Committee, my name is Patricia Flinchbaugh and I am Executive Director of Community Transit, Inc., which provides both regular and specialized public transit service in and around the City of York, Pennsylvania. I am appearing on behalf of the Community Transportation Association of America (CTAA), on whose Board of Directors I serve.

Our Association represents rural, small urban and specialized transportation providers and their riders. We have a membership of more than 400 agencies located in 47 of the 50 states. The following excerpt from CTAA's Mission Statement makes clear our organization's interest in national transportation policy and in the Urban Mass Transportation Act, the reauthorization of which you have under consideration.

> "We advocate for, promote, and support the development, operation and enhancement of safe and effective community transportation for all people in rural and urban areas. We will work to strengthen the voices of our constituency by building effective partnerships and alliances between providers and users of community transportation services at all levels."
>
> "And, finally, we will mobilize our collective resources in order to educate the public about the importance of individual mobility and community transportation, and will work to establish public policies that recognize individual mobility as a basic human right."

Stated briefly, CTAA's policy goal is the following: "To establish and maintain a network of public and private transportation resources in the United States to assure mobility for the well-being of the country, its citizens and their communities." The Urban Mass Transportation Act and its programs are and will continue to be crucial to our efforts to achieve that objective.

Restoring and Restructuring Federal Transit Assistance

Our recommendations for the reauthorization of the Act revolve around three basic needs that we see: Restoration, Stabilization and Restructuring.

RESTORATION

However one may feel about the specific recommendations of the National Transportation Policy Statement recently released by Transportation Secretary Skinner, its statement of the importance of the issue can not be challenged:

> "The transportation infrastructure is vital to the Nation's economy, and it must serve the needs of all Americans, including the young and old, minorities, disadvantaged and disabled individuals, and people living in urban and rural communities."

The statement goes on to warn of "increasing signs . . . that the system is beginning to break down." This should not be surprising since federal investment has eroded steadily over the past decade, not only relative to the economy, but even in absolute (constant) dollars. To put it in specific program terms, the Section 18 program of assistance to rural communities was funded at $85 million in Fiscal Year 1980. Had funding merely kept up with inflation in the decade since, funding for FY'90 would have to be $132 million. Instead, it is less than half that amount.

As economist after economist points out, we as a society and an economy, pay a heavy price for those cuts in public investment. Our productivity has gone steadily down and our economic competitiveness has come into real jeopardy. Our nation's mobility has always been a critical element in our economic productivity. Ready accessibility to labor and other productive resources and to markets is essential to economic growth and development. Optimum use of mobility resources is necessary to their effectiveness and to the productivity which they enhance. It is also a key to cleaner air, reduced congestion and greater convenience. At the personal level, mobility is an essential link to jobs, to schools and training, to health care, to shopping, to friends and extended family, to the rest of society.

In short, the first need to which a reauthorized Urban Mass Transportation Act must respond is the need to restore federal investment in public transit to a level commensurate with the human, social and economic importance of those services. CTAA agrees with APTA and others in the transit field that such a level of transit investment would be at least $6.5 billion annually.

STABILIZATION

Transit investment also needs the underpinning of a stable and dedicated source of funding -- one that not only ends the downward trend line of the past decade, but also ends the roller-coaster oscillations around that trend line that have afflicted transit programs. To again take the Sec. 18 program as the example, over the years FY'82 through FY'88, this was the sequence of year-to-year changes in funding: down 6 percent, up 33 percent, down 23 percent, up 3 percent, down 16 percent, up 24 percent, down 14 percent. The 1982 reauthorization legislation took a major step toward meeting transit's need for a stable and reliable funding source by creating the Mass Transit Account. But, this has only helped about one-third of the programs. Stabilization remains a basic need for the rest of transit.

Given the importance of transit to sound environmental policy as well as its key role in any balanced network of transportation resources, an increased motor fuel tax is an appropriate way to provide the stable and dedicated source of funding that transit needs and should have. An increased 5 cents per gallon ear-marked for transit would be sufficient to provide the minimum funding level we are recommending.

RESTRUCTURING

In our view, restoring and stabilizing federal transit investment are essential but not sufficient to respond to the needs which a reauthorization bill should meet. Changed and changing demographic, social and economic patterns as well as a large backlog of unmet needs require that federal transit assistance be restructured as well -- to assure that the mix and balance of programs and support match appropriately with the mix and balance of transit needs. It is in this area of identifying priorities and restructuring transit policy and programs to reflect them that CTAA feels we have some particularly important things to say and about which we feel the most strongly.

Serving the Transit Dependent: In a time of limited resources, it is our view that a first priority of transit policy must be to meet the needs of the transit dependent, those who lack adequate access to alternative means of mobility. Census statistics suggest that as many as 84 million Americans, or roughly one-third of the population, have at best very limited access to a private automobile and are therefore largely dependent on public transit for the mobility which is so central to our economic health and their personal quality of life. It needs to be stressed that fully one-third of the transit dependent live outside of urbanized areas.

It also needs to be stressed that, using assumptions which we feel are reasonable and even conservative, CTAA has estimated that existing transit resources currently meet only about half of this population's basic trip needs. [Our estimates and assumptions are detailed in an attachment to this testimony.] These findings are obviously consistent with our view and that of others regarding the scale of restoration required in transit investment and support.

Achieving More Balanced Transit Resources: The gap between the needs of the transit dependent and currently available transit resources varies a great deal depending on who and where you are. In relative terms, there is no question that the gap is greatest in rural areas. Beyond our own estimates that current resources meet only about one-tenth of the needs of the rural transit dependent, data from all of the states on the service areas of their various Sec. 18 grantees show that no less than 40 percent of the nation's rural counties have no Sec. 18 service at all, while in many of those that do, the service is limited in time and/or to only a portion of the county.

Small Urban Areas Suffer Too: We estimate that only about 15 percent of the need is currently being served in the small urbanized areas (those under 200,000 population). And we know that nearly a third of those small urbanized areas are like 40 percent of the rural counties in having no federally-assisted public transportation. Moreover, this year's census is expected to identify some sixty new urbanized areas and only about half of them currently have public transportation service. Finally, for both rural areas and small towns, the decline that has occurred and is continuing to occur in intercity bus service is adding still further to the isolation of many Americans.

Proposed Community Transit Assistance Program: To respond to this imbalance, CTAA urges that a program of "Community Transit Assistance," focused on the needs of rural and small urban areas, be provided with a significantly expanded share of transit funding and that it include assistance for essential intercity bus service as well as adequate resources for "new starts" and expansions (under both Sec. 18 and Sec. 9(a)(1) of the Act) to respond to the needs of currently unserved areas.

As a further response to the need for better balance in transportation resources, CTAA urges that a reauthorized Discretionary Capital Assistance program along the lines of Sec. 3 include some specific geographic earmarks as well as modal earmarks, to assure full access to this source of support on the part of rural and small urban communities.

Linking Match to Ability-to-Pay: One of the factors limiting the availability of public transit in some rural areas is the difficulty of securing the non-federal match required to participate in the Sec. 18 program due to lower income levels and limited local tax base. In CTAA's view, the use of a uniform match requirement in federal transit assistance programs has a regressive impact. It means that access to the funding is easiest for those who least need it and hardest for those who need it most because their own resources are most limited.

The current policy of the Administration of giving preference to those Sec. 3 applications which provide the greatest local share obviously intensifies this effect. CTAA recommends that the match requirement in all transit assistance programs be modified to take account of the relative ability to pay of the community seeking or receiving assistance.

Making Accessibility a Reality: This committee has recently recommended approval of the Americans with Disabilities Act (ADA), which CTAA also endorses because it provides legislative recognition of a basic principle to which our organization is deeply committed: Every American, without regard to place of residence, age, sex, economic status or disability, has a right to the mobility necessary to maintain a decent and productive life. Or, to quote the phrase being used by Project Action of the National Easter Seals Society, "Public transportation is for everybody."

There is no need to tell this committee that adequate funding is essential to make this landmark legislation a reality and not an empty promise. CTAA urges that serious consideration be given to the creation of a National Mobility Trust Fund, a principal function of which would be to assist the transit industry in meeting the mandates of ADA for fully accessible fixed route and supplemental paratransit service.

Improving Coordination in Transit Assistance: It is frequently forgotten that not all federal assistance to transit flows through the Urban Mass Transportation Administration of the Department of Transportation. In fact, the best estimate is that UMTA accounts for only three-fourths of all federal transit assistance. The other fourth is in the form of direct and indirect financing of transportation by various social service programs administered by the Department of Health & Human Services (HHS).

In rural areas, moreover, UMTA may even be the junior federal partner with human service spending on transportation exceeding that provided under Sections 16(b)(2) and 18. This anomaly is another reflection of the backlog of mobility needs not currently being met by public transit investments.

As is often noted -- most recently in the Administration's National Transportation Policy Statement -- better coordination of these differing resources is a priority need if we are to make the best and most efficient use of our transit investment dollar. It is also a priority need if we are to meet more fully the mobility needs of all Americans.

Experience at the state and local level in coordinating public transit and human service transportation confirms two needs: institutionalization of the coordination process and the availability of at least some funding to make integration of resources more attractive and feasible. CTAA recommends that the committee include a major coordination block grant for this purpose in next year's reauthorization of transit programs.

Such an initiative could distribute funds on a formula basis to the states with the condition that those funds be used to establish at the state and substate level formal coordinating bodies that would develop and implement specific plans to achieve maximum coordination of human service and public transportation resources and services. Block grant funds could also be used to attract and match the regular resources of both public and human service providers who would agree to be a part of the coordinated approach.

Restoring Federal Leadership in Research and Technical Support: Finally, one of the areas of federal transit funding that has suffered the most drastic reductions in recent years has been that for investment in research, technology and human resources.

The one exception to the downward trend has been the congressionally-initiated Rural Transit Assistance Program (RTAP), which has been a particularly successful example of state-federal partnership. It has been universally hailed by local operators and state program managers as a long-needed training and technical assistance support mechanism and has led the Department of Health & Human Services to explore the possibility of providing comparable support to HHS-funded human service transportation agencies.

CTAA joins others in the transit industry in urging that restoration of transit support include restoration of the vital leadership role which UMTA can and should play in research and technical support. There is a large and growing agenda for such a role, including continued research on the technology of accessibility, safety, and the linkage between transit and employment as well as to other aspects of economic development. We also urge not only the continuation of the RTAP program, but an increase in its support to match the increase in both costs and the constituency it serves.

Conclusion

That concludes our statement. CTAA is very conscious of the lead role which this committee has played in the development of federal transit policy and programs. We are grateful for the outstanding job it has done in the past and we speak for our riders as well in that regard. Perhaps more than most, community transportation operators get to see on a daily basis what mobility means in the lives of people. It is both a rewarding and a humbling aspect of our jobs. We are aware that much of the credit for what we're able to do goes to you and the others who have developed and supported an ongoing national role in public transportation.

We appreciate this opportunity to be heard and would welcome the chance to continue to work with the Committee and its staff in developing specific legislative language to implement these various recommendations. Thank you.

2. Human Service Transp'n -	270	130	30	110
3. Taxi Service -	1,700	1,480	50	170
Gross Total	10,770	9,980	330	460
4. Used by Non-Dependent -	3,080	2,955	90	35
Net Total	7,690	7,025	240	425
Percentage of Transit Dependent Needs Currently Met -	50%	79%	14%	9%

ESTIMATING "TRANSIT DEPENDENCY" AND THE CURRENT TRANSIT "GAP"

Methodology and Assumptions

These estimates represent an attempt to come up with "ballpark" figures for the number of people who are dependent on public transportation, the magnitude of their "need" in terms of yearly trips, and the degree to which currently available services meet that need.

"Transit Dependent" Population - The object is to estimate the number of people who have no or virtually no access to a private vehicle to meet their mobility needs. The principal source of data was the 1980 Census of Population.

1. Households with no vehicle were assumed to have an average of 2.25 persons in urbanized areas and 2.5 persons in rural (non-urbanized) areas. All are included.

2. Households with a single vehicle were assumed to have an average of 2.8 persons in urbanized areas and 2.9 persons in rural areas. Household heads were excluded to allow for their access to the one vehicle available.

3. One-fourth of all elderly in households with more than one vehicle were included to allow for those unlicensed or otherwise unable to make use of the vehicle that might be available.

4. "Disabled" includes all with either a work disability or a transportation disability (projected to be a total of 25.3 million persons nationwide). One-third of those in households with more than one vehicle were included to allow for their probable inability to make use of the vehicle that might be available.

5. Working adults included assumes an average of 1.3 earners in each non-elderly household with 1 or fewer vehicles. (One working adult is excluded for each household with one vehicle.)

Trip Needs of the Transit-Dependent - These projections consist of two components.

1. Journey-to-Work requirements were estimated assuming that one-third of the working adults (see above) worked at home, walked to work or had access to a carpool. The remainder were assumed to need 480 trips a year (2 trips daily, 5 days a week, 48 weeks a year).

2. Other trip needs assumed an average of 3 trips per week for the non-working population previously

identified as 'Transit Dependent' (156 trips per year).

Transit Trips Currently Provided - These estimates reflect three categories of service and also attempt to adjust for the amount of current service that is utilized by persons other than the "Transit Dependent."

1. Public transportation figures are based on those reported in the APTA Transit Fact Book and the Rural America Directory of Rural and Specialized Transit Operators. Section 15 data was used to allocate service as between small and large urbanized areas.

2. Human service transportation (not receiving operating assistance from UMTA) is estimated on the assumption that the Sec. 16(b)(2) program includes only about one-third of all human service providers.

3. Taxi service level is from the most recent Sec. 310 report to Congress. Distribution as between urbanized and rural areas is based on Census data on use of taxi for journey-to-work.

4. To adjust estimated current service levels on a basis comparable to the need estimates, it is necessary to exclude trips by people not included in our estimates of the 'Transit Dependent' population. Based on income levels reported by Charles River Associates, we have assumed that 30 percent of urbanized trips (other than human service transportation) and 10 percent of rural trips are taken by persons who would not be included in our needs estimates.

Community Transportation Fact Sheet

- The mobility of roughly a third of the U.S. population is restricted because they lack access to personal or private transportation. This transit-dependent group includes 14 million older and 12 million persons with disabilities
- Over the next 10 years, the nation's elderly population will increase from 11% to nearly 17% of the total U.S. population. The frail elderly (over-85) population, will increase from 2.2 million today to 16 million by the year 2050.
- Rural areas have a disproportionate share of the so-called transportation disadvantaged. With 38% of the total population, rural areas account for 40% of the elderly, 42% of the poor, and 43% of persons with disabilities.
- With nearly 40% of the nation's people, non-urbanized areas get less than 4% of all federal public transit assistance and less than 2% of state transit funding.
- Federal transit funding is equivalent to $1 for each rural resident, but exceeds $28 per capita in urban areas.
- 13% of all American households don't own a car; over one third depend on only one vehicle for all their family needs.
- More than half of the rural poor do not have a car of their own, and nearly 60% of the rural elderly are not licensed to drive.
- Almost half of the rural counties in the United States do not have a public transit system.
- Fewer than 1% of rural residents use public transit to get to work, as compared with almost 10% of metropolitan residents. The majority of rural people don't have access to public transportation for work or other purposes.
- Between 1982 and 1986, 3,800 small towns lost all intercity bus service. Over 90% of the communities losing service were under 10,000 in population.
- Today, 10,000 local community transit systems serve more than 15 million people annually. Over 80 percent are operated by private nonprofit agencies. Community transit represents a $2 billion industry, operating over 50,000 buses, vans and paratransit vehicles.

FACT SHEET ON
THE NEED FOR INCREASED SECTION 18 FUNDING

Even if one leaves aside the equity aspects of the current distribution of federal transit assistance, the need for increased funding of the Section 18 program for rural public transit is clear and convincing.

- The Transit Gap Is Greatest In Rural America - Estimates of the "transit dependent" (those lacking full access to a private vehicle) and of the availability of current transit services show that the gap between need and available services is greatest in non-urbanized areas. Total transit service in rural areas (including social service transportation) is sufficient to meet only about one-tenth of the trip needs of the transit dependent in those areas.

- Funding for Sec. 18 Has Dropped While the Network of Providers Has Grown - Between 1985 and 1989, the number of agencies providing rural public transportation has grown by 24 percent (from 937 to 1,160). During the same period, annual appropriations for the Sec. 18 program have fallen by 8 percent in current dollars and by 19 percent when adjustment is made for inflation.

- The Demand for Funds Has Consistently Outrun the Supply - While Congress has provided an average of $67.6 million a year to Sec. 18 between FY'85 and FY'89, actual program spending has averaged $96.2 million -- 42 percent more. This has been possible only because of an initial backlog from earlier funding and transfers from the Sec. 9 program for small urbanized areas, but the backlog has been used up and transfers are declining (see below).

- A Substantial Part of Rural America Remains Unserved - In spite of the growth of the Sec. 18 network, forty percent of the nation's nonmetropolitan counties have no Sec. 18 service at all and in many of those that do have service, it is infrequent and fails to reach all areas.

- Sec. 18 Faces a Capital Crisis - Sec. 18 operations involve more than 10,100 vehicles. Given that 60-65% of these are vans and other small vehicles with a useful life of 7 years or less, the replacement needs for this fleet are minimally 1,800 vehicles yearly. But UMTA program statistics show that Sec. 18 is only acquiring vehicles at about one-third of that rate. This means systems must operate with over-age vehicles and experience higher costs, lower reliability and less safety.

- Availability of Sec. 9 Transfers Has Been Very Uneven - While transfers of unused funds from the Sec. 9 program for small urbanized areas into the Sec. 18 program for rural areas has been a critical source of support in a number of states, its availability has been extremely uneven. In one-fourth of the states, there have been no Sec. 9 transfers to the Sec. 18 program, and in another one-fourth, they have been rare and slight. Not only have less than two dozen states made regular use of this mechanism, but 60 percent of all transfers have taken place in five or fewer states each year.

- Sec. 9 Transfers Are a Disappearing Resource - Since the availability of Sec. 9 funds for transfer depends on their being unneeded in the small urbanized areas, the decline in total transit funding in recent years means that this source cannot be depended on in the future. Indeed, net transfers into Sec. 18 dropped by more than 50 percent between FY'88 and FY'89. It remains to be seen whether any Sec. 9 funds will be available to rural transit in FY'90.

Efficient Transportation - For The Earth's Sake
Testimony to the House Public Works Committee
20 March 1990

Dr. John Holtzclaw

I thank the committee for seriously considering alternatives to continued highway growth. When what you adopt is completed around 2020, let us not be stuck with massive new urban - suburban highways fostering more sprawling suburbs just as petroleum depletion drives up fuel prices and production costs, isolating those suburbs. Adopt a transit program combined with incentives for mixed-use infill development to stave off petroleum depletion and raise our cities' efficiency and international competitiveness.

Massive highway construction will not ease traffic congestion -- but only spread sprawl and congestion to new areas, increasing time lost in congestion, fuel consumption and smog. Newman, Kenworthy and Lyons (Attachment A, from the Sept. 1988 Search) demonstrated this definitively in Australia, where suburban traffic and growth are similar to the U.S.

But highways also have a less understood impact on consumption. Highway driven sprawl has made American urban areas thirsty for fuel, construction materials and land. For example, Phillips and Gnaizda compared a recent middle class single family tract in Davis, California with a middle class apartment house near downtown San Francisco (CoEvolution Quarterly, Summer 1980). Davis is an energy-wise university community and the tract was constructed to its state-of-the-art energy conservation ordinance.

However, as Attachment B shows, residents of the walking/transit-density San Francisco apartments drove 1/4 as much as their suburban cousins. And their multi-family houses and utilities, including roads and postal service, used 40 times less land, 15 times less roadway, 50 times less lumber, 5 times less utility pipe, and much less water and fuel than suburban single-family homes. This is typical of transit-rich cities.

My recent Natural Resources Defense Council studies in the San Francisco Bay Area, conducted for the California Energy Commission, show that **every passenger mile on transit reduces auto use by 10 miles** because transit accommodates higher urban densities and more commerical activities, which afford the convenience of walking, biking or short drives to nearby jobs, shopping and recreation. Consequently, New York City residents, for instance, drive 1/4 the national average and use half as much total energy. Transit

consumes only 1/5 to 1/3 as much fuel per passenger-mile (Brookhaven National Laboratory 50633), with rapid transit carrying 24 times as many passengers per lane as autos, and buses 6 times as many (UMTA, Regional Planning News #99).

I have also found that **doubling residential density decreases auto mileage a minimum of 25 to 30 percent.** So if an area's population doubles by infill instead of additional sprawl, its residents' driving goes up only 40 to 50 percent instead of doubling. These mileage reductions happen naturally; they aren't dependent on auto-restricting laws. These preliminary results have been confirmed by studies around the country.

Other impacts of sprawl and congestion are air pollution and loss of natural areas. Air pollution killed 53,000 Americans annually, the Harvard School of Public Health reported a decade ago. Its annual health care and work-time lost costs are $40 to 50 billion, reports the American Lung Association. And in the San Francisco Bay Area, according to Frederic Nichols of the U.S. Geological Survey (Science 7/2/86), 94 percent of the wetlands have been lost to development. Much of our most productive farmlands have been lost.

How have we come to this condition? We've spent and zoned ourselves into it. Federal transportation funds have favored highways over transit by more than 8 to 1, according to the Conference of Mayors. The resulting auto use consumes 2/3 of our oil and has driven our efficiency to far below that of the Europeans and Japanese. You can reverse that bias and enhance our competitiveness.

Opportunities

Public understanding of the issues is critical to these reforms. Consequently the Sierra Club urges you to:

1. Sponsor research to:

*** compare the relative impacts of highway or transit expansion (with infill development) on:**
- **sprawl and traffic congestion,**
- **loss of forests, agricultural lands, etc.,**
- **consumption of energy and materials in construction,**
- **consumption of energy and water in the new developments,**
- **production of air and water pollution, and**
- **the condition of the inner cities and their residents.**

*** evaluate all present subsidies to motor vehicles.**

Subsidies? Don't autos pay their way? Consulting civil engineer Stanley Hart studied the direct costs of auto use, including police and fire protection, paramedics, the prosecutor's office, and engineering, planning and capital outlays for road projects, from 1965 to 1983 in Pasadena, California, and the revenues generated by the auto for the city (see Attachment C from "California Transit,

July 1986).

Hart estimated that the city and county subsidizes the motorist (direct costs minus revenues) 40 to 50 cents per gallon of gas. Nor is this all the subsidies for the automobile! Local governments and taxpayers provide free parking and make up property taxes not paid by freeways. Individuals and businesses pay for smog-related health and work-loss costs and damage to crops and structures and for time lost to traffic congestion. Corporations provide free parking.

2. Adopt a transportation bill that includes:

*** full cost pricing of auto use -- smog fees, gas taxes, auto sales taxes, licensing and registration fees, toll roads and elimination of subsidized parking to recoup the full cost to society for roads and autos.** The Bay Area Environmental Forum, an organization of major industrial, political and educational leaders, has endorsed a similar transportation program, Attachment D.

*** use of these taxes and fees to build and operate adequate transit systems -- especially rail, with the remainder used to compensate cities, counties and states for their auto-related costs and reduce local sales and property taxes. Assure that transit funds are wisely used by requiring recipients to zone for compact mixed-use development.**

Does Free-flowing Traffic save Energy and lower Emissions in Cities?

P.W.G. Newman, J.R. Kenworthy and T.J. Lyons School of Biological and Environmental Sciences, Murdoch University, Murdoch, WA 6150

Traffic and corridor studies from Perth are analysed together with an international comparison of 32 cities to seek an answer to this question. The data suggest that free-flowing traffic does not save energy or lower emissions overall in a city contrary to previous assertions. This is despite the apparently clear advantages in efficiency for individual vehicles. The reasons for this are examined in terms of travel distances, alternative modes and suboptimal vehicle usage due primarily to the land use structure of the city. The effect of congestion on time savings is also assessed. Some implications for urban road project justification and traffic engineering practice are examined.

Most motorists are aware that automobiles are highly fuel-efficient in smooth, free-flowing traffic and poorly fuel-efficient in stop-start, congested traffic. They are also aware that emissions follow the same pattern. Predictive fuel and emissions models have been developed for vehicles based on the traffic conditions in which instrumented research vehicles are driven (Chang and Herman 1978; Bowyer *et al* 1985). The key parameter in both fuel and emissions models is average traffic speed: the higher the average traffic speed the lower the fuel use and emissions in individual vehicles (for fuel this applies up to average speeds of about 60 km/h). Thus Chang and Herman for example claim: 'We expect that improvements in traffic quality can reduce travel time which, in turn, can directly produce a reduction in fuel consumption' (1978, p. 75). Hence for a number of years there has been a strong research basis for the belief that free-flowing traffic saves fuel and lowers emissions.

We have argued in detail elsewhere (Newman and Kenworthy 1984) that this research on instrumented vehicles is useful in as much as it provides a good explanation of the way fuel is used and emissions are produced by vehicles in urban traffic. This can assist, for example, in comparing scientific advances in motor vehicle engineering, new fuels, new engines and various add-on modifications to vehicles. However, when the results of this work are assumed to apply at a total urban system level, for example, improving average speeds will reduce fuel and emissions overall in a city, there are very serious questions to be asked. For example:

- Does free-flowing traffic cause increased vehicle use through decreases in other travel modes and changes in land use?
- If such increases occur, do they outweigh the gains in fuel efficiency, emissions and time savings for individual vehicles?
- Can traffic research be integrated into urban planning research to resolve this apparent trade-off between gains through vehicle efficiency versus losses due to increased vehicle use?

These questions need to be answered because it is now an established goal to provide smoother, freer-flowing urban traffic systems for reasons of energy conservation and emissions abatement. Most major cost-benefit models justifying road proposals incorporate significant community benefits from fuel savings, time savings and sometimes emissions reductions based on improvements in average speed. Such models have had virtually universal acceptance for around 40 years. Road lobby organisations constantly feed the general public a view that more urban freeways will be in the national interest to conserve valuable oil reserves (RACV 1982; Solloway 1983) and their view is reflected in the policy statements from the National Association of Australian State Road Authorities (NAASRA 1984):

> In 1981, eight per cent of travel was on roads with very low peak hour travel speeds of less than 20 kilometres per hour. Almost half was on roads with peak hour speeds less than 40 kilometres per hour. Projections of future travel speed show that a 25 per cent funding increase would be required to prevent a reduction in already low travel speeds. A 25 per cent increase would also save 110 million litres of fuel, representing a large proportion of all savings which could be achieved by any practical means. (p. 4)

However, such statements do not question whether improved individual vehicle efficiencies from free-flowing traffic will automatically mean fuel savings and emissions reductions overall in cities. The question needs to be asked and answered.

This paper attempts to do that by drawing together several of our recent traffic studies published elsewhere as separate pieces of research. The data are from Perth and from an international comparison of transport and land use in 32 principal world cities. As the main studies are documented in detail elsewhere the methodologies used are only briefly outlined here. The key feature of all these studies is an attempt to link traffic engineering data with a broader urban planning context.

Evidence on the Effects of Free-flowing Traffic

The Perth Driving Cycle Study Between 1980 and 1983, Perth was the subject of an intensive traffic study using a computer-instrumented vehicle (Kenworthy *et al* 1983). The purpose of this study was to develop a driving cycle by collecting a range of representative driving pattern data on all types of roads from the central city to the urban fringe. The instrumented vehicle was used to 'chase' vehicles in morning, evening and off-peak periods

instrumented vehicle in all these conditions was recorded using an accurate fuel meter. This data set which amounted to over 3000 km of urban driving is one of the most detailed collections of data on urban traffic conditions and vehicular fuel consumption collected to date.

As part of this traffic study a comprehensive survey was also made of the broader land use and transportation characteristics of the Perth metropolitan area, including per capita gasoline use on a small zone basis from central to outer areas (Newman *et al* 1985). Hence, it was possible to combine the detailed traffic data involving fuel consumption of individual vehicles with an understanding of the land use patterns and transportation processes that influence resulting per capita gasoline use (Newman and Kenworthy 1988).

The results depicted graphically in Fig. 1 show that there is a trade-off in energy terms between attempting to improve the fuel-efficiency of the traffic system through raising average speeds and trying to foster an urban system which is more fuel-efficient overall. Congestion diminishes significantly from central to outer areas (e.g. average speeds improve 54%) and hence vehicle fuel efficiency improves; however actual per capita fuel use by residents in these areas increases significantly. Vehicles in central areas have 19% lower fuel efficiency than the Perth average due to congestion but the central area residents use 22% less actual fuel, and conversely, congestion-free outer suburban driving is 12% more fuel efficient than average but residents use 29% more actual fuel. It is important to stress that the per capita fuel data incorporate the factor of vehicle fuel efficiency due to traffic conditions.

Why is this so? The obvious link is through the different land use, and the travel patterns induced by these, in the various suburbs. Thus land use/modal split data were examined for each area. These showed that as the distance from the central business district (CBD) increases:

- Density lowers from 23 to 6 people per ha
- Trip lengths increase from 7 to 13 km (for work) and 5 to 9 km (for all trips)
- Public transport service declines from 12 to 0.4 km of service per ha of urban land
- Trips by car increase from 61 to 78%.

This analysis also showed that gasoline usage patterns by suburb do not follow income patterns, i.e., density and income are not correlated nor are travel patterns and income. In other words the land-use is fundamental in determining how much people use a car.

Figure 1. *The trade-off between traffic fuel efficiency and urban system fuel efficiency in Perth, WA.*

The same picture was observed through an analysis of a large household travel survey collected in Perth by the State Government: it was found that for trips by people living at increasing distances from the CBD,

- the average speed of trips increases from 40 to 50 km/h;
- the vehicle efficiency improves by about 10%; and
- the total fuel consumed per capita increases by about 80%.

It appears that the feedback parameters such as land-use factors and modes of travel exert an influence on gasoline use far in excess of the fuel efficiency of vehicles as determined by traffic conditions. In other words, in the congested but denser and more compact central and inner areas travel distances are shorter for all modes and there is greater use of public transport, walking and cycling. In outer areas densities of development are low, travel distances are long and a much higher proportion of travel is by automobile with less public transport, walking and cycling.

The analysis was extended to include emissions (Kenworthy *et al* 1987). Like fuel consumption, emissions of CO (carbon monoxide) and HC (hydrocarbons or unburnt gasoline) from automobile tailpipes are dependent upon the average speed of travel with obvious improvements as average speed increases. NO_x (nitrogen oxides) are only slightly dependent on vehicle speed (Kent and Mudford 1979). The data show the same pattern as fuel consumption: vehicles driven in the Perth central area at 34 km/h average speed have 17–27% more HC and CO emissions, respectively, per kilometre of travel relative to the average for Perth but residents of the area actually generate 19–21% less total CO and HC, respectively, due to their smaller use of the automobile and

greater use of other modes. Conversely in outer areas there is a positive benefit in terms of emissions from vehicles with the average speed of 52 km/h yielding 9–16% lower emissions per kilometre (HC and CO, respectively) than the average for Perth; however, residents of the outer suburbs actually generate some 24–27% more CO and HC, respectively, than the average for Perth residents due to their longer auto travel distances and less use of other modes.

As with fuel, a pattern emerges of a significant trade-off between attempting to control emissions through improving traffic flows and the overall effect this has on the actual amount of emissions produced. In other words higher average traffic speed appears to spread the city, creating lower density land-use, a greater need for cars, longer travel distances and reduced use of other less polluting or pollution-free modes. The benefits gained in terms of less polluting traffic streams appear to be overwhelmed by the sheer amount of extra travel and the resulting bulk of emissions.

Thus the evidence from the Perth Driving Cycle study suggests that in Perth at least, free-flowing traffic is associated with increased fuel use and increased emissions.

Corridor studies in Perth Supportive evidence on the mechanism as to how this effect of free-flowing traffic works its way back into greater use of the automobile and also non optimal use of the automobile, are provided by some corridor studies in Perth.

The effects of free-flowing traffic on public transport use An attitudinal survey was conducted of bus and train passengers who use a transportation corridor in Perth (Kenworthy and Newman 1985). The aim of this study was to assess the importance of road congestion in the decision to use public transport. In particular the survey attempted to find out how many people might transfer from public transport to cars should congestion be significantly reduced or eliminated in the corridor. The survey showed some 17% of bus passengers and 11% of train passengers would transfer if the congestion was eased. It was calculated that if only half of these passengers actually did transfer to cars, the extra gasoline use would be enough to cancel out the savings from a computer-coordinated set of traffic signals along the corridor designed to smooth out traffic flows.

Bus patronage in Perth was examined in freeway corridors and corridors without freeways to see if congestion levels were impacting on patronage. At the time of the survey the freeways were new and traffic was free-flowing. Freeway-related bus services in Perth were found to be declining faster in the average number of passengers carried per service than other bus services, some of which in the relatively congested inner areas were improving their passenger-carrying performance (Kenworthy and Newman 1985). Since then freeways in Perth have become significantly congested at peak hours and public transport patronage in those corridors has been concomitantly.

The effects of free-flowing traffic on vehicle efficiency Not all free-flowing traffic improves the fuel efficiency of a vehicle. As mentioned before, vehicles are generally engineered to perform in a fuel-optimal way at speeds of around 55–60 km/h. A study in Perth was designed to find the fuel and time implications of freeway speed limits and examined optimal driving conditions in freeway and other driving conditions (Kenworthy *et al* 1986).

The study found that increases in the speed limit above 80 km/h involve progressively greater fuel penalties of up to 31% at 110 km/h for an 8 km length of freeway. Our investigation into driving patterns in Perth during 1980–83, found that Perth already has over a third of its c travel at speeds above the fuel optimal speed of 55 k.. (Kenworthy *et al* 1983). Using some simulated urban tr under controlled cruise conditions it was found that ave age speed alone is actually a misleading criterion, even assessing the energy efficiency of a road system *per* This is because higher average speeds are often achiev by merely increasing the potential for higher cruise spee between stops. Thus two trips can have the same avera speed with very different fuel economy, i.e., one tr achieves its average speed by higher cruise speeds to offs idle periods and has much poorer fuel economy than a tr which has low cruise speeds but fewer stops and ic periods.

This Perth study suggests therefore that traffic polici which encourage further increases in cruise speeds such increasing speed limits, freeway building and road wide ing will be counter-productive for energy conservation. the other hand, traffic policies that minimise stops a idling periods while keeping cruise speeds close 55 km/h will save fuel. This means that for energy co servation, roads and signal systems should be designed encourage low travel speeds with fewer stops and short idle periods. Policies that seek to achieve a 'blank increase in average speeds by increasing cruise speeds (e raising speed limits or building more freeways), will mo than likely be counter-productive in energy terms.

The Perth evidence suggests that the conditions und which a policy of constrained cruise speeds might be mo practicable would most likely include:

(1) Higher traffic levels along arterial roads with co puter-linked traffic signals;

(2) A more compact urban form where travel distanc are much shorter and more suitable to a reduction cruise speeds.

Higher density activity also means more intensively us roads with lower cruise speeds so that if at the same tir stops can be lowered it would lead to better fuel efficienc As already shown, higher density areas have lower use transport energy because of greater walking, cycling a public transport and shorter trip lengths. It may therefo be possible to optimise land-use and traffic systems as f as energy conservation is concerned, by pursuing the sar policy of increased concentration of urban activity.

The international cities comparison The Per studies are a powerful indicator of the relationsh between free-flowing traffic and fuel-emissions issues

they provide integrated data between traffic engineering and urban planning, together with evidence of the mechanisms behind the relationship.

However, it could easily be suggested that the Perth system is somehow different and that the relationship should not be extended to other cities. Our most recent study examines the wider situation by assessing the data on gasoline use and traffic speed in 32 principal world cities (Kenworthy and Newman 1987, Newman and Kenworthy 1987). This study is the result of 4 years of data collection and provides for the first time a uniform international data set for comparisons of urban transport and land-use.

Gasoline use and average speed Table 1 contains data on average traffic network speeds, average public transport speeds and gasoline use for the 32 cities. These data suggest that it is the cities with the highest average traffic speeds that have the highest per capita gasoline consumption. Thus free-flowing traffic is not associated with lower fuel use in this global survey. It is in fact cities with the most constrained traffic flows that have the lowest per capita gasoline use as hypothesised by us. The positive correlation between the two parameters is statistically significant.

In terms of public transport speeds, Table 1 also shows that those cities with the lowest overall public transport operating speeds have the highest energy. This is because they tend to be totally or predominantly bus-based and buses simply do not compete in speed terms with private automobiles. The range of bus speeds for the cities is remarkably small, tending to be around 20–21 km/h and never exceeding 25 km/h. On the other hand, those cities with significant rail-systems tend to have much faster overall public transport operating speeds because train systems have average speeds typically about 40 km/h and up to 55 km/h in some cases. Such systems provide very good competition to the automobile for speed of access. Thus the only high average speed which appears to correlate with low fuel use is that of public transport, not private transport.

The other obvious relationship which comes out of these data is that public transport viability is closely

when densities are a minimum of 30–40 people per ha both within cities and across cities as a whole.

The range of fuel consumption in the survey is very large with Australian cities around half the per capita gasoline use of US cities, more than double European cities and six times the level in Asian cities. This variation in gasoline use was analysed and the following general relationships found:

- Not more than half of the variation can be explained by vehicle size, income and gasoline price
- There is a close association between low urban energy use and density of jobs and residents and central city strength
- High gasoline use is also closely linked to the degree to which the city provides automobile infrastructure in the form of roads and car parking.

Thus the international cities comparison suggests that a policy of free-flowing traffic is not a policy for energy conservation, rather it creates greater car dependency in cities through progressively less dense, less centralised land-use patterns, greater overall provision for cars and diminishing viability of public transport, walking and bicycling.

Travel time Urban traffic congestion is generally attacked on the basis of its disbenefit in extra travel times. Table 1 contains data from the international cities comparison on travel times expressed as total average vehicle hours and passenger hours per capita (i.e. time spent in cars and public transport). The data show that there are much higher total per capita vehicle and passenger hours in the American and Australian cities where average road network speeds are high, compared to the European and Asian cities where traffic is much more congested.

The difference in travel time appears to be made up for by greater time spent walking (and cycling) in European and Asian cities so that the travel time budget for all cities is probably roughly the same. However, the data indicate that despite the massive infrastructure for motorised private travel there is no obvious travel time savings in those cities with a large commitment to the automobile — people on average just spend more time in cars.

Perth cf. New York Further verification of how congestion relates to transport and land use was considered possible if the kind of detailed study within Perth could be compared to another city. Although not as complete, some data were collected on New York which is a very different type of city to Perth as it has extreme levels of congestion in its high density central and inner areas. It thus offers the potential for some comparison at the other end of the traffic spectrum from Perth.

Table 2 presents data on New York in terms of gasoline use, average traffic speed and urban density for the central, inner and outer areas as well as the whole city. As

Figure 2. Comparison between Perth and New York showing how gasoline use per capita and average traffic speed varies across the two urban areas.

with Perth the overall energy efficiency of New York clearly improves as congestion gets worse, despite the obvious deterioration in the energy efficiency of the traffic system that would occur from New York's outer areas to the centre of Manhattan.

Figure 2 shows the contrast between Perth and New York. The same qualitative pattern is evident showing lower overall fuel use associated with slower traffic speeds and directly linked to the level of urban density. However, in New York it is even more extreme. Further detailed studies on New York or on a European or Asian city would help to delineate the patterns developed here. However, the evidence suggests that other cities, most of which have greater congestion than Perth, are likely to have an even more positive relationship between congestion and the fuel efficiency of their city with land-use being the key parameter linking the two.

Policy Implications

Urban road project justification The cost-benefit analyses of major road projects usually incorporate time savings, fuel savings and occasionally emissions in their justification. The research outlined here suggests that in urban situations the simple assumptions used in these models are probably wrong. Abelson (1980) in his recent review of the economics of roads seriously questions the

TABLE 2
Gasoline use, average traffic speed and urban density by city region in the New York Tri-State Metropolitan Area

Area	Gasoline use (MJ per capita)	Average traffic network speed (km/h)	Urban density (persons/ha)
Outer area New York	59 590	40.1	13
Whole city (New York Tri-State Metro. area)	44 033	34.9	20
Inner area (City of New York)	20 120	25.8	107
Central city (New York County incl. Manhattan)	11 860	16.1	251

conceptual and data basis of these models, although he only considers the effects on individual vehicles.

As millions of dollars of investment are directed annually into urban roads it would appear to be essential for their justification to be valid. The research conducted here would suggest that fuel (and emissions) would probably be a cost and not a benefit in any complete calculation that involved the whole city. As an interim measure, while better cost-benefit models were being developed, it would seem prudent not to include fuel (or emissions) in road project justification.

Similarly, with time savings it is not a simple matter of predicting vehicle times before and after a new road. What appears to be necessary is a more dynamic feedback process built into land-use/transport modelling which incorporates the fact that new roads will influence land-use and in turn detract from initial predicted time savings.

Traffic engineers and congestion Traffic engineers must daily confront the problem of how to assess the impacts of traffic congestion and what solutions to offer. Their responses are conditioned by a general approach that traffic congestion is always a negative thing and must be eliminated as far as possible; the way they deal with congestion is necessarily determined by the way they think about it. The data in this study and especially the broad perspective gained from the international comparisons offer an alternative way of viewing congestion: that rather than being something which must always be eradicated, congestion can actually be creatively exploited as a tool in helping a city progress towards lower car dependency and lower energy use through a better balance between cars, public transport, walking and bicycling. This concept has sometimes been referred to as 'planned congestion'.

Developments along these lines occurred in Europe in the 1960s when it was recognised that building more large roads was destroying their cities and not ultimately helping the congestion situation either (Hall and Hass-Klau 1985). This was followed by a change of priorities in transportation policy towards public transport and something of an acceptance that certain levels of congestion are a fact of life in cities. The same awareness has become much more common in Canadian cities in the past decade (Cervero 1986).

A similar recognition would appear to be needed in Australia, at least with regard to major new roads in urban areas. 'Planned congestion' could be seen as an opportunity to help contain the outer growth of cities, develop more efficient, concentrated nodes of urban activity, shorten travel distances and in particular it could give priority to public transport. This approach has many benefits including the reduction of transport energy use in our cities. Obviously this approach would not preclude managing or alleviating congestion using established traffic management techniques, especially where environmental amenity or the desirability of living in neighbourhoods was at stake. The Dutch Woonerf concept has been used to manage traffic in an attractive way for neighborhoods.

This approach would not interfere with efforts to optimise traffic systems for fuel efficiency by reducing stops and idle periods without raising cruise speeds and average speeds. However, it would mean a fundamentally different approach to the assessment of major urban traffic problems taking into account the positive benefits of congestion as outlined above. Thus the role of the traffic engineer can change from one of being primarily concerned with alleviating congestion to one of creatively managing congestion. This would place the role of traffic engineers in a much broader context where all actions are closely linked to the broader transportation and land-use planning goals of the city.

Conclusions

The studies ... traffic does not lead to savings in fuel or time, or lowering of emissions in a city overall. The means of achieving these savings appear to be in more fundamental transport and land-use planning, especially the role of urban density and how it relates to travel distances and use of other modes. This understanding can enable congestion to be used as a positive force in improving cities for many purposes including energy and emissions considerations.

The Conservation Potential of Compact Growth

Do studies of urban growth confirm the contention that compact areas help preserve the environment and conserve energy? Let's consider three studies.

The first study looks at the educated, innovative and energy-wise residents of the university community of Davis, California, near Sacramento. In the 1970s they rewrote their building code into an energy-conserving model for low density developments, primarily single family. Stringent energy conservation and use of solar efficient designs are mandated.

Yet, when Michael Phillips and Robert Gnaizda compared a recently constructed middle class single family tract in Davis with a middle class apartment house near downtown San Francisco, they got the results in Table 1. The single-family home dwellers drove nearly 4 times as much! And transportation consumes nearly 2/3 of the nation's oil. The run of the mill urban apartments use less than 1/5 as much heating fuel as the energy-efficient Davis single-family houses. Sharing walls shares and saves heat. Exposing less wall and roof area to the sun reduces summer air conditioning loads. Residential and commercial heating, cooling, lighting and motors consume 20 percent of our country's oil. And the single-family houses consumed 40 times as much arable land--translated, that usually means the farmlands, ridgelands and wetlands we are working so hard to preserve. And they required 5 times as much utility pipes.

The second study is an extensive analysis of two models of suburban growth. In their 1974 study for the Council of Environmental Quality (CEQ) and Housing and Urban Development (HUD), "The Costs of Sprawl," the Real Estate Research Corporation compared typical suburban single-family housing with suburban "high rise apartments."

However, at 33 units/acre, these "high rise apartments" are actually less dense than many older, comfortable urban neighborhoods. Densities of 50 to 100 units/acre are common with 3 to 6 story apartments, and to 400 with occasional highrises and no front-yard setbacks. Examples are the popular Nob Hill and Russian Hill areas of San Francisco traversed by cable cars climbing halfway to the stars. Since the study is of suburban "high rise apartments" with little transit, much land set is aside for parking lots, driveways and lawns.

Even these modest "high rise" densities save considerable materials and resources when compared with single family dwellings. The single family houses consume 4 times as much land for streets and roads and 10 times as much for the houses themselves. The single family houses use nearly 6 times as much metal and concrete, the mining of which threatens many of our natural areas. They consume over twice as much gas and nearly twice as much electricity, and produce over twice as much air pollution with their autos.

And third, let us take a high profile example: New York City. Even with its bright lights and cold climate, it uses half as much energy per capita as the US average, reported the New York Times on 15 November 1981. Such are the benefits of transit and walking. All that, and great theatre, concerts, cheap ethnic restaurants, libraries and stores. Similarly, Europeans and Japanese, with compact urban areas, consume 1/4 to 1/6 as much gasoline per capita as we do.

But, compared to the gluttonous appetite of suburban sprawl, you can be much less dense than York City and still conserve substantial amounts of land, material and energy, as San Francisco densities of Table 1 show. Savings start occuring with densities which make transit service viable, frequent and convenient, so that people generally walk, bicycle and use public transit rather than driving, especially for commuting. A compatible mix of housing, commercial enterprises and industry helps. Homes are close to jobs, stores, restaurants, theatres, bars and recreation. The vitality and liveliness of this mix and density increase a city's attractiveness while cutting its consumption.

Table 1. Phillips-Gnaizda

Resources	City Apartments	Village Houses	Ratio
Copper pipe	2,000 ft.	10,000 ft.	5
Arable land	5,000 sq.ft.	200,000 sq.ft.	40
Roadway	1,000 sq.yds.	15,000 sq.yds.	15
Concrete	17,000 cu.yds.	9,000 cu.yds.	1/2
Lumber	25,000 board ft.	1,200,000 board ft.	50
Utility pipe	450 ft.	2,500 ft.	5
Maintenance			
Daily postal delivery	12 ft.	3,000 ft.	300
Landscaping water	500 gals/day	35,000 gals/day	70
Heating	5,000 BTU/day	27,000 BTU/day	5
Individual auto	25,000 miles/month	90,000 miles/mo.	4

Phillips & Gnaizda, "New Age Doctrine is Out to Lunch on Three Issues," CoEvolution Quarterly, Summer 1980.

Table 2 The Costs of Sprawl (1974 $)

	Single family (3 units/acre) suburban location	Moderate density* condos (33 units/acre) suburban location	Ratio
Streets and roads	3080 $/unit	801 $/unit	4
Utilities (metal and concrete)	5483 $/unit	958 $/unit	6
Water consumption	400 gal/day	190 gal/day	2
Gas	156 therms/mo.	66 therms/mo.	2
Electrical	10,481 KWh/yr.	6222 KWh/yr.	2
Air pollution from autos			2

* E "high Rise Apartments," the highest suburban density studied. (Central city 4 - 6 story walkups with no front yard setbacks reach about 100 units/acre). In urban areas streets, roads and utilities will already be in place, but "infill" might require some enlargement.

California Transit

NUMBER 4 CALIFORNIA TRANSIT LEAGUE JULY-SEPT 1986

Huge City Subsidies for Autos, Trucks

Stanley Hart

In the business world, prices for goods and services must equal production costs plus profit. When prices are less than the costs of production the firm goes belly-up. Or it finds a means of subsidizing the shortfall.

The same rule applies to city governments; while not in business to make a profit and not allowed to go broke, their budgets must be balanced. The services they provide must be paid for; it also follows that those who benefit ought to pay. This article presents evidence that an important group of users does not pay its way with respect to city-provided services.

The city furnishes services for motorists and truckers; the payment received for these services in the recent past has not covered costs, nearly bankrupting the cities. User payments, the fuel and in-lieu tax funds subvented by the State, have never been sufficient, but, because of unprecedented inflation in the sixties and seventies, the shortfall has increased to colossal proportions.

A recent study of the City of Pasadena shows that this shortfall, $1.6 millions in 1965, has steadily increased with inflation until, in FY 1982-1983, it amounted to $12 millions, an amount equivalent to an additional fuel tax of 21 cents per gallon.

[continued, page 7]

Sales Tax Unfair

Art Weber

A sales tax for highways, if approved by the voters, will be totally unfair to California's non-motorists. Driving a motor vehicle is a privilege, not a constitutional right. It should be regulated so it won't cause inconvenience to those who don't drive. Instead, non-motorists have suffered the deterioration and disappearance of local, interurban and intercity rail passenger and bus service, had their cost of living increased to pay for parking spaces they never use, and had options for housing locations limited by development and zoning policies that unfairly presume no one needs to live in walking distance of daily needs anymore. Not to mention the severe deterioration of the urban environment and safety hazards that pedestrians, bicyclists and transit users are subject to on a daily basis.

Instead of studying ways to make restitution for these inconveniences, politicians now add insult to injury by suggesting that those who don't drive should pay taxes to support expansion of a highway system that pedestrians and bicyclists are barred from using major portions of. Funding for established transit routes in urban areas is being reduced while transit funding under SB 878 (the sales tax planned predominantly for freeways) will mainly benefit sub-urban motorists (at remote park and ride lots).

Huge City Subsidies for Autos, Trucks

[from page 1]

Until 1978, the steep rise in real property values saved the cities by increasing tax yields and filling the gap. But proposition 13 brought that to a close. The State then floated the cities for several more years for as long as the existing surplus held out. Finally, the Legislature, reversing the flow of funds, actually preempted the city share of the in-lieu tax for a short period, although this has, hopefully, been returned to city use. Figure 1 shows Pasadena tax revenues for the period 1965 to 1983.

What are these automobile-related services and how much do they cost?

The City of Pasadena furnishes police and fire protection, paramedics, and the services of the prosecutor's office. It provides engineering and planning for public works and capital outlays for these projects. Each of these categories of the City budget is seriously affected by automobile and truck use.

Police Department

The Pasadena Police Department is organized into a number of special "details" for control of the automobile/truck population. These include the motorcycle patrol, details for auto theft, manslaughter, and parking enforcement. The largest category is the patrol personnel whose duties include traffic control, accident investigation, auto theft, etc. An analysis of personnel time and salaries indicates that 40% of Police Department costs are incurred in auto-related activities.

Fire Department, Paramedics, City Prosecutor

Automobile/truck accidents, fires, and garage fires comprise about 14% of Fire Department alarms. 16.4% of Paramedic calls are automobile-related. The City Prosecutor estimates that about one-third of his staff time is occupied with auto/truck cases.

Public Works

The Public Works Department includes t offices of the City Engineer, the Traf Engineer, the Road Department, Sewe Sanitation and others. Each office budgeted separately; thus auto-relat costs are easily segregated. Capital debt service expenditures are identifi readily as well.

Administrative, Public Service Charges

Staff studies have recently determined t proportion of administrative costs to 13.45%. This proportion was added to t total of auto-related expenditures.

Since the Pasadena study included a costs associated with streets it appropriate to subtract an amount for t estimated annual cost of constructing a maintaining an alternative system f public service vehicle access - fire a police protection, garbage collectio freight delivery, etc.

Motorist Contributions

Motorist contributions originates from t principal sources - the fuel and the i lieu taxes - and a third, much small source, the combined traffic/ parki fines, off-road vehicle fees and oth special fees. Because the fuel tax is gallonage tax and because fuel consumpti is comparatively constant, the City sha remained almost unchanged in actu dollars.

The in-lieu tax increased with inflati as new vehicles entered t automobile/truck population, but this w a slow process, the yield increasing f less than the inflationary rate. I yield from traffic fines, etc. depend the level of enforcement which is n related to needs of the City budget, b to optimal requirements for public safet

[continued, next page]

1135

Summary

Following, as an example, are the results of this allocation of City expenditures for FY 1982-1983. Depending on the nature and the relevance of the available records (which, of course, were not intended for this purpose) these figures are variously accurate, but they are always conservative.

	FY 1982-1983 Auto-related costs	Portion of Dept. Budget
Police Dept.	$8,683,300	39.9%
Fire Dept.	949,900	13.8%
Paramedics	142,000	16.4%
Public Works	5,303,000	VAR
Debt Service	555,600	VAR
Capital Projects	2,097,300	VAR
Subtotal	13,726,500	
Administrative	1,846,200	13.45%
Subtotal	15,572,700	
Adjustment for pub. ser.	(-)166,000	
Motorist contribution	(-)3,723,000	
Shortfall (82-83)	$11,683,700	

Figure 2 shows the relationship between City expenditures on behalf of the motorist/trucker, and total contributions to City budgets, by year, for the period 1965, to 1983. The difference between the two curves is the measure of the City subsidy to the motoring public.

We have seen that the motorist and the trucker do not pay their fair share; the property and the sales taxpayer and the State General Fund pick up the tab. The effects of this imbalance have, in the past, lead to the tax revolt, to Proposition 13, to reduced library and school budgets, to reduced street repair and other city services. While the fuel tax has increased marginally in the recent past, the increase has been far less than would be justified by automobile/truck-related costs.

But the troubles of city administrators may be among the least of the effects arising from this skew in municipal finances. The magnitude of the shortfall (or subsidy, as seen by the motorist), when county government shortfalls are added, is probably 40 to 50 cents per gallon. If Pasadena is not atypical, the nationwide subsidy derived from local government is $60 billion annually or about 2% of the gross national product.

Nor is this all; there are huge subsidies for free parking, corporate automobiles and tax-weighted perquisites furnished by retail business and industry avid for clients and employees. The total must amount to hundreds of billions annually; $2000 to $5000 per vehicle. Additional costs to society include lost property taxes when land is converted to freeways and the damage resulting from pollution.

Sophomore economics instructs us in the mysteries of demand/supply/price relationships; no vast intellectual leap is needed to understand that a subsidy of this magnitude will have a significant effect on the rate of purchase and use of automobiles and trucks.

Our love affair with the automobile - it's [illegible] passion, but cash, that plays the critical role.

News Briefs

The Orange County Transit District recently ran a series of full-page newspaper ads proudly proclaiming that "it takes more than buses to move 260,000 people every day." Pictured above this phrase are four rows of diesel buses, a row of vans and three rows of automobiles. [CTL would suggest instead rows of trains, light rail vehicles, automated guideway transit, trolley buses, bicycles and pedestrians with the caption "It takes more than TSM, ridesharing, and diesel buses to move 260,000 people every day"]

OCTD's ads are designed to promote its ridesharing service, Dial-a-Ride and the new carpool lanes on the Costa Mesa (55) freeway. Transit currently accounts for less than 1% of total daily trips in the county and the district's five year plan projects no increase in that figure. [CTL note: carpools and vanpools, while better than solo driving, are not public transit. They do not provide the flexibility of transit.].

MARKET-BASED SOLUTIONS TO THE TRANSPORTATION CRISIS: APPLICATION

prepared for the
Bay Area Economic Forum
by the Forum's
Transportation Task Force

February 1990

MARKET-BASED TRANSPORTATION SOLUTIONS FOR AIR QUALITY

SUMMARY

The Bay Area Economic Forum offers its recommendations for transportation control measures (TCMs) to meet air quality standards mandated by law. The mandates will require an estimated reduction of 35% in motor vehicle emissions by 1997, which means that drastic measures must be considered.

The Forum urges reliance on economic incentives that are typical of a free market economy, measures that give individuals economic reasons to reduce air pollution. By directly linking the source of pollution with payment for the pollution, the Forum approach steers people toward less-polluting behavior, while maintaining freedom of choice. Revenues generated by the measures can fund transportation improvements on the same corridors (such as increased transit and carpool lanes) and to remedy any equity problems.

The Forum recommends against extreme regulatory measures such as driving restrictions and capacity restrictions, because they would endanger the region's economy and are excessively bureaucratic, expensive, or fail to address the basic causes of the problems.

Each proposal is rated on five criteria: (1) impact on air quality, (2) impact on the economy, (3) impact on mobility, (4) implementation/feasibility, and (5) political and public acceptability. Recommended measures include:

Primary Recommended Measures: Incentives to directly reduce emissions.

1. **Smog fee.** Charge a fee based on emissions level of each vehicle.
2. Enhanced vehicle inspection and maintenance program. Reduce emissions by tougher standards and requirements for compliance.

Secondary Recommended Measures: Incentives which reduce emissions indirectly through reduced trips and vehicle-miles.

1. Higher bridge/road tolls, especially during peak hours.
2. Higher gasoline tax.
3. Employer-based financial incentives, including employee travel allowances and parking charges.
4. Regional network of high-occupancy vehicle lanes.

Political acceptability. We acknowledge that our recommendations will be difficult to accept politically. But it is likely that any alternative proposals, if they are seen as effective to meet the goals, will be even more difficult politically. The recent earthquake has perhaps changed the threshold of political acceptability by opening up more possibilities that may have previously been dismissed as impossible.

Forum considerations favor our recommendations, because — unlike most competing proposals — the generate revenues to address potential equity problems. The fundamental equity issue is whether the polluter should pay. Our measures closely link payment to solve the problem with the pollution source. Many other measures break the link between pollution source and payment, and the penalize the low-income driver more, but indirectly through higher prices, taxes and lost economic opportunity. Economic incentives address other equity issues, such as equal treatment for all employees, while regulatory measures tend to place most of the burden on only a small segment of drivers, based on who they happen to work for.

Employer-based commute programs are viewed as measures which have potential to make a contribution. But they can work only if accompanied by substantial improvement in the commute options employers are asked to promote.

A Sweeping Plan to Solve Bay Area Traffic Mess

From Page 1

be to transfer the cost of highway building and maintenance to commuters who drive to work alone, along with penalty fees to be used in financing public transit.

Radical Plan

The recommendations, from the normally cautious Bay Area Economic Forum, include proposals that until very recently were regarded as radical by most elected officials and corporate leaders. Forum members said the proposals are necessary because current policies cannot yield the 35 percent reduction in vehicle emissions that the 1988 California Clean Air Act requires the state to achieve by 1997.

Recent studies have estimated that Bay Area residents are now delayed in traffic jams nearly 100 million hours each year, at a cost in lost wages and wasted fuel of more than $1.3 billion. Congestion levels have risen 25 percent over the past three years alone and are expected to more than double within the next five years.

The Economic Forum, a public-private advisory body chaired by San Francisco Federal Reserve Bank President Robert T. Parry, includes such influential members as National Semiconductor chairman Charles Sporck, retired Chevron board Chairman George H. Keller, Stanford University President Donald Kennedy, University of California at Berkeley Chancellor Ira Michael Heyman and the mayors of San Francisco, Oakland and San Jose.

If adopted, their proposals would dramatically increase the cost of single-passenger automobile commuting — which now accounts for 75 percent of all private transportation to work in the region — and would generate millions of dollars in revenue for public transit.

Economic Balance

"Our chief concern is to find a way to solve the traffic and pollution problems that doesn't damage the economy," said Angelo Siracusa, executive director of the business-dominated Bay Area Council, which jointly sponsors the forum with the Association of Bay Area Governments.

He described the plan as a "market based solution."

Before the proposals materialize, however, they would have to run a gauntlet of fierce political opposition from the public and elected officials.

A number of pieces of legislation would have to be approved, and ballot measures would probably be required at state and local levels.

The main recommendations include:

- A "smog fee" of up to $200 per year for every vehicle based on annual miles driven and the level of emissions produced.
- A tough maintenance program to bring vehicles up to established emission standards, requiring annual inspection of every vehicle and charging up to $400 for necessary repairs.
- Tolls for the use of all new highways and congested portions of existing highways during peak commuting hours and substantial boosts in the tolls charged on the region's bridges.
- A "significant increase" in the gasoline tax.
- The elimination of free staff parking at large corporations and the establishment of employee travel allowances for use on public transit.
- An extensive, regionwide network of car-pool lanes linking the Bay Area's population and employment centers.

Costs would be transferred to commuters who drive alone

Spending the Commute

The combined effect of traffic reduction and new revenue from these measures, the proposals' advocates say, would be to improve average commuting speeds in the region to nearly 50 miles per hour. The average speed today in congested corridors such as Highway 101 and Interstate 80 is about 15 miles per hour.

Tax subsidies or rebates could be used to lessen the burden on low-income drivers, the panel said.

The proposals were unveiled at a press conference at San Francisco's World Trade Center. After the announcement, they were publicly endorsed by prominent figures in the growing movement to find regional solutions to the Bay Area's transportation and other problems, including John Holtzclaw, former San Francisco chairman of the Sierra Club, Alameda County Supervisor Mary King and Sara Conner, former president of the Bay Area League of Women Voters.

Broad based support is important because the recommended policy changes are certain to provoke political controversy among those who perceive them as seeking more than an added tax bite.

"This is a bold, imaginative package, and it will be strongly resisted at first by the public and by many elected officials," said San Mateo County Supervisor Tom Nolan, who conceded that "political acceptability" would be a primary test.

The forum recommended that revenues from the steep new fees must be spent directly on improvements in the traffic corridor where they are generated to allay commuter suspicions that the higher driving costs are purposeless.

"'Pocketbook disincentives' like these aren't popular," King said. "I've talked about such steps for quite a while, and I can tell you that many people equate them with some sort of communism."

Siracusa said draconian regulatory measures under consideration in Los Angeles — rationing fuel or limiting the access of individual automobiles to certain days of the week — would not work because they would produce no new funds for alternative transportation.

Already, California's 1989 State Traffic Improvement Plan is faced with a $4.5 billion shortage, and the Bay Area's Metropolitan Transportation Commission lacks $170 million of the $430 million needed for the year's road maintenance.

Although other U.S. communities have experimented with various user's fees on urban highway systems, none has put a plan like comprehensive into effect.

Sweeping Plan to Solve Bay Traffic Mess

SFC 15/4/90

By Frank Whitney
Chronicle Staff Writer

A group of the Bay Area's top corporate and political leaders yesterday endorsed drastic proposals to deal with the region's growing transportation crisis, including a tripling of bridge tolls and the creation of high-speed toll roads.

The group, the Bay Area Economic Forum, said the measures offer a chance "for a revolution that would change the way people commute or build cars" and would ease the gridlock and poisonous air.

"For years, we've tried to solve the transportation problem by building more roads," said Tyson Sturgeon, chief economist of Pacific Gas and Electric Co. "The fact is that the supply-side approach doesn't work. More roads only bring more cars."

The essential effect would be to transfer the cost of highway building and maintenance to commuters who drive to work alone, along with penalty fees to be used in financing public transit.

Their recommendations, some of the most drastic California public policy proposals, include the widespread institution of employee travel allowances and the elimination of free employee parking privileges.

Page A4 Col. 1

David D. King, Director
Public Transportation Division
North Carolina Department of Transportation

TESTIMONY BEFORE THE SURFACE TRANSPORTATION SUBCOMMITTEE
of the House Public Works Committee

Tuesday, March 20, 1990

As the Congress embarks on the process of developing a new surface transportation program, the North Carolina Department of Transportation appreciates the opportunity to suggest a checklist by which to measure your final product. As you analyze and debate the many crucial issues which must be considered as you develop a new federal surface transportation program, we ask that you keep the following points in mind:

1. Consistency and predictability are essential- State, local, and private sector planning and budgeting should not be contorted by an unstable federal partner.

2. Equity of Distribution - Distribution of funding should be equitable. North Carolina participated heavily in the development of an AASHTO concensus position calling for more equitable distribution of Mass Transit Account revenues. We support the AASHTO recommendation which called for any appropriations made over current levels to be formularized so that each state would get a fairer share. North Carolina has averaged less than $2 million per year from the MTA, while contributing nearly $40 million per year for the MTA.

3. Flexibility - The AASHTO position also called for greater flexibility at the state and local levels in the use of mass transit account resources. Current federal criteria favor bus replacement, new starts, and rail modernization but not ridesharing and demand management strategies which can be extremely effective. These non-capital intensive actions are particularly effective in those regions of the county which have lower development densities yet are experiencing major congestion and air polution problems.

4. Intermodalism - The new Act should encourage, if not force, closer coordination among the modal divisions of U.S.DOT. There should be clear guidelines, for example, on how the Federal Highway Administration and the Urban Mass Transportation Administration should coordinate funding of high-occupancy-vehicle lanes and how those two agencies should work with FAA on airport access. This new Act should move towards a transportation fund rather than reinforcing independent modal programs, the actions of which are not always complementary or coordinated.

5. Rural mobility - The new program should recognize that rural Americans who do not have access to an automobile are more isolated and more in need of public transportation than their urban counterparts. A federal program which distributes over 97% of the formula funds to areas of 50,000 or greater population is not only blind to that fact but grossly unfair as well. I should note that, in North Carolina, the growth in demand for public transportation services from the human service transportation sector, is much more dramatic than from urban fixed route sector.

6. Human Service Coordination - The Department of Health and Human Services spends more than one billion dollars annually on public transportation. These funds are used to get clients to services and are important components of the budgets of programs such as aging, head start, and social services. Partially as a result of hearings held in 1985 by the Investigations and Oversight Subcommittee of the House Public Works Committee, there is a formal working relationship between the Departments of Transportation and Health and Human Services. Much work, however, remains to be done to eliminate wasteful, redundant practices which are allowed or, in some cases, encouraged to continue where coordinated, multi-purpose human service transportation systems are clearly more cost-effective than a multiplicity of single-purpose services. The new act should encourage, if not force, the continued, aggressive pursuit of coordination and cost-effectiveness at the federal, state and local levels.

(To demonstrate that the entire burden of coordinating human service transportation should not be assigned to the Federal Government, it should be noted that many states have not tackled this problem effectively and that coordination of similar services between cities and counties can work very well, even without federal encouragement. Several of our urban transportation systems actually provide countywide human service transportation in conjunction with their urban paratransit (504) responsibilities. In other cases, County-sponsored human service transportation systems work with cities to cover urban 504 responsibilities.)

7. Increased demand for human service transportation - To reinforce the need to provide more equitable funding and to improve cost-effectiveness through coordination, it should be pointed out that there are a number of important trends which all work to fuel explosive growth in demand for human service transportation. These include:

   a. the aging of the population; in North Carolina we have a pilot program which allows drivers license examiners to put elderly individuals who must forfeit their drivers license in touch with the local human service transportation provider. This serves to mitigate the sense of loss experienced by the elderly individual when the license is denied;

   b. heightened awareness of the needs of the developmentally disabled;

   c. the jobs component of the Family Support Act which provides transportation assistance to welfare recipients who are searching for a job or who are in the initial stages of a new job.

8. Americans with Disabilities Act (ADA) - This legislation puts more pressure on public transportation systems without corresponding funding increases. The new surface transportation program should deal with the funding implications of ADA. It must be recognized that, in the absence of increased capital and operating funds, services for the disabled may actually decrease following the passage of ADA. Requiring lifts on all vans and small buses, which are the workhorses of the

human service transportation business, would increase capital and operating costs while reducing capacity. Most human service transportation systems already offer door-to-door services and deploy their vehicles as required to meet the needs of wheelchair-bound individuals. Adding a wheelchair lift to a standard van increases its cost by over 40%, (as opposed to less than 10% for a standard transit bus), thereby dramatically reducing the ability of our current funding programs to meet the demand for human service capital equipment.

9. Regulatory Reform- Through the years a number of regulations have been hung on federal public transportation programs. Their net effect has been to raise costs, lower revenues, and dampen ridership growth. One example is labor protection where the original positive intent of the law has been lost in over two decades of administrative practice which is both inflexible and inefficient. For example, we have a capital grant application for a park and ride lot which has been held up by labor protection concerns for six months, in a situation in which any possible negative effect on existing employees is difficult to discern. The reauthorization of the program offers an excellent opportunity to review these regulations and the administrative practice which actualizes them, and to update and streamline accordingly. Most transit operators would be happy to suggest regulatory reform as a way to stretch the buying power of limited funding.

10. Parking - It is incomprehensible, in a world which is choking on automobile exhausts, that free or underpriced parking is an untaxed employee benefit while employer subsidies to employee of over $15/month for transit passes are treated as taxable income. This sends precisely the wrong signal to commuters making their choices on how to get to work. It remains a source of great frustration to public transportation professionals across the country that this problem remains unresolved.

11. Amtrak - Demand for intercity rail transportation at the state level is growing nationally as states seek to relieve pressure on airports and interstate highways in urbanized corridors. In the intermediate trip length market (less than 400 miles), rail passenger service can be very

competitive, particularly since it generally serves central business districts (as opposed to airports, which are often many minutes from the CBD). As long as Amtrak has a national monopoly on intercity rail passenger service, it makes no sense to starve Amtrak for rolling stock. Many states are willing to step forward and share operating costs with Amtrak, but given its current capital - poor status, Amtrak is having a very difficult time responding to this increasing, healthy demand. We urge you to consider the phenomenon of Amtrak-state partnerships carefully in reviewing tomorrow's public transportation program.

12. Research - Finally, attention should be focused on the lack of problem-solving research in public transportation. The Transportation Research Board completed a study of this subject over two years ago which recommenJed a federally-funded, operator-driven research program. A small set-aside from the formula-assistance programs would enable the creation of a pragmatic research program designed to solve real problems experienced by public transportation systems, both large and small. Such a program should be administered by a professional research organization such as TRB and should be focused on problems identified and prioritized by operators themselves. Such a program would pay rich dividends.

We do not underestimate the difficulty of the task before this committee. We wish for you great energy and great wisdom. We ask that the points we have raised be considered in your deliberations and we offer our assistance in any way possible as you pursue these and other issues. This assistance includes any documentation, clarification or detail which may be of value. Thank you for this opportunity to be heard.

TESTIMONY OF GEORGE LEITZ INTERNATIONAL PRESIDENT, TRANSPORT WORKERS UNION OF AMERICA, AFL-CIO BEFORE THE HOUSE SUBCOMMITTEE ON SURFACE TRANSPORTATION ON REAUTHORIZING FEDERAL MASS TRANSIT ASSISTANCE

Good morning Mr. Chairman, I am Arthur Luby, Legislative Director for the Transport Workers Union of America. I am testifying on behalf of International President George Leitz.

The Transport Workers Union of America, AFL-CIO represents some 60,000 urban bus and subway workers from New York to San Francisco. TWU's membership has a significant and obvious interest in a strong federal policy in support of urban transit. We believe the public has an even greater stake in such a policy. We hope that any UMTA reauthorization bill enacted in to law reflects these values.

Two weeks ago, with great fanfare, the Administration released its so-called National Transportation Policy. As applied to urban transit, it proposed dramatically less federal assistance, more privatization, and elimination of the few labor protections left for transit workers. The only area in which the Administration proposes to increase the federal role is in the area of drug testing. In short, like an annual religious event, when it is time to discuss urban transit, the Department of Transportation feels bound

to deliver the same incantations year after year.

TWU believes that a strong urban transit system is crucial to the national well being. As we now discuss, we believe the central premises of the Administration's transit policy--i.e. forced privatization, elimination of operating assistance for major cities, and repeal of 13(c)--are the exact opposite of a constructive federal policy and are rooted in ideology, rather than the practicalities of urban transit.

Privatization

Ever since 1986 the Urban Mass Transit Administration has required localities receiving urban transit assistance to prove that they were "actively" encouraging the use of private providers. New paperwork was formulated to back up this requirement. And the Urban Mass Transit Administration (UMTA) began to second guess decisions on the contracting out of work, demanding that it be "privatized" under circumstances which were both costly and inefficient.

The chief example of this sort of meddling is the so-called Private Enterprise Participation Project ("PEP") forced on the Miami Dade Transit Authority by ex-Administrator Ralph Stanley. In that case UMTA conditioned receipt of funds to purchase needed rolling stock on the

contracting out of seven profitable routes. The routes were, in fact, contracted out to a private entrepreneur who has not serviced them nearly as well as the Authority originally did. But the Authority, not UMTA, has had to pay for the administrative costs of this experiment. We have little doubt, though, that despite the complaints about service, the private contractor has made a profit. It is not for nothing that one Miami Commissioner has referred to the project as a complete disaster.

Our experience in Miami has been replicated in virtually every city which has entered into this sort of contract. UMTA induced privatization has not lead to new service or new competition. It has simply moved public monopolies over lucrative routes into private hands. The private entrepreneur normally uses a lower paid non-union workforce, then pockets any profit.

TWU does not oppose all contracting out in transit. We do oppose forced privatization. We believe that local authorities and employees are in a far better position than UMTA to assess the efficiencies associated with contracting out work and that the Miami experience shows that forced privatization simply leads to forced inefficiency.

13(c)

The National Transportation Policy refers to the need

not specific, it appears that as a result we will be faced with another assault on §13(c) of the Urban Mass Transit Act.

For many years, 13(c) has been attacked by the Administration as a burdensome provision which has leads to inefficiency. Yet, no neutral body which has examined the issue has found that 13(c) creates either unreasonable or costly burdens on transit authorities seeking assistance.

In reality, 13(c) simply requires an authority to deal and negotiate with its Union on the impact of a particular project on its employees. In some cases, where public employee bargaining is outlawed, it also requires that the collective bargaining process be preserved.

For example, in Houston the TWU negotiated a series of ground-breaking contracts with productivity incentives. These provisions, in fact, dramatically improved the efficiency of the operation. Yet, if 13(c) was not in place the TWU would not have had the opportunity to bargain for these provisions and Houston employees would have had no input in the development of solutions for the system's problems. In short, 13(c) is vital to the preservation of collective bargaining in transit. If Congress is truly interested in employee input and involvement in improvement of transit service, it should not undermine collective

bargaining by repealing or modifying 13(c).

Operating Assistance

Service and maintenance improvement is fundamentally an operating problem. To the extent that various systems have begun to come to grips with the problems of properly servicing their fleets it is in large part due to the availability of operating assistance and guidance from the Urban Mass Transit Administration. We are, therefore, extremely distressed that the administration has again proposed a cut-off of operations assistance for cities with more than a million people.

The fundamental problems facing the vast majority of urban systems are operating problems. In my judgement, few if any systems will be able to properly maintain and service their fleets or protect their capital investments without a strong program for operating assistance. The 1982 STAA, by providing authorities with greater discretion to convert capital to operating assistance, represented a real step forward in this respect.

Similarly, it is absolutely essential that the federal government play a central role in administering transit assistance and devising programs to improve maintenance and service if such assistance is to be

effectively invested. Maintenance of fleets and stocks are the crucial problem in most authorities. This problem simply will not be properly addressed in the absence of a program for operating assistance.

A strong commitment to public transportation provides the solution to a number of the most costly problems our society faces. Motor vehicles are a major source of carbon dioxide and pollutants. A strong public transportation system obviously lessens the need for an excess of private vehicles in urban areas. Further, failure to develop and invest in a sound public transportation policy will create the need for federal highway construction far beyond the present capability of our government.

The DOT's policy does not, in any sense address these concerns. It is our hope that in the reauthorization process all parties can work towards a federal policy for public transit which corresponds to our society's pressing and growing need for transportation. The failure to do so will inevitably lead to far greater costs and burdens in the future.

CHAIRMAN NORMAN Y. MINETA

TESTIMONY OF THE DELAWARE VALLEY

CITIZENS' COUNCIL FOR CLEAN AIR

MARCH 22, 1990

My name is Sara Nichols. I am the staff attorney with the Delaware Valley Citizens' Council for Clean Air. The Council is a non-profit citizens' environmental organization devoted to protecting the public's health and welfare through a cleaner environment. Founded in 1967 on the belief that everyone is entitled to breathe clean air, the Council's primary goals are to inform citizens about the adverse effects of air pollution, to organize citizens to act on their own behalf and to oversee the activities of government environmental agencies. That oversight includes suing government agencies for failure to implement the law.

We are engaged in an experiment the potential consequences of which may be so catastrophic, we simply cannot afford <u>not</u> to

CHRISTMAS SEALS HELP FIGHT AIR POLLUTION

RECYCLED PAPER

do whatever is within our capabilities to counter its effects. This experiment is the burning of fossile fuels and the release of numerous other gaseous compounds from human activity into the atmosphere, causing the rapid acceleration of global warming, known as the greenhouse effect.

Excess carbon dioxide (CO_2) is the principle greenhouse gas. Other gases such as methane and chlorofluorocarbons contributeto the effect as well. The greenhouse effect has been a major topic of discussion since Dr. James Hanson said in the summer of 1988, with 99% certainty, that the greenhouse effect is upon us. Although the United States represents only 6% of the world's population, it produces 25% of the world's total excess CO_2. According to the Department of Energy, about one-third of that amount comes from mobile sources. As vehicle miles traveled (VMT) increases, as all projections show it surely will, transportation will continue to be the sector from which CO_2 emissions grow most rapidly.

Global warming is not the only air pollution consequence with which we must concern ourselves. Troposheric ozone is a greenhouse gas but it poses its own set of unique hazards. Depending on the amount of heat and sunlight on a given day, motor vehicle emissions contribute anywhere from 40%-60% of the ozone precursors, nitrogen oxides and hydrocarbons.

In a recent EPA Region III study, Unfinished Business, ozone was characterized as the environmental problem which poses the greatest risk to human health and the environment. It certainly is one of the

most insidious as well. Over half of our population lives in unhealthful ozone areas. We who are among the millions of people living in ozone non-attainment areas cannot step out of the way to avoid breathing in ozone, as we could step out of the way to avoid being hit by an on-coming train. It is there. We have no choice.

Moreover, the negative effects of ozone pollution accrue over long periods of time. It is an unstable, highly reactive compound which readily combines with anything it contacts. Because of its reactivity, ozone tends to break down cells and biological tissues. Lungs are the organ most vulnerable to the effects of ozone. Indeed, studies show that prolonged residence in high ozone areas is associated with accelerated deterioration in pulmonary function. Ozone scars the lungs and epithelial cells which line the trachea, increasing the incidence of infection.

The federally established National Ambient Air Quality Standard (NAAQS) for ozone is 0.12 parts per million. While at this level or above, the elderly, people with pre-existing respiratory impairment and preadolescents are the most vulnerable to ozone's effects, recent studies show serious effects on young children who are exposed over long periods of time to levels <u>below</u> the federal standard. In fact, healthy adults who regularly exercise outdoors experience negative effects from ozone exposure <u>at</u> the federal health standard.

Symptoms of ozone exposure at 0.12ppm include coughing, shortness of breath, throat dryness, pain on deep inspiration, wheezing, lassitude, headaches and nausea. Because of ozone's high reactivity, there is serious concern about the synergistic effects of its

interaction with harmful substances such as respiratory viruses, cigarette smoke and other harmful air pollutants. Annual estimates of the national health costs and lost productivity costs are usually in the $40 billion range.

Nationwide, ozone is responsible for billions of dollars of damage each year to crops and forests. It is a burning agent, causing leaves to turn brown. It stunts plant growth by reducing photosynthesis, forcing plants to redirect their energy to making repairs thus making them more susceptible to pest infestation. The effects of ozone and acid rain (caused in part by motor vehicle emissions) together are worse than either is alone. Pennsylvania's acid rain problem is one of the nation's worst.

Motor vehicles are the largest source of hydrocarbon, corbon monoxide and benzene emissions. Automobile air conditioners are the largest source of our nation's contribution to depletion of the life-sustaining stratospheric ozone layer. Between 1977 and 1988 the number of automobiles increased 25% and the number of trucks increased 40%, according to the National Highway Traffic Safety Administration. As a result, much of the air quality progress that we have made has been off-set by the tremendous increase in the number of motor vehicles.

According to the Delaware Valley Regional Planning Commission, VMT will be 29% higher in the Delaware Valley in 2015 than in 1987. This sharp increase in traffic congestion will generate more air pollution, economic inefficiency and a tremendous waste of energy. Not one of these can our nation's physical and economic health afford.

The pending Clean Air legislation does not treat mass transit as the major air pollution control strategy that it potentially is. Indeed, attempting to clean up the air without relying on mass transit will be futile. Mass transit should be a mandatory air pollution control strategy in any non-attainment area. It is time to look dispassionately at the monster our addiction to the automobile has created.

We all breathe the same air. It is the air we have borrowed from our children. We do not have the right to compromise the quality of life for future generations. More than anything, our addiction to the automobile is doing precisely that. It is a course of behavior in which we no longer can indulge ourselves. Sixty percent of the total air pollutionin most U.S. cities is caused by motor vehicle exhaust.

Mass transit is the most reasonable and most effective way to alleviate the problems caused by our over-dependence on the automobile. Rather than highway funding sanctions, non-attainment areas should be eligible for and granted funding to be utilized for systems that would reduce VMT, namely mass transit.

Despite the fact that the sticker price of the average new automobile today is comparable to the average cost of a new home a generation ago, the sticker price barely reflects the true cost of an automobile. If one factors in such extras as highway construction, road repair, police patrols, paramedic services and lost wetlands and

property taxes when land is converted to highways, our taxes are subsidizing each car and truck each year to the tune of $2,350.00 for a total of $400 billion annually.

There is no telling what that subsidy would escalate to if one were to factor in the thousands of traffic fatalities (almost the equivalent of our Viet Nam fatalities each year) and injuries each year as well as the environmental costs of ozone and carbon dioxide pollution, acid rain, urban sprawl, noise pollution, the greenhouse effect, loss of animal habitats, accidental oil spills, the annual improper disposal of over 474 million gallons of used motor oil (enough to create a six million square mile oil slick or 43 Exxon Valdez oil spills), desecration of our national parks and oceans from oil drilling and countless other environmental assaults directly linked to our use of the automobile. Even the simple act of filling your gas tank in the absence of a gas pump vapor recovery system allows volatile organic compounds to escape into the air, further exascerbating air pollution.

Our tax dollars pay for this degradation, indeed encourage it. Federal funding favors motor vehicles at least eight to one over mass transit. Our priorities are up-side-down. Public transit truly is cheap by comparison. It is ironic that whenever public transit is brought into the debate, the cries of unaffordable government subsidies are deafening.

Public transit, relative to the automobile, is environmentally benign and cost-effective. It consumes much less space than that required to accomodate motor vehicles. Indeed, half of the land in the

average U.S. city is utilized for or by motor vehicles. Public transit is safer by far. In dollar terms, the loss of health and property incurred by traffic accidents is ten times the total from all crimes of violence combined.

The President calls his national transportation policy, "Moving America Into The 21st Century". At the rate we are going, we will be standing still in the 21st century. Traffic gridlock costs the U.S. $73 billion a year in lost productivity. The fuel that is wasted in gridlock equals fuel about 4% of our annual consumption a year. In view of the increasing congestion and resulting decrease in speeds on the nation's highways, mass transit potentially is faster and more efficient.

Since 1981, taking inflation into account, federal funding for public transit has decreased by 50%. Both President Bush and Secretary Skinner have decided to gut federal funding for mass transit. This makes no sense. It is absurd for the President to cry "No new taxes" and then place a tremendous burden on the states to raise taxes to support transit by themselves, particularly when there are billions of dollars sitting in the highway trust fund.

While the capital out-lay for viable mass transit systems nation-wide would seem prohibitive, consider the fact that in order to bail out the greed- infected savings and loan industry, the federal government authorized an amount greater than all federal funding for mass transit in the past twenty-five years. In seventeen hours and forty-eight minutes in 1986 the Pentagon spent Amtrak's total 1986 budget. Our priorities are absolutely insane.

The cities of the U.S. are the world's biggest consumers of gasoline. Thirty-seven percent of all oil consumed in the U.S. is guzzled by cars and light trucks. According to the American Petroleum Institute, the nation's dependence on imported oil rose to 54% in January. These figures broadcast a future crisis, particularly given the fact that three-quarters of the known reserves of oil are in the Middle East where countries like Iran and Iraq are located.

The average U.S. car gets 18-20 miles per gallon. Each mile it travels it creates one pound of CO_2 emissions. If you travel 10,000 miles a year in your car, you are responsible for over five tons of excess CO_2 in the air. All the while, the combustion from your car's engine is producing nitrogen oxide. The transport of choice by 82% of Americans is an ozone machine. If the cost of owning and operating a new motor vehicle internalized its true external costs, we would see an abrupt end to our addiction to the automobile.

Instead of treating mass transit as a major component in the solution to our air pollution crisis, the federal government treats it like a step-child. The tax code further discriminates against mass transit by allowing employers to provide free parking to automobile commuters through a tax write-off worth up to $400 per month per commuter. Fifteen dollars is the maximum allowed for a public transit commuter. To get an idea of what kind of tax write-offs this means, 43% of those who drive to work in downtown Manhattan get free parking. And that's a city with a functioning mass transit system!

We either pay for our mistakes now or we pay more dearly for them later. The perception seems to be that changing our behavior will be very painful. Consider the fact that Americans consume, per capita, about twice as much energy as the Japanese and the West Germans, yet our standards of living are comparable. A huge chunk of our trade deficit is due to imported oil. In the U.S. the portion of passenger miles traveled by train is about 2.5% In West Germany, it is close to 60% and in Japan it is about 90%. Rather than continue to bash these countries what is essentially for their healthy economies, we should start learning from them.

Our economy, our national security and most importantly our environment are all being compromised by our fossile fuel gluttany. We can no longer afford business and behavior as usual. Substantial funding for mass transit is a must if we are serious about cleaning up our air and reducing our dependency on foreign oil.

PREPARED STATEMENT OF ROBERT MOLOFSKY
ON BEHALF OF JIM LA SALA

INTERNATIONAL PRESIDENT

AMALGAMATED TRANSIT UNION

BEFORE

THE SUBCOMMITTEE ON SURFACE TRANSPORTATION

OF

THE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

U.S. HOUSE OF REPRESENTATIVES

ON REAUTHORIZING THE FEDERAL

MASS TRANSPORTATION PROGRAMS

March 20, 1990

Mr. Chairman:

My name is Robert A. Molofsky, and I serve as Legislative Director of the Amalgamated Transit Union, AFL-CIO, CLC. It is my pleasure to appear here on behalf of International President Jim La Sala to reaffirm our commitment to a strong Federal mass transit program and to outline our policy recommendations for inclusion in a new Federal highway/transit re-authorization bill designed to transport us into the 21st century.

The ATU represents approximately 160,000 public transit workers in the United States and Canada. Most of these are employed as bus drivers, maintenance and clerical personnel in the urban mass transit and over-the-road bus industries.

We, of transit labor, appreciate the opportunity to appear before this Subcommittee, and to offer our comments on the Administration's newly released National Transportation Policy, and to more specifically set forth our views as the Committee seeks to redesign and reauthorize a new national transportation program to meet our evolving transport needs. We, and my fellow panelists, appear here today with the full support of the AFL-CIO and its affiliated organizations representing rail, bus, and other workers; and we also concur in the views to be expressed by the representatives of the Transport Workers Union.

In support of our statement, we have attached hereto the Mass Transit and Privatization Resolutions unanimously adopted at our 49th annual convention held in Anaheim, California in September, 1989. Also attached is a copy of the recently adopted AFL-CIO

resolution on National Transportation Policy, including its section outlining the Federation's views on a strong national mass transportation program, which we equally affirm as reflective of our views and those of all affiliated AFL-CIO transportation unions.

Initially, we raise our voice and join with others appearing before you in asserting that we must begin to define a new National Transportation Program for the 1990's and beyond, through a consensus among a broad coalition of business and labor leaders, legislators and public officials, environmentalists and other representatives of society who benefit from improved transportation. We strongly believe that this consensus must be based on recognizing the mutual needs of all who provide, as well as, benefit from transportation services.

Therefore, we premise our specific views by adding our support to the growing national consensus that a reinvigorated federal Transportation Program, funded in partnership among Federal, State and Local governments is essential to ensuring America's economic competitiveness into the 21st century, solving our growing congestion and energy conservation problems, improving our environment and quality of life, and of course, responding to our growing and changing mobility needs for all citizens in our urban, suburban and rural areas. The startling facts concerning urban pollution, global warming, traffic congestion, and our unmet transit capital and infrastructure needs compel a new policy whereby the Federal government does its share rather than continue

to shift the burden to others. We also take this opportunity to acknowledge and support the Committee's recent deliberations to report the pending Americans with Disabilities Act, which will provide much needed guarantees and improved transport access opportunities for our nation's disabled citizens.

NEW SOLUTIONS FOR A FAILED POLICY

As this Committee meets, we are coming off a decade of transportation neglect, highlighted by an unfortunate decline in federal support for mass transportation assistance. Reductions exceeding 50 percent in federal aid were allegedly justified since 1980 by a rising federal deficit, and a desire to substitute state and local support for substantially decreased federal funds. This federal funding policy has been coupled with persistent efforts to push down transit labor costs by other unjustified transit initiatives. Thus the Reagan and Bush Administrations have sought to undermine collective bargaining and job rights, to take away employee protection guarantees to transit workers, and to impose privatization on the transit industry through skewed competitive standards and threats of reduced funding. The impact of these failed policies has been to leave the transit industry and its workers in confrontation, and our state and local communities financially burdened as they strive to meet their mobility needs.

Recent surveys have shown that 68 U.S. cities are too polluted to meet ozone standards, while 59 failed to meet government

standards for carbon monoxide pollution. Over 100 suburban cities exceed current pollution standards and the carbon dioxide pollution caused by the rising number of motor vehicles is contributing to global warming through the "greenhouse effect". Traffic congestion alone is expected to increase more than 400 percent on the nation's freeways and over 1,000 percent in areas with less than one million in population. Additional demands to serve our aging population, the nation's disabled and continue servicing our maintenance, and transit infrastructure needs require a more activist federal role.

Unfortunately, while the new National Transportation Policy released this month by Secretary of Transportation Samuel F. Skinner recognizes the "urgent need" to improve our mass transportation network and infrastructure, it perpetuates the failed policies of the 80's by opposing any increase in the level of federal capital funding, by proposing steep reductions in federal transit operating assistance subsidies, especially for cities over 1 million in population, and by imposing competitive bid privatization of public transit services as a means of forcing labor cost reductions.

The impact of these adverse transit and transit labor policies has been to place serious financial burdens on state and local governments. The development and implementation of the Administration's "privatization policies" since 1984 have effectively dictated to cities the methods by which local public service should be provided. These policies, as implemented,

require grant applicants to employ unbalanced competitive bidding standards to contract out an ever increasing percentage of their public transit services to private operators as a condition for the receipt of otherwise diminished federal transit funds. Such policies have clearly been counterproductive to effective public transit operations.

This view has been recently supported by the results of a new study issued in September, 1989 by The Economic Policy Institute, an independent Washington research center. This study entitled "The Emporor's New Clothes: Transit Privatization and Public Policy," was undertaken by a group of recognized transit experts based upon a comprehensive year-long review of the Reagan and Bush Transit Privatization Program.

The Economic Policy Institute researchers found that using federal transportation funds to compel communities to "privatize" their mass transit systems, while producing profits for private contractors, caused the deterioration of urban transportation services. Although the stated goals of these "privatization policies" is to reduce the public cost of providing transit services, these transit experts found no evidence that the policy has actually saved money either for the communities effected or the federal government. In fact, they found that it had probably increased the cost of mass transit by implementing a less efficient use of public resources.

Overall, the policy recommendations contained in the new National Transportation Report offer no new solutions and mirror

program initiatives which did not work in the 80's and for which there is no evidence to expect that they will work in the 1990's. The nation's transit operational and infrastructure needs are too great to expect state and local governments to dig deeper, while the Federal government refuses to increase its own funding commitments.

Rather than confine our comments to a continued criticism of the Administration's initiatives we turn now to discuss those major policy recommendations and provisions the ATU believes must be included in any new federal National Transportation Program designed to
effectively respond to our new transportation needs.

MAJOR POLICY RECOMMENDATIONS AND PROVISIONS

1. The ATU believes a strong, dynamic and well funded mass transportation program, operated in partnership with state and local governments is essential to advancing our nation's economic growth and prosperity, and improving its air quality, and providing mobility for all citizens. Therefore, we believe it is essential to reverse the radical and destructive mass transportation policies implemented over the last eight years which have resulted in significant reductions exceeding 50 percent in federal transit funding. We therefore call upon the U.S. Congress to design a new National Transportation Policy for the 1990's which emphasizes increased federal financial support for our mass transportation programs.

The American Public Transit Association and other industry groups have outlined in detail before this committee the urgent mass transportation needs affecting every city, as well as our rural and suburban areas. We are all familiar with the financial burden our declining mass transportation infrastructure places on our urban centers, and the difficulties felt by state and local governments in responding to changing mobility needs. We share the industry's view that a minimum of $6 billion annually in federal transit aid is required to enable communities to respond more effectively to their capital and operating needs. In fact, presently unmet national mass transit needs may require as much as $11 billion annually to make up for prior shortfalls and to respond effectively to future needs.

2. In designing legislation to carry out this enhanced federal effort we believe this Committee should continue to use a framework derived from Title III of the Surface Transportation and Uniform Relocation Assistance Act, known as the Federal Mass Transportation Act of 1987. In this regard, a renewed federal mass transit program must contain an enlarged formula program along with enhanced discretionary funding. The money for this effort must be derived from general revenues as well from significant increases in the transit dedicated portion of the federal motor fuels tax and available for both operating and capital expenses. Indeed,

maintenance of Federal operating assistance for all recipients is a priority.

3. As stated, we support proposals to increase the existing federal highway user gasoline taxes earmarked for public transportation placed within the mass transportation account of the Highway trust fund, on condition that such revenue is used to supplement and not substitute for the general revenue funding portions of the federal transportation program. Increases approaching 7 cents per gallon would provide the revenue necessary to maintain an effective public transit program. As a corollary to this view we recommend that the unobligated balances in the mass transit trust fund be spent as soon as possible.

4. We recognize that in designing a new formula and discretionary grant program some consideration should be given to increasing the recipient's flexibility in the use of such funds. Such flexibility however, should not be allowed to detract from servicing our mass transportation needs, nor otherwise permit any avoidance of planning, environmental, labor protection and other requirements now part of the program.

5. The ATU supports revisions to the federal tax code designed to eliminate the taxation of employer transit subsidies and other disincentives to transit use, and to stimulate private investment in our transit infrastructure.

38-253 O—91——38

Mr. Chairman, we would now like to amplify our discussion of two principle issues which we believe require careful attention by this Committee as it designs its new national transportation program: the Department's privatization policies and the retention of the Section 13(c) employee protection guarantees which for over 25 years have enabled transit labor to work with grant recipients as they have provided expanded services, adapted to technological change and afforded a range of transit alternatives to our nation's citizens. Preservation of this basic labor protection and affirming its original intent to guarantee the collective bargaining and job rights of workers in the industry, and to protect them by equitable arrangements from any unavoidable impacts arising from the federal grant program is an essential component of our support for new legislation.

We have repeatedly stated before this committee that decisions about private sector participation in transportation including decisions to employ competitive bidding, and to subcontract with private operators, should be made at the state and/or local level free from any federally imposed standards, guidelines, policies or grant conditions; and that private sector involvement in public transportation remain a local option which should be examined only when such services can be made complimentary to the existing public transit network and only where there can be a partnership of public and private providers protective of employee interests and the riding public.

Recent experiences in New Orleans and Miami, Florida where portions of the cities' public transit services were contracted out have borne out that privatization is no panacea. In early February, 1990 the New Orleans Regional Transportation Authority voted to terminate its contract with Greyhound Lines, Inc. for the provision of five bus routes after only one year of its expected three year operation because of sharply rising cost increases, ridership losses, and revenue decreases, maintenance and other service problems. The Board concluded, as this Union had long argued, that the RTA could provide better service at a lower cost than the private contractor.

In our view, the policies of the 1964 Act in favor of a neutral federal position as to the choice of public or private service require reaffirmation by the Congress. Only a vigorous restatement of this "neutrality" principle incorporated in a policy directive to the Department of Transportation will be adequate to restore community based decision making on this issue.

This Committee must specifically reexamine UMTA's program guidelines applicable to competitive bid subcontracting under which applicants for federal funding have been forced to operate since 1986. The required use of fully allocated costs by public transit agencies when comparing their service costs to the bid cost of private operators biases the decision making and produces erroneous cost comparisons, which as in New Orleans, end up costing the public more rather than producing real cost saving. To the extent cost comparisons are utilized, they should evaluate the savings

available to the transit agency on a marginal cost basis from the private operator's bid proposals. In no event should this Committee nor the Congress continue to allow UMTA to prioritize applicants' grant funding requests on the extent of their use of private operators and a new bill should specifically incorporate this point of view. We likewise are opposed to any new program elements requiring an increased competitive environment in public transit.

Finally, we turn to an area of special concern to transit labor, the retention of the collective bargaining and job right guarantees contained under Section 13(c), which since 1964 have served as a key component and condition of the federal transit program. The history of the Section 13(c) employee protection program demonstrates that transit labor working in partnership with our nation's transit providers can respond to our nations changing transportation needs in a manner which provides necessary protections to those workers while servicing the riding public demands for high quality safe, efficient and responsive transportation. It is essential, in the ATU's view that any new federal legislation ensure the continuation of these labor protections and their application to the entire transit grant program.

As the debate unfolds on new specific legislative proposals, we are prepared to respond to specific issues and concerns in this area. At this time we wish to note that over the last fifteen months, the ATU was involved in over 458 transit grant applications

involving the processing of Section 13(c) protective arrangements. Over 86 percent (397) of those cases were processed within one month of our receipt of the grant applications. These projects involved both capital and operating assistance, special transit technology, privatization components, alternative fuel arrangements, entrepreneurial and suburban mobility initiatives. Their average processing time was only 13 days.

Clearly, this is a record of which we are proud. It demonstrates our commitment to achieving a fair measure of equitable protection for our members while ensuring a timely distribution of much needed grant assistance. In our view, the administration of the Section 13(c) program has worked well and should remain within the Department of Labor.

Recently we met with Department of Labor officials to discuss ways of improving their Administration of the program and we are prepared to carry on those discussions. We do not believe, however, that it is wise or necessary to modify in any way the current statutory framework which has allowed this program to respond to changing transportation needs while protecting the collective bargaining and job rights of the industry's employees. Proposals to limit the scope of negotiations or the parties' choice of response to privatization issues raised by specific grants are not needed nor justified. When Congress first initiated these protections it emphasized that the arrangements were to be the product of negotiations among the affected parties. Nothing in the

history of the program justifies a change in this procedure or a narrowing of the grants to which they are applied.

In conclusion, we wish to emphasize our willingness to work with the Committee as it seeks to reach a broad-based and bipartisan consensus on our national mass transportation program for the next decade. Transit labor works at the heart of our mass transit services and we take our responsibilities seriously. We are pleased to work with the Congress, the Administration and others throughout the country to improve our existing transit program and provide the best and safest form of public transit for our country's citizens. Thank you for the opportunity to appear before you and we are prepared to answer any questions you may have.

REAUTHORIZATION OF THE FEDERAL HIGHWAY AND TRANSIT PROGRAMS

on behalf of
NATIONAL ASSOCIATION OF RAILROAD PASSENGERS

and
FRIENDS OF THE EARTH
LEAGUE OF AMERICAN WHEELMEN
NATURAL RESOURCES DEFENSE COUNCIL
ENVIRONMENTAL ACTION

March 20, 1990

Mr. Chairman and distinguished members of the Surface Transportation Subcommittee, I want to thank you for the opportunity to testify before the Subcommittee concerning the future of our nation's surface transportation system, an issue of critical importance to the health of the U.S. economy, environment and citizens. This testimony is offered on behalf of the National Association of Railroad Passengers, a consumer organization working for a more balanced national transportation system, and the organizations listed above.

We are living in times of spectacular worldwide change. Events are taking place at a dizzying pace in Eastern Europe--events not believed probable, let alone possible, several years ago. In Western Europe, nations are joining together to create a formidable trading partnership, linked together by network of efficient, high speed trains.

If the United States is to remain competitive and meet the challenges facing the country and planet, some fundamental changes in transportation priorities and investments must take place here at home. As folk singer Bob Dylan wrote, "The times they are 'a changing. And you better start swimming or you'll sink like a stone.."

U.S. transportation stands at a critical crossroads. Construction of the Interstate Highway System is complete but for a few hundred miles. The goal of linking together major cities across the nation with a high quality road system, as envisioned in the 1956 enabling legislation, has been achieved. It is time to set forth a new transportation vision.

Investment in mass transit, intercity passenger rail, high occupancy vehicle, bicycle, pedestrian and other alternatives to flying and driving alone must become a national priority, with strong federal leadership backed by federal funding. Continued reliance on highway building solutions is neither desireable nor helpful in the long run. Current policies and funding result in inefficiencies wherein:

- Cities choke under growing auto and truck traffic and the accompanying air pollution, yet federal investment in mass transit systems that would help alleviate these problems is inadequate and declining (federal transit fundig has plummeted 50%--inflation adjusted--since 1981).

- Peak hour auto travel strains urban road capacity, yet the federal tax structure encourages people to drive alone to work rather than use mass transit or carpool/vanpool and peak hour commuters pay no more for use of the roads than others;

- A growing number of big, heavy trucks accelerate the deterioration of U.S. highways, while rail freight capacity, that could move goods with less pollution, greater energy-efficiency, and reduce road damage costs, is under-utilized.

- Airports and airways suffer from serious congestion, while investment in expanded and improved intercity passenger rail service, that could help ease airway congestion, is neglected.

I. HIGH ECONOMIC AND ENVIRONMENTAL COSTS OF IMBALANCED TRANSPORTATION

Overdependence on autos and airplanes for passenger travel and big trucks for freight transport is unhealthy for the economy, the environment and the liveability of our ciites.

Twenty years after enactment of the Clean Air Act of 1970, air pollution remains a pervasive national problem. Virtually every urban area remains in non-attainment and even our treasured national parks and recreation areas suffer the ills of pollution. More than one out of every two Americans live in areas that fail to meet the healthy air standards mandated by law. The leading cause of non-attainment is auto and truck emissions. The costs of pollution are staggering: the American Lung Association estimates the cost of health care and lost productivity due to air pollution totals $40 billion/year.

Stemming the growth in vehicle miles of travel (VMT) is essential to attaining clean air. Stricter auto tailpipe controls, which we support, will not do the job alone. Until now, removal of the dirtier, pre-1981 cars from the road acted as an offset to VMT growth. After 1995, however, the Environmental

Protection Agency (EPA) estimates that these cars will be off the road and no longer act as a VMT offset. The major mobile source emissions are projected to increase after 1995 for the first time in 20 years. Clearly, we must not only make cars cleaner, but provide good alternatives to auto travel. And, we must get serious about making regional transportation planning and investments conform with air quality goals for the region. The MOU between EPA and DOT concerning Section 176(c) of the Clean Air Act needs to be strengthened.

Lack of balance and integration in our transportation system hurts the economy and jeopardizes national security. Use of petroleum for transportation now exceeds total U.S. petroleum production (Source: US Dept. of Energy, see Attachment 1). Most of this fuels a growing auto and truck fleet. Dependence on foreign oil is rising, contributing to the U.S. foreign trade deficit. In January 1990, a monthly oil import record was set: imported oil accounted for 54% of total U.S. petroleum consumption. And, in 1989 the U.S. sent $50.2 billion overseas to pay for this huge oil appetite.

II. SHIFT FEDERAL PRIORITIES: INCREASE INVESTMENT IN MASS TRANSIT AND OTHER ENERGY-EFFICIENT AUTO AND AIR ALTERNATIVES

A shift in federal investment priorities, with increased funding of transit, intercity passenger rail and other auto and air alternatives will benefit the economy, the environment, safety and our cities. It is a winning strategy! Along with this, a greater commitment to better link transportation and land use plannning is needed. We should strengthen, not diminish the MPO's "continuous, cooperative and comprehensive" (3C) planning process.

While we support the priority the Administration has given to development of a National Transportation Strategy, we oppose its policies that back the federal government away from leadership in transit, rail and other areas, at a time when federal leadership is critically needed.

Present overreliance on highway-building solutions is counterproductive. Such policies encourage auto-dependent sprawl and increased auto congestion and pollution. We strongly oppose recommendations we have seen to add 178,000 new lane-miles in urban areas.

Work of Australian researchers, Kenworthy and Newman, reveals the benefits of promoting cities with good transit and transit-oriented land use patterns. Their study of 32 cities throughout the world found that gasoline consumption in U.S. cities is 4.5 times that of European cities and 1.5 times that of

neighboring Toronto. Within the U.S., the study reveals that auto-oriented cities like Houston and Phoenix use 40% more gas/capita than transit-oriented more compact cities like New York and Chicago. Cities where the proportion of work trips by transit is greatest are those with the lowest gas use/capita (see Attachment 2).

President Bush has called himself the "environmental President" and is committed to a policy of no net loss of wetlands. Investments in auto alternatives to meet new demand are critical to preserving the environment and meeting the no net loss of wetlands goal. U.S. cars are responsible for approximately 27% of U.S. carbon dioxide emissions; cutting back on their use will help solve the serious global greenhouse threat we face. One person using mass transit for a year instead of driving alone to work saves the environment: 9.1 pounds of hydrocarbons, 62.5 pounds of carbon monoxide and 4.9 pounds of nitrogen oxides. The greatest benefits come from use of rail transit (Source: American Public Transit Assn, see Attachment 3).

III. AMERICANS USE GOOD TRANSIT WHEN IT IS PROVIDED

Surveys and experience in cities where Americans are provided with efficient, reliable alternatives to driving or flying demonstrate that Americans will leave their cars at home. Those who suggest otherwise use such rhetoric as a means of justifying cutbacks in federal funding of these vital modes.

A random telephone poll of residents in the San Francisco Bay Area (where citizens rank transportation as the #1 regional problem) found 37% of the 1,441 respondants calling for new rail lines as the most effective way to reduce congestion. No other option had such a high "most-effective" rating (other options ranged from 16-22%). Only 9% rated rail as "least-effective," whereas 30% rated "least-effective" building more freeways and limiting growth and development (Source: "Views of Bay Area residents on Traffic and Growth Issues", MTC). When the Orlando Sentinel asked readers for solutions to the road jams across Central Florida, 10 of 16 published letters advocated mass transit solutions; 8 of those specified rail. Only 2 letters advocated more freeeways (March 12, 15, 16, 1989).

Light rail systems that have opened in cities such as Portland, OR and San Diego, CA have proven cost-effective, exceeded ridership projections and helped to promote energy-efficient land use patterns. These are the kinds of cities where opponents say rail transit can't work. Well, it does work and citizens are clamoring for expansion. In Portland, commercial development that has occurred along the LRT line exceeds the public construction investment. And, weekend ridership is far higher than projected, indicating that citizens are using the

system for shopping and other non-work trips (see Attachment 4, NARP NEWS, July 1989).

IV. CREATE A LEVEL PLAYING FIELD IN TERMS OF COMMUTER BENEFITS

Federal tax policy fails to support efforts to promote alternatives to driving alone. Under tax law, employers can provide free parking, a tax-free benefit worth $200-400/month in major metropolitan areas, but only $15/month can be provided for employees who use more environmentally sound mass transit and if an employer wants to provide more than $15/month, the entire benefit becomes taxable. Also, a portion of the carpool/vanpool benefit is taxable.

This is an important area for change if efforts to get people out of their drive alone habit is to reach its potential. Federal tax law could offer instead a monthly tax-free commuter benefit (ie, $60/month) which employees could apply to the mode of their choice--purchase of a transit pass, toward parking costs or pocket if they walk or bike to work. We support legislation introduced by Rep. Matsui on commuter tax benefits as working toward a more level playing field.

V. CHARGE HIGHWAY USERS FOR A GREATER SHARE OF THE COSTS THEY IMPOSE

It is time to begin charging highway users for a greater share of the costs they impose. We support implementation of congestion pricing to charge those who travel at the peak hour, and impose the greatest costs, a higher cost than those who travel in non-peak hours. Americans accept this practice without question in other areas, such as telephone rates and pricing on metro systems. Carbon taxes or smog fees should also be examined.

Low U.S. gasoline prices contribute to U.S. cities being the highest consumers of gas/capita in the world. U.S. gas prices are among the lowest of any industrialized nation. The key difference in price is tax (see Attachment 4). We support an increase in the federal gasoline tax, with revenues directed to investment in energy-efficient mass transit, intercity passenger rail, HOV, bicycle and pedestrian facilities and to state purchase/preservation of abandoned railroad corridors that can serve as vital transportation or recreational corridors. A portion of the revenues should be used to offset any negative impacts on low income families. This was a key recommendation of the Blueprint for the Environment, a compendium of budget, policy and regulatory recommendations, presented by 30 U.S. environmental organizations to President Bush.

The growing number of heavy trucks travelling U.S. highways accelerate highway and bridge deterioration, yet state and federal studies show that heavy trucks significantly underpay in taxes compared to the costs they impose. The federal Department of Transportation estimates that the heaviest trucks are only paying 65% of their "cost responsibility." This subsidy favors shipment by truck over cleaner, more energy-efficient freight railroads. We recommend enactment of a national weight-distance tax on heavy trucks and oppose further increases in truck size and weights. These were also recommendations of the Blueprint for the Environment. The National Association of Railroad Passengers, joined by the Sierra Club, National Taxpayers Union and Friends of the Earth will shortly release a booklet on the subject of trucks and road damage, which we will provide to members of the Committee.

That completes my testimony. Thank you Mr. Chairman and Members of the Subcommittee for the opportunity to appear before you today.

NOTES: * Except where otherwise noted
Detroit-Pontiac commuter trains discontinued after '80
Some daily commuters now ride Amtrak's "San Diegans"
New metro partly opened in 12/87
Streetcars only; modern metro opened more recently
** 27% and 28% in Frankfurt and Amsterdam, respectively, walk /bicycle (vs 15.3% in Hamburg, 24.0% Moscow, 24.9% Tokyo)
*** Mostly Manhattan

U. S. cities are the biggest gasoline consumers in the world, "being on average some twice as high as the Australian cities, nearly 4 1/2 times higher than the European cities, and 10 times greater than the Asian cities...average over 1 1/2 times higher than Toronto." Detroit is the only big Eastern all-bus city and is the big Eastern city with by far the highest per capita gasoline consumption. 40% variation between Houston and New York.
--LEARNING FROM THE BEST AND WORST: TRANSPORTATION AND LAND USE LESSONS FROM 32 INTERNATIONAL CITIES WITH IMPLICATIONS FOR GASOLINE USE AND EMISSIONS, by Jeffrey R. Kenworthy and Peter W. G. Newman, School of Environmental and Life Sciences, Murdoch University, Perth, Western Australia (1988)

INCREASING OCCUPANCY REDUCES EMISSIONS . . .

Moving more passengers per vehicle mile via transit and other shared-ride services represents a central strategy in cleaning our nation's air.

The average passenger-load of a commuter automobile is measured at 1.20 persons. In contrast, typical transit vehicle loads during rush hours range from an average of 17 passengers on a standard transit bus, up to an average of 37 passengers on a typical subway or "heavy rail" car.* In some cities, the average loads are much higher, meaning an even greater contribution to emission reduction. For example, in Chicago 80% of the city's two million daily commuter trips to and from the central business district are taken on mass transit.

*These average occupancy rates may appear low because the calculation includes mileage traveled to and from garages, and at the end of regular routes.

THE RAIL ADVANTAGE . . .

Transit trips on rail dramatically reduce emissions. For electrically powered rail services such as subways or "light rail" lines, pollution emissions are measured from the power plants that generate the electricity to move the vehicle.

Hydrocarbons and carbon monoxide emissions are reduced by more than 99% when the use of either heavy rail or light rail is substituted for an average commuter automobile trip. In addition, nitrogen oxide emissions are reduced by more than 60%, and particulate emissions decrease by more than 90%.

INTRODUCTION

Mr. Chairman and members of the Committee, our message today is a simple one, public transportation must become a central feature of this nation's infrastructure and transportation system in the years ahead. In years past, we, as representatives of the public transit industry, have sounded this theme repeatedly. Unfortunately, we have had to do so in a budgetary and political environment that repeatedly threatened the wholesale demise of public transit in America.

To a very considerable degree Congress, and particularly you Mr. Chairman and members of this Subcommittee, have persisted in the view that the federal government must remain a full and responsive partner in supporting public transit.

Today, Mr. Chairman, the environment in which we find ourselves has changed. The focus of national interest is on our competitiveness as a world economic force, and on the quality of our environment. What we have come to realize is that outdated and deteriorating transit and highway infrastructure and our increasing inability to move with ease across town or across the country is doing serious damage to both. This fact coupled with expected costs of complying with national social and environmental mandates demand a major new transportation policy supported by appropriate resources.

We have immediately before us a Congressional schedule that can dramatically recast America's public works philosophy for years ahead.

The transit industry set about to explore these emerging challenges and opportunities nearly three years ago in anticipation of the time, in 1991, when new vision and new direction could be interjected into the federal surface transportation program. Our objective has been to develop for ourselves, and to present to you and other decision makers nationally and locally, the actions necessary for public transportation to achieve its full potential in the years ahead. It is our view that, if transit's full potential is not available to us, the nation's highest economic, environmental and social goals cannot be met.

The centerpiece of the Transit 2000 work, revolves around seven key points:

1. Our concept and definition of transit must be broadened to include all forms of high-occupancy shared-ride services;

2. We must set clear goals as a nation and as communities to increase substantially the availability and use of all transit services;

3. Availability and use must be underwritten by major increases in transit investment level by the federal government through an increase of 7 cents in federal motor fuels taxes to be invested in transit, the proceeds of which would, in part, restore much of the 50% decline in real dollars experienced by the federal transit programs over the past ten years;

4. The delivery of federal transportation funds must be refocused in significant part, on our nation's metropolitan and rural areas and local officials given more authority in their use;

5. Greater flexibility in the use of funds must be provided to facilitate rationale and thoughtful local decisions;

6. In addition to direct investment, federal policy in a host of areas - tax, energy, economic development, air quality - must be made mutually reinforcing so that we do not diminish the effectiveness of our investments through parallel policy pursuits; and

7. The promise of planning, service and technological innovations is only as bright as the strength of the committment to research and development.

If we review the transportation policies and programs in place today, it is clear that we are advocating major changes. The balance of our statement describes in greater detail <u>why</u> we believe these changes are vitally needed, and describes <u>what direction</u> those changes should take. Our recommendations for a new generation of national programs have grown out of APTA's Transit 2000 project.

<u>Transit 2000</u>

The APTA Transit 2000 Task Force was convened in 1987 and is made up of nearly 50 members, including general managers and transit board members representing both the largest transit systems in the world as well as some of the smallest. Also included are top corporate executives from private businesses that supply and advise transportation professionals, worldwide.

The mission of the task force was to outline the steps necessary for the nation's public transit industry to achieve its

greatest potential in the years ahead. In pursuing this mission, the task force has explored the full range of issues that affect public policy in transportation, travel demand and industry operations. These have included the changing external environment in which transit and transportation decisions must be made, the long-range mission of the industry, finance and intergovernmental partnerships and other factors that must shape future decisions on how our national transportation network is to be rebuilt and expanded.

The conclusions of the task force are contained in a report entitled, "Managing Mobility: A New Generation of National Policies for the 21st Century," which was issued in November last year and which is included as an appendix to our statement.

The report lays the ground-work for evolution of the nation's transit industry and reauthorization of federal transit and highway programs. In offering these findings, it is our intention to outline bold, aggressive, and innovative policies that will allow our nation's public transportation systems and services to meet fully the challenges and opportunities that lie ahead.

APTA's Involvement in the Transportation Alternatives Group

In addition to the Transit 2000 work, APTA has also participated extensively in the deliberations of the Transportation Alternatives Group, or TAG. The TAG process involved over two years of wide-ranging discussions among twelve public interest groups having major interest in the nation's future transportation policy and federal programs.

We generally support the policy positions endorsed by the TAG and contained in the report entitled "Future Federal Surface Transportation Program."

At the same time, however, we support policies and actions that go beyond those on which TAG consensus was achieved. We look forward to a continuing dialogue with our TAG colleagues as Congress makes further progress in restructuring the federal transit and highway programs.

THE CHALLENGES WE FACE: FORCES OF CHANGE

Changes in the federal program and an expanded role for transit is vital. In communities across the country, we currently are faced with a daunting array of troubling conditions that are growing to crisis proportions. Our shared experience now includes:

- Intolerable and costly congestion on urban and suburban roads with too many vehicles seeking to use limited roadway facilities;

- Increasing isolation of rural residents, the poor, the elderly, those with disabilities, and willing workers from job opportunities;

- Poisoned air that already threatens the health of nearly 150 million Americans;

- Mounting dependence on foreign oil that has become a threat to national security and a major factor in the nation's trade deficit;

- Sluggish rural economic growth due, in part, to inadequate transportation services and facilities;

- Burgeoning urban and suburban development that has overwhelmed our ability to provide public facilities and services; and,

- Failure of our existing infrastructure, resulting from years of chronic underinvestment.

These conditions exist, in part, because current national transportation policies and programs are increasingly ineffective in meeting current and emerging needs. Existing programs promote separation in the planning and funding of different facilities and they are increasingly unresponsive to the economic, environmental and social consequences of transportation investment decisions. The inflexible, categorical nature of existing programs limits how we deploy available resources and decreases the cost-effectiveness and efficiency of our investments. We remain bound by a traditional preoccupation with accommodating vehicles and inattention to accommodating people. Finally, existing programs have become ineffective due in no small measure to the lack of adequate funds.

How we accommodate future demand for travel and mobility will determine whether we can arrest the problems that confront us or whether our national welfare, our economic competitiveness and our quality of life will be further jeopardized.

To avoid this prospect, we must begin immediately to seek wiser ways to meet tomorrow's mobility needs. If we are successful, our transportation decisions can be decisive in taming the forces that threaten to immobilize us. Expanded and enhanced public transportation is an essential strategy in this effort.

A few statistics serve to point out the scope of the challenges and the depth of the problems we face, along with the essential role expanded public transportation services can play.

Congestion and Auto Dominance

Congestion is now a common feature of urban and suburban travel. Delays on the existing street and highway network have already reached crises proportions in major travel corridors and during the busiest times of the day. New highway facilities, even in the suburbs, are virtually jammed when they are opened to traffic. The inability to keep the current transportation network in an adequate state of repair contributes to mounting congestion. The consequence is intolerable delay, economic loss and increasing safety problems for urban and rural residents alike.

- Total travel is expected to increase approximately two percent per year. This would add to the current roadway system over the next 32 years the same amount traffic that has been added in the last 32 years. In faster growing communities, total travel will grow three times this amount annually. It is a foregone conclusion, widely accepted, that highway construction cannot and should not proceed at a pace necessary to accommodate this growing travel demand, as has been the case historically.

- Over the next 20 years, congestion will increase more than 400% on the nation's freeway systems and over 200% on non-freeways, according to the Federal Highway Administration. In areas under one million population, freeway congestion will increase over 1000%.

- The cost of congestion on our urban freeways alone, published in a recent Transportation Research Board report is staggering. In the next 20 years annual delay in travel time will increase by 5.6 billion hours; excess fuel consumption will increase by 7.3 billion gallons per year, and total costs to travelers will increase by $41 billion per year.

- Congestion is a direct function of continuing reliance on private vehicles. Today, average work trip auto occupancy is 1.15, persons per vehicle, nationwide. Household auto ownership is expected to increase past the point where, on average, an automobile will be available for every employed person.

- As consumers, we currently spend more than $336 billion a year on user-operated transportation. This

represents more than the amount we spend on groceries and nearly the same amount we spend on medical care.

- Expenditures for automotive advertising alone totalled nearly $5 billion in 1986, an amount that exceeds the total of all capital investment in public transit facilities and equipment.

- Estimates by state highway officials indicate a need for 102,000 new lane miles of highway on new alignments. Expectations are that it will not be possible to construct all or even most of these facilities. If 20% cannot be built, the demand for public transportation will double.

- Auto availability and use will continue to increase, but the convenience of single-occupancy, personal vehicle travel is likely to deteriorate significantly in more and more areas of the country, heightening the need for new options and strategies to enhance mobility.

The Suburban Problem

The rapid pace of suburban growth and development continues to represent one of the most perplexing transportation problems in the years ahead. Rapid suburbanization has resulted in highly scattered trip-making with near total dependence on single-occupancy vehicles to accommodate suburban travel needs. Current development policies, land use controls and public investment strategies are failing, and wiser ways must be sought to promote and accommodate economic growth.

Some change is beginning to occur. States, regions and localities are adopting often controversial plans and strategies that aggressively guide development in a manner designed to avoid the transportation and related problems that are now occurring.

These development plans require a much broader range of transportation solutions that will capture "choice" riders and serve the particular needs of suburban travelers, emerging corridors and activity centers, and specific trip purposes.

Transit services that served older central areas have growing application in many suburban settings, including radial route networks, internal circulators, shared-ride services, park-and-ride facilities, preferential treatment of high-occupancy vehicles, employer-sponsored ride-sharing programs and others. Clearly, a broader range of high-occupancy, shared-ride services will be critical in our suburban areas in the years ahead.

Central Cities

Despite the concentration of travel demand growth in the suburbs, central cities and central business districts (CBD's) continue to be the dominant single focal point for urban travel, and they remain the economic engine and employment bellwether of the nation. There will be continued strong growth in central cities and CBD's where services, infrastructure, amenities and a large labor pool already exist.

Travel demands in central cities require that increased use be made of traditional forms of public transit, including rail services, bus services, busways and transitways, and a variety of high-occupancy, express services. Where natural markets already exist for these services, or where they are certain to emerge, transportation policy must encourage maximum use of traditional transit services. Failure to do so will further diminish the effectiveness and efficiency of the entire transportation network.

Air Pollution and Environmental Quality

Worsening air quality represents a growing crisis for the nation. The facts that relate air pullution to motor vehicle use and particularly, reliance on single-occupancy vehicles, are undeniable.

- Sixty-eight cities are too polluted to meet federal standards for ozone; 59 cities fail to meet standards for carbon monoxide pollution; over 100 suburban areas exceed current pollution standards.

- Mobile sources cause over 30% of carbon dioxide emissions, the pollutant that promotes global warming via the "greenhouse" effect.

- Motor vehicles contribute 40 to 60 percent of the hydrocarbons that produce our urban ozone and smog problem, and cause 70 to 80 percent of our carbon monoxide emissions.

- Nearly 150 million Americans now live in areas where air quality is below acceptable standards. The American Lung Association estimates the national health care bill for air pollution illnesses is $40 billion per year.

- Ozone accumulation at ground level threatens the long-term economic viability of entire industries. Crop losses due to ozone, smog and other air

pollutants in the U.S. each year equals $1.3 billion.

In years past, tighter tailpipe standards have reduced emissions. In the future, however, emission reductions from new tailpipe standards and technology, will be offset by increased emissions from growth in total travel demand beginning in the mid-1990's, according to EPA. Success in reducing air pollution, therefore, will require aggressive strategies to encourage high-occupancy travel that is more supportive of air quality goals and standards.

Threats to Energy Independence

As a nation, we now risk becoming more dependent on foreign sources of petroleum than at any time since the early 1970s. Major factors responsible for this growing dependency include our increased appetite for petroleum stemming from growth in travel demand and our continued reliance on low-occupancy private vehicles.

- In 1986, autos and small vehicles consumed over 100 billion gallons of gas - more than 400 gallons a year for each man, woman and child in the nation.
- Transportation accounts for 65% of petroleum use today and petroleum imports have risen to 35% of total supply. Over 50 percent of imported petroleum comes from OPEC countries. Imports may go up as high as 60% by 2000. The U.S. Department of Energy considers the current situation, and the likely future situation, a threat to national security.
- Despite today's abundant supply and low prices, some forecasters project as much as an eight-fold increase in petroleum prices after 2000.

Today, however, gasoline prices in North America, and in the U.S. particularly, remain well below world levels, providing a strong incentive for consumption rather than conservation. In the U.S., the 1987 average price per gallon was 82 cents including an average 25 cents in total taxes. In 5 western industrial nations -- America's economic competitors -- the 1987 average price was $2.78 per gallon, including $1.84 in taxes.

Our energy future remains clouded by today's ready supply of petroleum fuels and relatively low prices. But we are short-sighted and unprepared for change. A coherent long-term energy policy must be put in place aimed at wiser ways to accommodate future travel demands.

Inadequate Infrastructure Investment

The proportion of public spending on basic infra- structure has dropped precipitously.

- During the 1960s, public works capital investment totalled $14 - $15 billion for every $100 billion of private investment. Today, the figure is $7 billion for every $100 billion of private investment.

- Since the mid-1960s, federal investment in transportation, as a percent of GNP, has been cut in half.

- Adjusted for inflation, federal spending on public transit has declined nearly 50 percent, just since 1980.

Americans are now witnessing and experiencing the consequences of this declining investment in the form of deterioration and collapse of facilities, a growing backlog of investment needs, mounting safety problems, and declines in productivity.

Chronic underinvestment in infrastructure is compounded by various provisions of the federal tax code. Many of the tax reform measures enacted in 1986 discourage rather than encourage investment in public facilities by making it more difficult and more costly for state and local governments to borrow to support these vital investments.

The trend of declining infrastructure investment, particularly in transportation and public transit, remains a mounting threat to our economy and quality of life. Greater investment is essential.

Demographic Change

A number of socio-economic and demographic trends will have a major effect on the need for enhanced mobility in the coming decades.

- The number of persons over 65 will grow from 25.7 million in 1980 to more than 65 million in 2030;

- The growth rate of the very elderly population over 75 will be even more pronounced.

- The number of women in the work force will increase from 45.5 million in 1980 to more than 65

million in 2000.

- Minorities, predominantly black and hispanic, will account for nearly 60 percent of the population growth through the year 2000; 25 to 30 percent are projected to have incomes below the poverty level.

  By 2000, the black labor force will expand 31 percent and the hispanic labor force will expand by more than 80 percent.

While auto availability and use by these groups will rise, the elderly, the disabled, women, minorities and the economically disadvantaged will remain highly dependent on public transportation. By virtue of their sheer numbers, these segments of the population will require that increased attention be paid to their particular travel preferences and patterns, and the availability of options to the use of private vehicles must be increased substantially.

How Should We Respond?

These forces and trends have powerful implications for the role of public transportation in the decades ahead.

Simply allowing these current trends to play themselves out with only a limited, remedial response, and diminished federal involvement is shortsighted and will surely damage our long-term economic, environmental and social interests.

Our problems and challenges are national in scope; they demand a broad-based national strategy and federal action plan. Transportation investment must become a national priority and a clear, long-term commitment must be made to expand our transportation options. Greater use of all forms of transit and high-occupancy, shared-ride services must be a fundamental element of this strategy and an explicit goal for the nation.

TRANSIT'S ROLE: ENHANCED MOBILITY AND SUPPORT FOR NATIONAL GOALS

Our domestic goals as a nation are clear:

- We desire a strong, growing and competitive economy with opportunity for all to share in the benefits of economic prosperity;

- We desire an improved quality of life and a clean environment; and,

- We desire greater personal mobility in the pursuit of enhanced opportunities. Finally, we wish these goals to be accomplished not only today, but on behalf of future generations.

The fundamental mission of the transit industry parallels exactly our national goals. The transit industry is dedicated to the goal of enhancing mobility and our personal freedom of movement. The commitment to mobility, however, must be pursued in new ways, including diversification in the types of services offered and greater attention to the diverse actions necessary to better manage mobility.

A Strategy of Diversification

It is clear that the future of our communities and the nation will not be well served by a federal transit policy that narrows and withdraws. Enhanced mobility for transit riders and others, increased economic vitality and improved environmental quality can only be achieved if the role of public transportation expands and diversifies, matching more intelligent service design to changing customer markets and wiser patterns of growth and development. Such diversification demands an increased federal commitment, not a diminished federal role.

In communities where a broader range of services are now being provided by transit agencies, and the role of transit agencies has expanded and the quality and use of public transportation has risen.

A diversification strategy requires action on two fronts. First is the need to broaden the definition of transit. Second is the need to expand and coordinate efforts at all levels, lead by the federal government to better manage mobility.

Broadening Transit's Definition

All forms of high-occupancy and shared-ride services must be incorporated in the broader definition of public transportation including rail, bus, car and van pools, employer-sponsored programs and other forms of ride-sharing.

In embracing this broader definition, the transit industry is committed to:

- Increased efforts to maintain, upgrade and adapt existing systems and services to meet the needs of current riders and markets;

- Development of new high-capacity systems and services in the highest density corridors of our major metropolitan areas; and

- Increased experimentation, introduction and integration of innovative, cost-effective, service options in urban, suburban and rural areas where mobility needs cannot be met fully by traditional transit services.

National policies and programs must encourage and directly support both maximum use of traditional transit services in markets where they are most effective and a broader mix of transit investments in markets where traditional services may not be fully effective. In addition, the charter of the Urban Mass Transportation Administration (UMTA) should be expanded to reflect both the breadth of this mission and the expanded definition of transit.

The New Role: Managing Mobility

Today, no single agency has responsibility for managing mobility. Within this vacuum, the transit industry must become a catalyst in creating an environment - both physical and institutional - that will promote a wider range of choices in travel and greater use of traditional transit and other high-occupancy, shared-ride services.

The transit industry's broadened role in the overall management of mobility includes assuming greater responsibility for a wide range of activities. Transit agencies must be strongly supported in their efforts to:

- Convene, coordinate, contract, broker and promote services and approaches beyond those traditionally operated by public agencies as a means to restore and maintain a balanced and efficient transportation system. Ridesharing, high-occupancy programs, transportation management organizations, guidance and counsel to business and development interests must all be viewed as central to the expanding role of the transit agency of the future;

- Educate citizens, community leaders and local officials on the range and nature of service options, the need for new roles and leadership by public transit agencies, and the unacceptable consequences of poor policy-making, planning and development; and,

- Promote and ensure stronger integration of land use air quality and transportation decisions so our urban areas develop in a form that can be served more effectively by public transportation services.

Elevating these new roles and establishing a new, comprehensive approach in managing mobility in the regional setting is a major focus for public transit agencies and national policy in the future.

What Transit Can Deliver

Expanded availability and use of transit and other forms of high-occupancy, shared-ride services holds great promise. Among the major advantages that flow from greater reliance on transit are:

- Congestion Relief

  Every bus full of passengers at rush hour removes 40 cars from traffic; every full rail car removes 75-125 cars from traffic; every van full of passsengers removes 13 cars from traffic.

- Reduced Highway Cost

  One high-occupancy vehicle lane carries the same number of people as 3 regular highway lanes.

  Major highways can cost $100-120 million per mile; busways can be built for $4-12 million per mile; light rail for $10-20 million per mile and heavy rail for costs comparable or lower than major highways.

- Energy Conservation

  A savings of ten to 15 gallons of gasoline is realized every time 40 single-passenger-car drivers take a a 10-mile trip to work on the bus.

  30-40 million gallons of gasoline would be saved each day if average commuter vehicle occupancies were increased from 1.1 passengers per vehicle to 2.1 passengers per vehicle.

- Air Quality

  When one commuter leaves the car behind and uses transit to and from work for one year, the health of millions of Americans can be improved through the removal of 9 pounds of hydrocarbons, 63 pounds of carbon monoxide, 5 pounds of nitrogen oxides and 1 pound of particulates, annually.

- Safety

  The highway death toll - 46,644 in 1988 - can be reduced, along with 1.8 million annual auto-related injuries.

- Economic Growth

  Every $10 million in transit capital investment supports 770 jobs; every $10 million in transit operating investment supports 960 jobs.

  Every $10 million in transit capital investment produces $33 million in business revenues.

  Every $10 million in transit operating investment produces $30 million in business revenues.

- Disabled Services/Senior Citizens

  Transit is the only mode of transportation that can adequately meet the growing needs of disabled and senior citizens.

PRINCIPLES TO GUIDE REAUTHORIZATION OF THE FEDERAL SURFACE TRANSPORTATION PROGRAM

As an initial step in reformulating national transportation policy and recrafting federal transportation programs, consensus must be reached on basic principles. The following principles are offered as a guide to reformulate the nation's surface transportation programs.

1. THE FEDERAL SURFACE TRANSPORTATION PROGRAM SHOULD BE RESTRUCTURED SUBSTANTIALLY IN ORDER TO ADDRESS MORE INTELLIGENTLY THE MOBILITY NEEDS OF THE NATION AND ENSURE PROGRESS IN MEETING OTHER NATIONAL GOALS. Current highway and transit programs are not adequately responsive or flexible to address current and emerging needs and problems. Substantial restructuring makes sense however, only if done in combination with the addition of significantly increased federal resources.

2. THE CONCEPT OF TRANSIT SHOULD BE BROADENED TO ENCOMPASS AND PROMOTE INCREASED AVAILABILITY, USE AND COORDINATION OF TRANSIT AND OTHER HIGH-OCCUPANCY, SHARED-RIDE SERVICES IN ORDER TO SERVE BETTER DIVERSE TRAVEL NEEDS, AND TO REDUCE GROWTH IN VEHICLE-MILES OF TRAVEL WHILE ACCOMMODATING INCREASED PASSENGER-MILES OF TRAVEL. Federal goals must be stated clearly. Doing so invites closer linkage between mobility goals and broader national goals, broadens the transit constituency, promotes investment in new mobility strategies and a broader range of services, and encourages relaxation of existing program restrictions. Each step, in turn, increases the attention paid to serving people rather than vehicles.

3. EXISTING REGIONAL DECISION-MAKING AUTHORITY OVER THE USE OF FEDERAL TRANSPORTATION FUNDS SHOULD BE ENHANCED AND STRENGTHENED. The local ability to assess needs, set priorities and deploy resources in a local area context must be strengthened to better serve transportation and other major national and regional goals.

4. GREATER FLEXIBILITY SHOULD BE ALLOWED IN THE USE OF FEDERAL FUNDS AND A STRONGER MULTI-MODAL APPROACH TO PLANNING, FUNDING AND DECISION-MAKING MUST BE ESTABLISHED. Better integration of transportation decisions, planning, and funding is necessary to make appropriate trade-offs between multiple goals and objectives on the local and regional levels, to make more cost-effective use of resources, and to reduce federal micro-management of resource decisions and administrative actions that restricts the ability to respond to emerging needs and problems.

5. THE RELIABILITY AND PREDICTABILITY OF FEDERAL FUNDING MUST BE IMPROVED THROUGH INCREASED RELIANCE ON FORMULA ALLOCATION, INCREASED RELIANCE ON DEDICATED SOURCES OF FUNDING AT THE FEDERAL LEVEL, AND EXPANDED USE OF MULTI-YEAR FEDERAL FUNDING COMMITMENTS. Recipients of federal funds must be able to project and depend on stable sources of support to design and carry out multi-year projects and programs. Annual uncertainty and delays in establishing the level of federal support for transit and highways must be eliminated.

6. THE COSTS ASSOCIATED WITH MANDATED FEDERAL ACTIONS AND THE SUBSTANTIAL CONTRIBUTION OF PUBLIC TRANSPORTATION TO THE ACHIEVEMENT OF OTHER MAJOR NATIONAL GOALS PROVIDES JUSTIFICATION FOR CONTINUING FEDERAL SUPPORT FROM ALL SOURCES. The costs of actions required by federal law or policy are substantial and increasing. All sources of support for transit investment should be brought to bear in the years ahead. The linkage of mobility goals to other federal goals is made stronger by the commitment of both dedicated and general funds to support mandated actions.

7. SUBSTANTIAL ADDITIONAL FEDERAL FUNDING SHOULD BE PROVIDED FOR PUBLIC TRANSPORTATION TO FULLY CARRY OUT THE GOAL OF SIGNIFICANTLY INCREASING THE PROVISION AND USE OF HIGH-OCCUPANCY, SHARED RIDE SERVICES. Federal transit funding has been reduced 50% in the last eight years in real terms. All indications are that historic disinvestment in transportation, the current condition of facilities, and future travel demands require at least a doubling of the total transit investment. The increase should be borne by all funding partners, led by the federal government.

8. AN IMMEDIATE 7 CENT GASOLINE TAX/MOTOR FUELS TAX INCREASE SHOULD BE ENACTED CONCURRENT WITH REAUTHORIZATION OF THE SURFACE TRANSPORTATION ASSISTANCE ACT, AND FEDERAL MOTOR FUEL TAXES SHOULD BE MADE PERMANENT TO SUPPORT NEEDED TRANSIT AND HIGHWAY INVESTMENT; FULL REVENUES FROM THE TAX SHOULD BE COMMITTED ANNUALLY. Needs are immediate. The traditional source of transportation funding should continue to be the basic resource for increased investment. Aggressive claims will be made by other interests on gasoline tax increases, and action on federal revenue increases, including the gasoline tax, likely will take place sooner rather than later.

9. THE FEDERAL TAX CODE SHOULD BE REVISED TO PROMOTE PRIVATE AND NON-FEDERAL INVESTMENT IN TRANSIT, AND TO ELIMINATE THE TAXATION OF EMPLOYER TRANSIT SUBSIDIES AND OTHER DISINCENTIVES TO TRANSIT USE. Other federal policies should

strongly support direct investment in and use of public transportation rather than frustrate achievement of the goals that federal transit funding is intended to meet.

10. FEDERAL TRANSPORTATION POLICIES AND PROGRAMS SHOULD REQUIRE CLOSER INTEGRATION OF TRANSPORTATION INVESTMENTS AND LAND USE DECISIONS IN ORDER TO PROVIDE AN ENVIRONMENT THAT IS CONDUCIVE TO AND ENCOURAGES INCREASED PROVISION AND USE OF HIGH-OCCUPANCY, SHARED RIDE SERVICES; OTHER FEDERAL POLICIES AFFECTING TRANSPORTATION DEMAND AND INVESTMENT SHOULD INCORPORATE THIS SAME OBJECTIVE. Unless development practices and policies at the local level are consistent with and supportive of basic federal transportation goals, the effectiveness of direct federal investment will be diminished greatly, along with the opportunity to advance other national goals. Federal attention to how land uses and development are arrayed across the landscape is necessary to reinforce these linkages.

11. EXPAND FEDERAL SUPPORT FOR BASIC RESEARCH, DEVELOPMENT, TRAINING AND HUMAN RESOURCES ACTIVITIES AFFECTING TRANSIT, AND ENSURE ADEQUATE DIRECTION OF THE PROGRAM BY TRANSIT INDUSTRY OFFICIALS. Today's challenges require a renewed and expanded federal commitment to basic technological and transit service planning and delivery research.

12. FEDERAL OPERATING ASSISTANCE FOR ALL SIZES OF TRANSIT SYSTEMS IS AN ESSENTIAL ELEMENT OF THE FEDERAL PROGRAM AND MUST CONTINUE TO ASSURE ADEQUATE MAINTENANCE AND EFFECTIVE OPERATION OF THE TRANSIT CAPITAL INVESTMENT. Transit systems ranging from the nation's largest multi-mode system to the smallest single mode system require continued federal operating support as a critical component of a varying mix of funds to support vital transit operations.

13. FEDERAL POLICIES AND MANDATES REQUIRE ADDITIONAL COSTS TO TRANSIT OPERATIONS AND CAPITAL INVESTMENTS AND AS SUCH FEDERAL FUNDING SHOULD BE PROVIDED TO MEET THESE REQUIREMENTS. The transit industry will always strive to carry out the numerous responsibilities mandated by federal policies. These mandates should be supported by concomitant resources so as not to become hollow utterances giving rise to false expectations.

NEW FEDERAL TRANSPORTATION PROGRAM FOR THE 21ST CENTURY

Rebuilding and expanding the nation's highway and transit systems to ensure they are responsive to the enormous demands that lie ahead require that national transportation policy be reshaped and federal surface transportation program restructured substantially.

The Metropolitan Transportation Program

In response to widely varying needs and circumstances in ever expanding local areas as central cities and suburban area expand their reach, federal transportation resources should be provided directly to these ever growing areas under a new and simplified Metropolitan Transportation Program at the federal level.

A broad local focus has become essential. At this level, the complex and interrelated issues of central city and urban-suburban travel can be attacked comprehensively. The full spectrum of regional social, economic, and environmental relationships must be addressed in the design of effective transit services. The components of this broader view include:

1. A formula program to support continuing reinvestment in existing public transit systems and services;

2. A formula program to support continuing reinvestment in our existing highway system;

3. A federal source of formula funds for major expansion of either transit or highway capacity, giving local officials the flexibility to decide what mix of projects and investments best suit the local need to expand capacity; and,

4. A federal discretionary program as part of the above three program categories targeting federal investment to major capital projects, either transit or highways, as well as addressing the "lumpiness" of needs by geographic location and over specific time frames.

The Transit Categorical Program: A Source Of Funds For Reinvestment

One of the most profound problems facing our nation's transportation system is the degree of deterioration that has been allowed to take place. Very simply, we are failing to fund the maintenance our current systems and facilities at adequate levels.

The fact is evident to anyone who travels anywhere across the country, and it certainly is not a problem unique to our metropolitan areas. The cost of deferred maintenance is enormous: our personal safety is jeopardized increasingly; the efficiency with which we move people and goods is diminished and the time lost increases the cost of doing business, effecting the competitive posture of our entire economy. We pay larger amounts

to maintain vehicles properly, and the ultimate cost of repairing or replacing our transportation facilities increases substantially as maintenance is deferred.

No element of our surface transportation systems is immune. The backlog of investment requirements for maintenance and upkeep is both staggering and mounting. Because of the cope of the problem, the fact that it can be measured easily, and its high visibility and far-reaching consequences, a new federal transportation program must provide resources specifically targeted for critical maintenance and reinvestment.

In providing funds targeted for reinvestment, it is appropriate to continue to allocate funds directly by mode. The various types of transit and highway reinvestment can be measured precisely, there are relatively few reinvestment expenditures that should not be made, and there is little rationale for trading off one type of reinvestment against another under current circumstances.

Reinvestment in and maintenance of our existing transit and highway facilities and services should be a national priority supported by the direct flow of federal funds.

Definition of Reinvestment

For public transportation, "reinvestment" would be defined as all capital investment required to replace, rehabilitate, maintain or upgrade existing plant and equipment, along with the capital investment necessary to retain the existing transit market share of trips.

Providing the capital funding to maintain transit's current market share through the transit category program would allow increases in services, including new system development, on a scale commensurate with local or regional population growth. These additions to capital plant and service levels are differentiated from "major capacity expansion" that would be funded from a shared, multi-modal source of federal funds. Nevertheless, the transit category could support as eligible projects from within its formula or discretionary component some high-capacity new starts to include rail, that could be necessary to maintain transit's modal market share.

It is anticipated that the majority of transit systems across the country would have their capital needs fully met at the federal level from the funds made available through the transit category element of the program.

Operating Assistance

The transit reinvestment element includes the continuation of federal support for transit operations for systems and communities of all sizes. There are a variety of strategies that might be considered to re-examine the eligible elements of operating cost, and/or limit the federal exposure or responsibility for operating costs. Nonetheless, some form of federal operations support will remain a critical component of a federal program for all transit systems be they large or small.

Recipient

The recipient of federal transit categorical or reinvestment funds would be the current "Designated Recipient" of UMTA assistance. For the purpose of reinvesting in existing transit facilities and services, the current designated recipients - most often the local or regional transit agencies - are best qualified to formulate plans, and construct and carry out necessary capital improvement programs.

In addition, in the formulation of a new federal surface transportation program, it is important to minimize the disruption to long-standing intergovernmental decision-making process with respect to basic reinvestment in existing systems and facilities. The current designated recipient mechanism allows for both continuing consultation among local and state officials and for potential change in the designated recipient should state and local officials consider it desirable.

Allocation of Funds

Federal funds available for a transit categorical would be allocated primarily by formula, using primarily the existing UMTA Section 9 formulas. Continued formula distribution of small urban and rural funding should be maintained. In the absence of any compelling reason to alter these long-standing formulas, it is important again to minimize change and disruption to current practices wherever possible and to build upon the strengths of current processes. In addition, formula distribution of monies for rail modernization needs could be desirable.

The balance of transit categorical monies would be available on a discretionary basis to address (1) the fact that individual areas of the country may from time to time require a greater infusion of capital than could be available on a formula basis, and (2) reinvestment requirements to retain market share would exceed formula receipts.

The Flexible-Use Categorical Program: A Shared Funding Source

While long-deferred maintenance and reinvestment, including modal-share retention, require greater attention and emphasis as part of a new federal program, these needs cannot be pursued to the exclusion of efforts to expand both transit and highway capacity as needs escalate. Travel demands already overwhelm our systems and will continue to increase in the years ahead. Additional capacity will be essential to maintain a mobile America into the next century and beyond.

Therefore, the proposed broad-based metropolitan Program includes a separate element designed to support major capacity expansion as well as extraordinary reinvestment needs. Unlike federal funds provided for routine reinvestment and modal-share retention, federal funds to support major capacity expansion would be made available to areas as a shared or pooled resource, without regard to mode.

The single, multi-modal source of funds is intended to encourage much stronger integration of transit and highway planning and programming than historically has been the case through today's highly separate programs. The use of a common resource for financing is intended to promote more rational trade-offs between various types of investments and more highly integrated project designs. More cost-effective facilities and services should result.

Definition of Flexible-Use Category

The Flexible-Use Category element of the metropolitan program is intended to be a source of funds for all transit projects typically included in the current UMTA definition of "major capital investments." The definition would include new rail systems, transitway and busway projects as well as extensions to existing systems and major expansions of service area. The expansion of bus fleets and services, beyond those needed to maintain transit's current market share also would be funded from this combined federal resource.

The addition of lanes and the construction of new highway facilities on new rights-of-way, within a broadened local area system also would be supported from the Flexible-Use Category element of the program.

Capital Investment Only

Funds for the Flexible-Use Category would be available for capital projects only.

Recipient

Current designated recipients of federal transportation funds and the process providing for their designation should be retained. Decisions regarding the disposition of funds flowing from the transit category should be decided on by the existing transit designated recipient; highway category funds decisions should continue to be made by the current highway designated recipient. With regard to the use of funds flowing from the flexible category, both transit and highway designated recipients must agree on locally developed multi-modal transportation systems plans.

As part of the process of programming flexible use funds, a certification should be required that transit needs are being met prior to any monies being committed to exclusive highway project use. The Administrator of the U.S. Department of Transportation's Urban Mass Transportation Administration ought to be involved in the sign-off process.

Allocation of Funds

The majority of funds from the Flexible-Use Category should be allocated by formula and the remainder through a discretionary process.

Examples of the factors that might be considered in developing suitable formulas for allocating these funds include transit ridership, use of all forms of shared-ride services, vehicle occupancy data, motor fuel tax receipts attributable to a region, motor fuel sales, motor vehicle registrations, and others. The major objective in developing a formula is to ensure that funds flow in relation to need, but also in relation to the specific goals to be accomplished, i.e., increased vehicle occupancy and transit use.

Federal Discretionary Investments

The proposed Transit Category as well as Flexible-Use Category are designed to function predominantly as formula programs supported primarily from dedicated federal funds drawn from motor fuel and related user fees. For a variety of reasons, however, it will remain important to maintain a discretionary source of funds at the federal level to support both the Transit and as the Flexible-Use Categories.

The most important rationale for federal discretionary spending on transportation is to ensure there is a resource available to support the extraordinary costs of individual

projects that otherwise could not be funded through an annual formula apportionment of funds. Many, many examples of such projects can be drawn from recent transit and highway experiences.

Though it is desirable to make capital investments within the Transit Category program on a regular, recurring cycle through better planning and capital programming, these investment needs will continue to be "lumpy" by their very nature. The availability of discretionary funds at the federal level within this category will continue to provide a means to respond to this need.

While the discretionary program must provide for the "lumpiness" problem, it should also focus on projects that provide demonstrable, positive impacts on the solution of problems declared to be of national significance. Obvious examples include: reduction in vehicle-miles-traveled (VMT) growth, congestion relief, reduction of mobile-source emissions, reduction of safety hazards, direct encouragement of economic development activities, expansion of services to the elderly, those with disabilities or the disadvantaged, or attraction of added sources of non-federal funding.

INVESTMENT REQUIREMENTS

Overview

Estimates from a variety of sources confirm the need to increase total federal investment in transit and highways by more than 100 percent. Today U.S. Department of Transportation spending includes $16.7 billion annually, $3.2 billion for transit and $13.5 billion for highways. We believe a total federal investment of not less than $25 billion per year and as much as $34 billion is needed, based on combined estimates of transit and highway needs.

Transit Investment Requirements

Federal investment for public transportation should be increased to at least $11 billion annually, including roughly $6.5 billion for essential reinvestment and $4.5 billion for capacity expansion. In arriving at the recommendation that federal transit investment should be set at $11 billion annually, a conservative set of assumptions was used, reflecting:

- a commitment to reduce the current backlog of transit reinvestment requirements and ensure a regular cycle of rehabilitation and replacement based on industry projections from current capital programs;

- a commitment to fund costly mandates imposed at the federal level including increased accessibility for the elderly and disabled, and introduction of cleaner buses and other clean air measures;

- a commitment to more than double U.S. transit ridership to a level comparable to current per capita transit use in Canada;

- a commitment to increasing the proportion of transit trips on vanpools, carpools, high-occupancy lanes and other shared-ride services to at least 15 percent of all transit trips;

- cost factors that reflect the current median costs of various service options.

A more ambitious set of ridership goals and cost estimates, adjusted for future inflation, would require a level of federal investment in transit significantly above the $11 billion annual figure.

Even without a national commitment to substantial increases in transit ridership, however, the federal transit program must be increased from $3.2 billion to at least a range of $6 billion to $8 billion per year. This minimum level of federal transit investment is necessary to meet the reinvestment requirements of existing systems and services, to continue major new projects that are already in the advanced stages of planning and development, and to fulfill new federal requirements for services to the disabled, introduction of low emissions technology and a host of other federal mandates - in essence this amount is needed merely to be, in real dollar terms, where the federal funding level was some ten years ago.

Costs of Implementing the American with Disabilities Act

While final disposition of the pending Americans with Disabilities Act has yet to occur, based on the Senate passed bill, APTA has estimated the possible cost implications of that bill. S. 933 would require that all new buses and rail vehicles be accessible to handicapped individuals, including those who use wheelchairs, and that public transit operators offer paratransit services as a supplement to fixed route public transportation.

In addition, the bill includes a requirement relating to the accessibility of mass transportation facilities. Specifically, all new facilities, alterations to existing facilities, intercity rail stations, and key stations in rapid rail, commuter rail, and

light rail systems would have to be accessible to handicapped persons. It is estimated that the total costs of implementing S. 933 over the next 20 years could be as follows:

	Million 1989 Dollars
Motor Bus	
Capital	1,050
Operating	850
All rail modes	
Capital	4,299 to 6,384
Operating	1,608 to 3,328
	7,807 to 11,612

In short, it is estimated that the costs of compliance for rail and fixed route bus transit could amount to $7.8 billion to $11.6 billion over the next 20 years. The additional costs of paratransit services are more difficult to estimate, but they could be as much as $13 billion in capital and operating expenses over the next 20 years.

There appears to be little disagreement that additional costs will be imposed on transit operations to accomplish the provisions of the ADA requirements. However, as noted below, estimates do vary as to their exact size. The Congressional Budget Office (CBO) estimates as follows:

o	Cost of new lift equipped buses (added costs caused by S. 933)	$30 million/yr
o	Increased maintenance cost	$15 million/yr
o	Expanded bus fleet because wheel chairs use more space on bus	not estimated
o	Cost of increased paratransit svcs.	"Significant"
o	Transit facilities	"Hundreds of million of dollars"
o	Retrofiting rail stations and vehicles	$1.4 to $1.7 billion
o	Increased rail Operating and Maintenace Costs	$14 million to $21 million/yr

Costs of Implementing Clean Air Act Provisions

As with the Americans with Disabilities Act, no final conclusions have been reached scope and requirements of a new

Clean Air bill. However, should the industry be required to convert over to alternatively fueled vehicles other than diesel, the following estimated costs to the industry may result:

- $700 million to convert the 230 garages in the affected areas to accommodate new fuel storage

- $100 to $150 million per year increase over the current annual vehicle replacement costs because alternatively fueled buses are more expensive

- $500 million to $900 million increase per year in fuel costs.

Finally, even if the current alternative fuel mandate is expanded to include "Clean Diesel Engine Systems," as has been urged by the transit industry, there will be significant new costs to transit. We believe many transit systems will convert to alternative fuels and the technology to produce clean diesel engines is costly and will require additional maintenance.

Highway Investment Requirements

Depending on the assumptions used, figures compiled by the American Association of State Highway and Transportation Officials (AASHTO) indicate a need for urban federal highway reinvestment that ranges from over $8 billion annually to nearly $13 billion. Federal support for highway capacity expansion could require an additional $10 billion per year if scenarios for "fully improved service" on the nation's highways are to be pursued.

The Rural Transit Program

Metropolitan areas of the country are not alone in their struggle to enhance mobility and make progress in achieving other local and national goals. The transportation needs of residents of small urban and rural areas across the country are as immediate and as complex as those that confront the residents of our largest metropolitan areas.

In considering how best to support the transit needs of small urban and rural residents, there appears to be little reason to consider wholesale restructuring of the current federal Section 18 program. Through this program, federal funds are apportioned to the states, which then make funds available to local jurisdictions and transit operators to support programs designed at the local level and reviewed by the state. The funds are available to support either capital or operating investments,

at the discretion of the local recipient, via consultation with the state.

The most important change necessary to the Section 18 program is an increase in the funding levels. Clearly the small urban and rural transit assistance program could benefit easily from at least doubling of federal investment.

Although major restructuring of the small urban and rural transit program does not seem to be necessary, essential changes are needed in federal policy that will make the rural transit program more effective, and make more efficient use of federal funds. One of the most important actions that can be taken to increase the effectiveness of available rural transit funds is to streamline and coordinate the use of UMTA Section 18 funds with the federal (and state and local) human services programs for transportation of specific client groups. Recent experience repeatedly reveals that efforts at integrating rural transit services, combining available resources, and consolidating program management and administration are thwarted by myriad program-specific requirements that often are contradictory or irreconcilable once funds are in the hands of local program sponsors and managers.

SOURCES OF FUNDS

Increased Federal User Fees

Federal motor fuels taxes and associated user fees have been the primary source of funding for the nation's highway program and a major source of support for transit since 1982. Increased federal funding necessary to support the levels of transit and highway investment envisioned in the future should continue to come from this basic source. Increases in federal motor fuels taxes are, therefore, required and should be enacted permanently, in 1991, concurrent with reauthorization of the federal Surface Transportation Assistance Act to support transportation and not be diverted to deficit reduction or other non-transportation uses.

Support for a $25 to $34 billion level of federal investment would require a motor fuels tax increase of equivalent to 8 to 16 cents. To ensure federal transit investment of $11 billion annually would require 7 cents of the motor fuels taxes increased to be available for transit investment in addition to current levels of federal transit support. To bring federal transit investment up to minimum need levels - $6 to $8 billion per year - will require the equivalent of another nickle of federal motor fuels taxes dedicated to transit.

Deliberations over how to restore investment in our public infrastructure and how to meet transportation needs, traditional transportation user fees must be increased immediately and rededicated exclusively to transportation investment.

Non-Federal Finance

Direct federal investment in transit and highways must serve two purposes. First, federal funds must directly underwrite major projects and improvements. As importantly, however, federal investment must serve as a catalyst to attract stable and reliable financial commitments from local and state government and the private sector. The goal of bringing added non-federal resources to transportation should be a prominent part of a new national program and can only be achieved if significant increases in federal investment are provided.

The most effective way to attract non-federal investment is to incorporate into federal policy and programs a comprehensive series of fair and equitable incentives to attract greater state and local funding, increased financing from private sources, and increased financial participation by users and beneficiaries.

As part of this effort, consideration should be given to new pricing mechanisms that recover more of the costs of services and facilities, particularly the costs of auto and highway use. In addition, federal allocation mechanisms must reward increased investment without disadvantaging communities that may be struggling economically.

An effort must also be made to remove the current disincentives to increased transportation investment that exist in federal policy. Transit agencies, for instance, must allowed, encouraged, and rewarded for seeking increased revenues from non-traditional sources, including new types of services, real estate and development activities and other sources.

Future transportation needs - both transit and highways - require a comprehensive financial strategy guided and underwritten by increased direct federal investment.

Federal Tax Provisions

Current federal tax provisions limit overall investment in and the effectiveness of transportation facilities, particularly public transportation services. A host of federal tax provisions discourage private investment in transportation facilities, greatly restrict the financing powers and options available to state and local governments, and raise the cost of state and local borrowing for infrastructure investment.

Current tax provisions governing state and local bonding ceilings, limitations on private participation in public facility finance, arbitrage restrictions, sale/leaseback transactions — among others should be reviewed carefully and refashioned to support new national transportation goals and policies.

In addition, fringe benefit provisions of the federal tax code provide a significant economic incentive for auto use and a disincentive to increased transit use. Current tax law allows employer-subsidized free parking, which may be valued at several hundred dollars per month, to go totally untaxed while those who receive employer-subsidized transit passes are fully taxed once the value of monthly employer support exceeds $15 dollars. This imbalance must be remedied.

As part of the effort to rewrite the federal surface transportation programs, federal tax law must be rewritten to support rather than undermine greater investment and use of public transportation.

On March 14, 1990, representatives of the transit industry testified before the House Committee on Ways and Means on tax matters affecting the industry. The focus of the hearing was on the tax impacts on environmental quality. The suggested tax changes discussed with the Committee were those that would influence greater availability, use and investment in transit as a fundamental clean air strategy. A copy of our statement is attached to further elaborate on the types of issues that need attention in the tax code.

ISSUES AND PROPOSALS AFFECTING A NEW TRANSPORTATION POLICY

Land Use and Development Coordination

Land development patterns dictate the nature of our travel demands. To enhance mobility and freedom of movement, greater attention must, therefore, be paid to how land uses and development are arrayed across the landscape. It is imperative that we provide incentives for development that can be served by public transportation more easily and effectively. Concentrating development, more mixed-use development, supportive parking requirements, policies and pricing, and attention to a host of critical site and building design features are all required.

Across the country there are a growing number of examples of how this is being done. New federal transportation programs should encourage these efforts and ensure that both transit and highway investments are premised on the existence and implementation of effective land use plans and development controls.

Clean Air Policy

The nation's Clean Air Act will soon be revised and extended to provide new direction in restoring the quality of the nation's air. Historically, federal clean air initiatives have concentrated exclusively - and effectively - on the technological means for reducing tail pipe emissions but have been largely silent on the impacts of growing travel demand.

Within the next five years, however, growth in vehicle-miles of travel will result in increased emissions that will not be off-set by new tail pipe technology. As a consequence, air quality will worsen.

A pronounced shift in our transportation - air quality strategy must be made to deal more aggressively with travel growth and travel behavior. Both clean air policies and transportation policies should be coordinated to embrace actions that reduce vehicle-miles of travel (VMT) where possible, restrain the growth in vehicle-miles of travel and aggressively promote options to single-occupancy vehicle use. Particularly in areas now suffering the most severe air pollution, federal transportation funding ought to be shifted to investments that more directly accomplish these ends.

APTA supports a number of provisions now being discussed in the House and Senate versions of the Clean Air Act. Among these are provisions aimed at:

1. Reducing vehicle-miles of travel in non-attainment areas;

2. Strengthening the conformity of clean air and transportation plans;

3. Redirecting federal transportation funds to cleaner, high-occupancy facilities and services if clean air planning and responses are lagging;

4. Focusing on emissions, standards as opposed to mandating specific fuels and technology thereby allowing the market-place to determine the most cost-effective and efficient means of meeting stringent emissions.

Despite these measures, however, progress will be in doubt unless adequate funding is in place, and proper incentives are built into the transportation investment decision-making process at the local level.

National Energy Policy

Among the most significant factors affecting our choice of transportation options is the cost of various modes of travel. Today, as an expression of unstated national policy, we price gasoline at levels far below those that exist in other countries around the world. We subsidize and, therefore, directly encourage low-occupancy automobile use.

At the same time that artifically low energy prices act as an economic incentive for increased low-occupancy automobile use, we fail to recover the full cost of auto use or account fully for the consequences of reliance on low-occupancy, personal vehicle use.

We have held the price of energy artificially low and have grossly underestimated the costs that must be borne for use of petroleum fuels.

National energy policy must be carried out, in part, through provisions in our surface transportation program, particularly through increased availability and use of transit.

Proposals From Other Transportation Interests

Virtually every transportation interest, nationwide, has begun to offer and promote views on how our transit and highway programs should be restructured. All promote major change; all support the need for additional federal investment; and, all promote the need for greater flexibility on how recipients can use available funds.

There are differences, however, among proposals you have heard and will hear in the weeks and months ahead. In addition to offering our proposals, we would like to indicate also those ideas and concepts with which we would raise cautions.

National Transportation Policy

We are encouraged that the Bush Administration has recognized the necessity of a national transportation strategy for the 1990s and beyond. The new policy acknowledges the need for attention to our aging transportation infrastructure and points to mass transit as a key element of our national transportation system.

The policy, however, is long on advice and short on help. We are very disappointed with its view that the federal government should reduce its promotion and funding of mass transit

service and turn over to cities and states the main responsibility for dealing with this critical issue.

We had high expectations during last year's nationwide series of public hearings when dozens of individuals and groups called on the federal government to take a higher profile on mass transit.

Those witnesses called for an aggressive national policy to deal with worsening traffic congestion, air pollution, depletion of our energy resources and a policy to pay for the repairs and expansion of our transportation infrastructure. More and better bus, subway, car pool and other ride sharing services were identified as important solutions to those problems.

Environmentalists, business people and an ever-widening community of interests are in agreement that there should be an increased role for mass transit in our society. If we can agree on the need for mass transit, then surely we can come together with the federal government on a program of action.

The Administration's policy would give Uncle Sam junior partnership in the traditional intergovernmental alliance that has underwritten mass transit for more than 25 years. By delegating to cities and states the increased financial responsibility for transit service, the Administration is opting for the inevitability of higher state and local taxes in overburdened state capitals and city halls, more passenger fare increases or service reductions.

Measured against the identified needs, the Administration's policy falls short by:

- Not establishing a national goal of more mass transit use as an alternative to the private automobile;
- Not proposing increased federal investment in mass transit and ride sharing service;
- Not offering to cover the expense of costly federal mandates affecting transit, such as the provision of accessible service and tailpipe emission improvements;
- Not proposing Tax Code changes which would encourage private investment in transit and give equal treatment to transit and auto parking employment benefits.

We suggest a better approach including:

- Expenditure of the full amount in the Mass Transit Account of the Highway Trust Fund, including the

balance of unobligated funds, annual income and interest;

- o A commitment to new funds equivalent to a seven-cents increase in the federal gasoline tax, or highway user fee.

This degree of funding is necessary to recover the loss of 50 percent in federal transit aid during the 1980s, to repair outdated facilities, replace old vehicles and to expand transit service in the face of growing demand.

An investment of this nature is urgently needed to make mass transportation truly competitive with the private automobile. It will help unclog our roads, clean our air, reduce our dependence on overseas oil stocks and rev the economic engine of prosperity.

To that end, the mass transit community will continue to advance the recommendations of its futures policy group, the Transit 2000 Task Force, within the Administration and Congress, among our coalition partners and the general public.

Trust Fund Balances

Much confusion has developed recently about the "surpluses" that exist in the Highway Trust Fund for both highways and transit. The discussion has prompted recommendations that our investment needs can be met through release of these "surpluses" without the need for increased user fees.

The arithmetic of calculating trust fund balances and surpluses is often confusing, but our analysis and the analysis by the Government Accounting Office (GAO) clearly indicate that whatever balances do exist are totally insufficient to meet our agreed upon investment arguments.

The Administration has recognized the inadequacy of the trust fund balances as a sufficient, long-term funding source. In its recently issued National Transportation Policy report, they state that, " The total uncommitted balances represent significantly less than one year of Federal spending on highways, aviation and transit."

APTA has prepared an assessment of the Trust Fund balances and has submitted a background paper on the issue for the record. We agree, however, that in future years, beginning with reauthorization of the federal surface transportation program, all available revenues in the Trust Fund, including annual receipts, accumulating interest and current balances must be committed fully for the uses they were intended, including transit. To do otherwise would continue to break faith with the nation's tax-

payers who rightfully expect-and need-to see their taxes put to immediate, productive use.

Unfortunately, the Administration's National Policy fails to adequately commit the federal government to this important proposition. Congress must step forward to ensure full use and availability of all Trust Funds revenues as well as immediate increases in the user fees that flow into the Trust Funds.

Incomplete Transit Needs Estimates

In addition to the transit investment requirements contained in the Transit 2000 work, others have sought to estimate the level of federal investment required for transit. Uniformly, however, these estimates fall far below the levels we believe are required. They fail to take into account the full costs of sustaining adequate levels of reinvestment and maintenance of existing services and facilities; they fail to incorporate the substantial costs of implementing new federal requirements including those for reduced emissions and service to the disabled; and, they fail to incorporate investment levels needed to significantly expand transit services and increase the share of travel demand on transit. Most importantly, they fail to take into account that the federal transit program has declined by 50% in real terms over the decade of the 80s.

APTA strongly believes that aggressive goals must be set and adequate resources provided at the levels we have indicated if public transit is to achieve its full potential in addressing actual national goals.

Systems of 'National Significance'

In restructuring federal surface transportation programs, the scope of eligible projects and aid systems logically must be reconsidered. Some transportation interests have advocated precise redefinition of a "system of national significance," particularly to guide the use of federal highway funds.

Great care should be taken in adopting such a concept, however. The transit industry and supporters of increased federal assistance for transit believe that designation of a 'system of national significance' might be unduly influenced by budgetary constraints rather than by transportation needs. One consequence could be a dramatic reduction in the scope of a highway network on which dedicated federal funds could be used. Such a reduction might result in dramatic increases in the street and highway mileage that would be the responsibility of state and local government to finance.

Should state and local financial responsibility be increased dramatically, there could be considerable pressures to ignore essential transit investments in the search for adequate roadway funding. National policy and programs must be crafted in away that does not shift the intergovernmental financing responsibili ty so dramatically that greater unbalance in modal investments is introduced.

A second objectionable feature of the concept of a "system of national significance" is the process by which such a system would be defined and designated. Proponents of such a system suggest that the states and the federal government should establish criteria for system redesignation and act bilaterally to carry out the redesignation, with local and regional officials being subordinate participants in the process.

We believe the process should be reversed, and that local officials, acting through a regional decision-making process, should have primary responsibility for designating elements they believe should be incorporated in any 'national system'. Redesignation of a federal aid system at the local level must reflect the necessary trade-offs on system size and financing that directly serve local goals and reflect state and local financing capacity. State and federal collaboration in this process is obviously needed but should not alone dictate the results. Through such a locally driven process, the resulting regional systems could be combined into a more meaningful 'national system'.

Finally, a 'system of national significance' is often interpretted as an attempt to support major additions to the Interstate Highway System. If this definition is accurate, and federal responsibility and funds are dedicated only to interstate expansion, we will have lost the ability to solve our congestion problem, better manage economic growth and reduce air pollution at the local and regional level. Adequate federal funds must be available <u>across</u> the metropolitan system, not in a limited position of it, if our problems are to be solved.

<u>Matching Levels</u>

Some have advocated substantial reductions in the share of project costs to be met from federal funds. We believe that matching levels should remain unchanged for transit projects, and that the federal matching requirements for both transit and highway projects be equalized to avoid distortions in programming.

Regulations

No statement on reauthorization would be complete without consideration of those administrative requirements that implement authorizing provisions. The regulations of the Urban Mass Transportation Administration (UMTA) are only those of one of at least 12 government agencies that affect the mass transit industry. In addition, UMTA also issues numerous program guidance circulares which govern the day-to-day grant-making activities of UMTA.

Whether issued as a program guidance circular or a "regulation" in the Federal Register, federal requirements are an everyday fact of life in the mass transit industry. More and more regulations are being imposed on the mass transit industry. Congress and the executive agencies issuing these regulations must be aware of the impacts of regulations on local transit properties, especially smaller properties. They frequently increase costs, reduce or restrict revenue raising prospects and restrict ridership growth generally. Many regulations limit the policymaking and administrative discretion of the states and local public bodies in discharging their traditional governmental functions.

In considering the re-authorization of the UMTA program, Congress must ensure that existing regulatory requirements are reviewed and that any new requirements are fully evaluated in terms of cost, revenues and ridership impact so that it can be confident that transit operators throughout the United States are not over-burdened by the regulations to such an extent that they cannot provide essential transit services to their customers.

In issuing regulations, all Federal agencies, and especially UMTA, must carefully provide the affected industry with the opportunity to comment on proposed regulations; and the Federal agencies must give strong consideration to the views of the affected industry when final rules are issued.

APTA will be reviewing the existing regulatory arena affecting transit, and make specific recommendations to this Committee concerning revisions to the statutory framework behind these regulations to ensure that transit can serve its customers in the most effective means possible.

Research and Development

In addition to technologies that can be introduced directly into the transit market, technological innovations that impact the economy, personal lifestyles, and other transportation modes will affect public transit as well. "Smart cars-smart roads"

programs, other communications technologies, and magnetic levitation, along with a host of other emerging technologies may influence or alter travel patterns or the means by which we serve them.

In addressing the prospect and pace of technological innovation, a major issue to be explored in a new national transportation policy is how the research and development process will be directed, monitored, and underwritten. The promise of technological innovation is only as bright as the strength of the commitment to research and development.

Unfortunately, the economic incentive for private suppliers to innovate aggressively on a broad scale for the public transit market is extremely weak. The lack of a strong federal commitment to research and development, the decline and uncertainty in federal transit funding generally, and that fact that domestic suppliers of transit equipment frequently are subsidiary organizations operating under larger corporate umbrellas, means that the transit market often is viewed as high-risk, low payoff, and fraught with uncertainty. These circumstances require a renewed and expanded federal commitment to basic technological, planning and service provision research on behalf of public transportation.

The need for such a commitment extends beyond the usefulness of new technologies to transit operators. The precarious nature of the transit industry as a market for sales of equipment and services has a more far-reaching, negative economic consequence of national proportions-the potential demise of the domestic transit supply industry. In addition to the growing importance of transit, federal support of research and development can be justified to ensure the survival of a vigorous domestic supply industry and the jobs and revenues that industry creates. Stepped-up federal support for basic research and development in partnership with suppliers of equipment and services should be a major feature of a new national transportation policy and program.

A recent report form the Transportation Research Board, entitled, "Research for Public Transit: New Directions," outlines the scope and content of such a program. The recommendations of this report should be used as a blueprint to develop a new federal initiative on transit research and development. The report identifies a number of areas where expanded research will be essential, including human resources, service configuration and marketing, service delivery models, internal efficiencies, maintenance, equipment, and finance.

CONCLUSION

Transportation in the United States is at a key crossroads. The federal highway and transit policies of the 1950s and 1960s essentially have fulfilled their goals. And yet, despite this record of significant accomplishment, we face severe transportation problems in many parts of the country. Worsening congestion is sapping our economies, polluting the air supply, squandering natural resources, and detracting from the overall quality of life.

Today marks the development of an important new generation of national transportation policies that will be forged. These policies will not only influence our ability to restore basic mobility in the future; they also will determine how well or how poorly transportation serves major national goals of economic prosperity and environmental quality.

It is our conclusion that policies and programs at the federal level must be changed and service delivery at the state and regional level must be redefined if we are to preserve and enhance mobility. As a nation, we must make a commitment to reduce our dependence on the automobile and to increase the share of travel demand on convenient high-occupancy, shared-ride services of all kinds.

Towards these ends, the American Public Transit Association and its membership pledge to assist you in the days and months ahead as you shape a new federal strategy for transportation to serve this nation into the twenty-first century.

Rural residents becoming more isolated as public transportation passes them by

First of a series

Oh, what a wonderful world of mass transportation technology awaits in the 21st century, planners tell us.

Wheel-less 200-mph "bullet trains" will whisk between cities, powered by magnetic fields that hold cars to overhead rails. There may even be shuttle rockets to the moon and other planets.

But a stark fact is emerging amid the rosy projections — nearly half the U.S. population is sliding into an isolation greater than that of the early 20th century, when nearly every community of 5,000 or more had rail-passenger service.

Rural Americans, especially the poor, are losing their ability to travel because public and private transit agencies in both prosperous and impoverished states are relegating unprofitable intercity public transportation services to the back burner.

The promise of long-range policy changes seems always just around the corner, but most of the near-term emphasis by state and federal governments is on building wider highways and bigger airports.

Toledoans can fly to most U.S. cities and to the four corners of the earth. But they cannot get to Wauseon, Fostoria, Paulding, or Tiffin by train, bus, or other public transportation.

In the 1950s, most airlines cut out flights to medium-sized cities such as Lima and Marion, O., because they were unprofitable. Although many states, such as Ohio, have subsidized airport construction in rural areas, airlines have not instituted scheduled service there because of high operating costs and few customers.

While 49 per cent of all Americans live in rural areas and small cities, such areas receive less than 10 per cent of transit assistance from the Urban Mass Transit Administration.

▶ Rural areas alone account for 38 per cent of the nation's population, but receive 3.5 per cent of the transit funds, according to UMTA.

▶ Rural motorists pay about 41 per cent of the federal gasoline taxes, but get back 4 per cent in transit aid, according to the U.S. Department of Transportation.

▶ Before the federal and state governments deregulated intercity buses in 1982, more than 16,000 communities had bus service. By last year, service had shrunk by more than a fourth, with buses now serving fewer than 12,000 communities.

When the 42,500-mile interstate highway network is completed in two years, the current Surface Transportation Act will expire. That law says where and how federal highway tax money, now about $12 billion a year, is spent.

Transportation Secretary Samuel Skinner earlier this year set up a series of eight public forums, from Idaho to Maine, to get suggestions for a national transportation policy into the 21st century.

The meetings were part of a process to determine how well the rural transportation systems were serving the public need.

Rural needs prevail

H. Joseph Rhodes, a federal transportation official who headed the meetings, said the 500 or so people who attended showed little interest in intercity transportation, either bus or rail.

"Most of the interest was in getting in from rural areas to urban centers for shopping or social visits. And many smaller communities wanted air service, and only three of four state transportation departments bothered to show up," he said.

Both urban and rural transit agencies will get about $2.2 billion in federal funds this year, down from $2.6 billion in 1987.

The reduction reflects Congressional "sequestering" of about 5 per cent of the money allocated each year so as to make the federal budget deficit appear smaller, according to the American Public Transportation Association. About half the mass transit money comes from fuel-tax proceeds, and the remainder is from the federal general fund.

"The government, somewhat belatedly, has recognized that something must be done," said David Raphael, executive director of Community Transportation Association of America (CTAA), a nonprofit Washington-based consumer alliance.

In setting up meetings in 1988 and this year, the U.S. Transportation Department noted that before 1960 rural families and communities were largely self-sufficient, so transportation played a smaller role.

But this is changing, and rural areas no longer are farming communities. The Agriculture Department's economic research service shows that only about a quarter of the nation's rural counties are dependent on farming. Off-farm income now accounts for 40 to 55 per cent of the average net income of farm households.

Statistics disclose plight in country

How bad is the rural transportation situation in the United States?

According to the Department of Agriculture, Bureau of the Census, and the Urban Mass Transit Administration:

▶ Federal transit funding amounts to about $1 for each rural resident, but it exceeds $28 a person in urban areas such as Toledo.

▶ Thirteen per cent of all American households don't own a car; more than half of the rural poor do not have a car, and nearly 60 per cent of the rural poor are not licensed to drive.

▶ Fewer than 1 per cent of rural residents use public transit to get to work, compared with about 10 per cent of metropolitan residents.

▶ Half the nation's 2,441 rural counties lost population in the 1980s, more than double the rate of loss in the 1970s.

More dependent on autos

Rural areas are far more dependent on automobiles for local transport at a time when the concentration of elderly, poor, and handicapped in these communities is higher than in urban areas, according to Mr. Rhodes.

Rural areas have suffered from the decline of intercity bus and rail passenger service, yet many communities have air service supported through federal subsidies, he added.

The federal transportation department suggests that "the private sector is one possibility for providing a service where there is a need."

This is suggested because budget constraints imposed by the high federal deficit keep federal funding limited. The hearings are aimed at determining where the private sec-

"Congress should redirect mass transit subsidies . . . to address the crisis in rural transportation. Maintaining essential services is a far more cost-effective way than allowing the abandonment to occur and then trying to restart the service after facilities have been closed, equipment sold, and traffic patterns changed."

Ronald Carter, vice president, Antelope Valley Bus, Inc., Lancaster, Calif., at a U.S. Department of Transportation hearing August, 1988.

tor might step in and help, Mr. Rhodes said.

But Ronald Carter, vice president of Antelope Valley Bus, Inc., Lancaster, Calif., said at one of the 1988 hearings, "Maintaining essential services is a far more cost-effective way than allowing the abandonment to occur and then trying to restart the service after facilities have been closed, equipment sold, and traffic patterns changed."

Buried by other problems

Still, political policy makers give public intercity transportation low priorities because of more pressing problems, including the federal deficit, said Charles Lave, chairman of the economics department at the University of California-Irvine.

"Historically, public transportation has been incredibly inefficient, since it covers only about 40 per cent of the cost. In some areas, the policy makers have not written it off, but in most places it has low priority because of the number of people served," Mr. Lave said.

Another problem facing subsidized service is that elected officials fail to separate politics from operations, and government ends up running a wasteful system.

In England, the government decides if bus service to small cities is needed, then accepts bids from private companies. The company that will provide service with the smallest subsidy then runs the business, with no interference from government, Mr. Lave said.

Mr. Rafael said that rural transportation is "only seeking equity with other forms of transportation for public support."

CTAA was formed last [illegible] through the merger of Rur[illegible]eri-ca and the National Association for Transportation Alternatives, two organizations advocating for transportation

Air transport favored

The government, through airport construction funds and maintenance of the air traffic control system, is subsidizing airlines. Air travel jumped dramatically after the 1978 deregulation of the industry.

But the government provided no extra money to help rural communities hang on to intercity transportation after the bus industry was deregulated in 1982, Mr. Rafael said.

"What good does it do to build a new highway into a community if half the people who live there can't use it?," he asked.

Areas hit hardest by loss of intercity transportation in Ohio and other states surveyed have two things in common.

They are off the interstate highway network and have unemployment rates higher than the national average. Some are pockets of poverty, but others are prosperous and have existed for years without public transportation.

Western states have been hard hit, especially Kansas, Nebraska, the Dakotas, and Colorado. The entire northeastern third of Missouri, a large chunk of western Illinois, southeastern Kentucky, and southern West Virginia have lost all passenger service.

CTAA researchers have found that in some areas without transportation, families are under strain, Mr. Raphael said.

"People become dependent upon relatives with cars, and this means they must live with them, or near enough to get some help."

THE BLADE

TOLEDO, OHIO, TUESDAY, DECEMBER 28, 1982

With no way in, out, thousands just get accustomed to isolation

OTTAWA, O. — Adolfo Flores stands near a harvested cornfield along State Rt. 613, waiting for a ride.

He says he is going to Defiance, O., and a cousin was supposed to pick him up at 9 a.m. It's now near 10, and he's trying to hitch a ride.

Mr. Flores, 23, of West Leipsic, has no car. His possessions are in a worn shopping bag.

"I will try to find work in Defiance. If no luck, I will go home to my sister's [in San Benito, Tex.] for the winter. I will be back next summer," he said.

No other way in, out

Unless Mr. Flores, a farm worker, can buy a car, he will have to hitchhike back to Putnam County next year. There is no other way to get in or out.

Putnam County, a prosperous farm-industrial county about 60 miles south of Toledo, has no intercity transportation and hasn't had any since passenger trains quit running in 1971.

More than 233,000 people in six northwestern Ohio counties are in similar straits. Fulton, Paulding, Seneca, Crawford, and Mercer counties also have no intercity transportation. Three other counties — Ottawa, Sandusky, and Huron — depend on an on-demand van service connecting with Greyhound buses in Sandusky. Two others, Hardin and Van Wert, have just one bus a day.

Similar pockets of isolation exist around Ohio, since 32 of 88 counties have no intercity transportation.

Other states have similar areas with no public intercity transportation, according to Brenda Rice, rural transit coordinator for the Community Transportation Association of America.

Areas widening

"Thousands of communities have lost and are continuing to lose service. It's not quite as bad as a decade ago, but the areas are still widening."

Thousands of square miles in Missouri, Kansas, Nebraska, Colorado, western Illinois, the Dakotas, Idaho, Wyoming, and West Virginia have "huge gaps in their transportation systems," Ms. Rice said.

The problem is not confined to the West. Upper New York, Maine, and northern Pennsylvania are without intercity transportation, she added.

It is not that Ohio has no transit agencies. The state has 21 urban area systems comparable to the Toledo Area Regional Transit Authority and 35 intracounty and rural systems. Add to this 265 nonprofit elderly and disabled service providers, chiefly churches and social-service agencies.

But these agencies cannot cross county lines because of government regulations, and only the elderly and handicapped can use them.

With the easy availability of $300 used automobiles and years of reliance on the highways, "there just isn't much of a need" for intercity transportation, Richard Edelbrock, Ottawa mayor, said.

"People have become too mobile today," he said.

Transportation for the elderly and handicapped is provided by the county council on aging through a contract with the county office of human services. There is a big need for transportation for people who are over 60 or handicapped, but few requests for out-of-county travel, Morris Vander Embse, human services director, said.

If a person needs out-of-county transportation for medical purposes, the county can pay 20 cents a mile in expenses to a friend or relative, Diane Chamberlin, the department's transportation coordinator, said.

Mel Arthur, head of the Putnam County office on aging, said the lift-equipped and regular vans average about 50,000 miles a year carrying seniors and handicapped on shopping trips and to medical appointments.

"There is a need, especially if you are under 60 and cannot drive for one reason or another. Autos are fine, as long as you can drive one," he said.

The agency receives very few calls for transportation help from needy people, and it turns those over to social service agencies such as the Salvation Army.

In neighboring Paulding County, the least-populated in the area, the last bus pulled out for good almost 35 years ago.

Mary Lou Cramer said her father, Paul, drove the daily roundtrip from Paulding into Fort Wayne, Ind., several years. He died in 1953, and the owner kept the service another two years, she said.

"It stopped at all the small towns between here and Fort Wayne. You had to go to Fort Wayne to get anywhere," she said.

The last train through Paulding between Jackson, Mich., and Cincinnati quit shortly after World War II.

Paulding Mayor Vera Miles said people in the village of 2,500 have grown used to isolation.

"They know from birth that if you don't have a car, you don't leave town," she said.

The county has no taxi service, and anyone needing to get somewhere usually depends on friends or relatives, she said.

Bus/rail service available in N.W. Ohio

At the county human services office, Director Sally Gross said transportation for the noneldery and able-bodied "is definitely a problem."

The department contracts with the Paulding County Senior Center to provide transportation for those over 60, but if someone not qualified needs help, "we have to seek a private donation."

One local auto dealer, active in the Salvation Army and who wanted to remain anonymous, said stranded travelers and families are given financial help to get to their destination. But such requests are rare, he said.

Tiffin in Seneca County (population 19,000) and neighboring Fostoria (population 15,700) are the largest cities in the area without intercity transportation. Rail passenger service ended in 1971; the buses left in 1983.

Tiffin has adjusted to the loss of service because it is a small town and "people here are used to helping each other," Mayor David Martien said.

Heidelberg College and Tiffin University, with a combined enrollment of more than 1,800, have also had to adapt.

Bob Olson, Heidelberg's vice president for student services, said two vans take out-of-state students to airports in Columbus and Cleveland before breaks. Most students have access to a car, he said.

About 35 students are bussed to Cleveland and 25 to Columbus, with the college paying for the service. Students also make use of a "ride board" in college buildings, where ride availability and needs are posted.

"There is some difficulty in being without public transportation. Our Japanese students, in particular, are amazed when they find out we don't have any," he said.

Tiffin University often provides transportation to campus for new students without cars and then works to find them rides home when needed, Geoff Schott, public information spokesman, said. "They make friends and soon have some way to get around," he said.

Service Cab Co. in Tiffin gets about two calls a month to take someone to the nearest bus station, Wayne Radebaugh, a dispatcher, said. College students use cabs to get to Toledo sometimes. It costs $65 a cab to Toledo Express Airport.

Cabs also take passengers to Findlay, the nearest city with bus service, Robert Ottler, cab company owner, said. He charges $35, but the service is not a money-maker because he cannot carry anyone back.

"Buses are not the answer for a city this size. You have to get government approval, millions in liability insurance, and there is not enough demand for it," he said.

Transportation outside Seneca County for people not eligible for handicapped or elderly service is usually provided by family or friends, Jennifer Mains, director of the county office on aging, said.

"If we look hard enough, something will come up," she said.

THE BLADE

TOLEDO, OHIO, WEDNESDAY, DECEMBER 27,

2 states a world apart in public mass transit

FLINT, Mich. — A state line and 100 miles can make a big difference in public transportation.

A passenger arriving on the daily Amtrak/VIA "International" from Chicago or Toronto steps off into a new rail station. A Flint Mass Transit Authority bus waits outside to take passengers a few blocks downtown to a new, $4 million glass and aluminum bus station, which serves both transit and intercity bus riders.

From there, you can catch a bus to anywhere in Genesee County or to any city in Michigan and other states via Greyhound and Indian Trails lines.

Both stations opened in June and are in sharp contrast to what exists in Toledo. In Toledo, a passenger leaves a train at Conrail's Central Union Terminal and walks about 300 feet past peeling paint and rusting platforms up one floor, then another 300 feet through the nearly deserted station to the driveway in front of the station at 415 Emerald Ave.

TARTA buses used to stop there, but service was discontinued several years ago because no one was using it. The nearest bus stop is a block away on Broadway, over crumbling sidewalks and past the abandoned former Page Dairy Co., a haven for transients.

There is no sign at the Amtrak station directing passengers to either TARTA buses or the Greyhound station. The bus station is either a one-mile walk or a $4 to $5 cab ride away.

The difference between the two cities?

Money.

Michigan spends it on subsidizing Amtrak trains, intercity buses, and new and improved tracks and stations.

Ohio does not.

Michigan is light years ahead of Ohio in establishing local and rural agencies. Eighty-one of its 83 counties have some form of public transportation, and 56 have countywide transportation systems.

"Michigan is the premier state when it comes to supporting intercity service," said David Highsmith,

executive director of the Community Transportation Association of America, a national organization coordinating efforts to improve access to rural areas.

Michigan last year spent $161 million on nonhighway projects; Ohio spent $54.9 million. Unlike Ohio, Michigan used fuel tax revenue (about $90 million), plus another $35 million from state sales taxes and other tax sources.

Michigan spent about $1 million last year subsidizing Amtrak service, $2.3 million on intercity bus service, and another $3.3 million to build or renovate bus stations.

Ohio spent nothing.

All major Michigan cities have at least one Amtrak train daily; two trains and an extra weekend run link Chicago with Kalamazoo, Battle Creek, Jackson, Ann Arbor, Dearborn, and Detroit. One of the trains continues on to Toledo.

Columbus, Ohio's capital and largest city, doesn't have rail passenger service. Dayton, Akron, and Youngstown don't, either. Toledo and Cleveland have one train a day, and Cincinnati is served by an every-other-day train between Chicago and Washington.

The new Flint bus-transit station is an airy, attractive building designed to attract people, not merely serve existing business, said Robert Foy, Flint's metro transit director.

Moving in soon will be a doughnut shop, a newsstand, and a police substation. Bus tickets or transit tokens also are sold there.

Passenger volume rising

Mr. Foy said about 11,000 people use the station daily, and bus ridership has risen 13 per cent since it opened.

In Kalamazoo, Albion, and Battle Creek, Amtrak stations also serve both intercity and local transit buses. Work has begun to combine bus-transit-train facilities in Ann Arbor — perhaps next year — and in Jackson, Grand Rapids, and Port Huron later, said Scott Hertig, rail passenger director for the Michigan department of transportation.

Michigan's involvement with intercity bus transportation dates to the late 1970s, when a loan pool was created for carriers to buy buses at low interest rates, said Jerome Rudnick, administrator of the Michigan transportation department's intercity bus division.

"We lost 31 per cent of our intercity bus service after bus deregulation in 1982. We stepped in to subsidize some lines, to help out until new operators could be found," Mr. Rudnick said.

Greyhound split off many routes to private operators. Today, only the Bay City-Alpena line is subsidized at a cost of about $92,000 a year. It is the only bus route along the eastern part of the state.

Funds for subsidies and capital improvements come from state gas tax revenue.

Improvements under way

Both Amtrak and the state have embarked upon a major rebuilding of the Detroit-Chicago corridor, including installation of warning lights and other improvements at 143 crossings. Mr. Hertig said the state plans to have lights at every crossing along the 246 miles of the corridor in Michigan.

Ridership has decreased along the corridor for nearly three years because a massive rail-replacement and roadway-rebuilding project made the trains late most of the time. Amtrak owns the western 100 miles; Conrail has the remainder.

But with most work completed, business is coming back, Mr. Herzig said. When track work is completed, trains can operate at speeds of up to 80 mph, cutting substantial time off Chicago-Detroit trips, he said.

About 500,000 passengers a year use Amtrak trains in Michigan, compared with 100,000 during the first two years the system operated, Mr. Herzig said.

Michigan, like Ohio and other eastern and midwestern states, is part of a high-speed rail compact aimed at developing 100-mph-plus train service between Chicago and the east coast over the next two decades.

But Mr. Herzig said Michigan years ago embraced the idea of a balanced system, funding conventional service until a more futuristic system is developed.

Michigan is one of eight states that get extra Amtrak service by paying 50 to 75 per cent of train costs. New York, Pennsylvania, Illinois, Missouri, California, Wisconsin, and Alabama do, also.

Michigan's department of transportation also promotes Amtrak service as an alternative for motorists by posting representatives at rest areas on interstate highways. Two of them were at the I-75 rest area in Monroe County earlier this month.

"We did a questionnaire at the Lansing rest area, and 50 per cent of the people interviewed didn't even know Michigan had passenger trains," Mr. Herzig said.

Michigan also has committed up to $200,000 in federal money to start up and promote Greyhound's "rural connection" with county transit agencies. So far, seven counties provide the service, and others may be added, Mr. Rudnick said.

In Ohio, only one publicly supported bus agency provides connector service, and a private operator is maintaining an on-demand service to a three-county area around Sandusky.

Jackson County, Michigan, 60 miles northwest of Toledo, has had a successful Greyhound connector line since September, 1988. It is operated by the Jackson Transportation Authority, a publicly supported agency.

Gordon Szlachetka, general manager, said the Greyhound connector has been averaging 80 runs a month.

Anyone in Jackson County needing transportation to or from the Greyhound station may call 24 hours in advance for a bus or van ride, Mr. Szlachetka said. Requests are handled on a first-come, first-served basis.

Fares range from $1.50 to $2 for the connector service.

JTA, like the Toledo Area Regional Transit Authority, does not serve all the county because not all governmental units support it.

Earmarked state funds allow the agency to participate in the Greyhound connector program, Mr. Szlachetka said.

Michigan's biggest bus project is to be completed by the fall of 1991: a $5.9 million Greyhound terminal at Sixth and Howard streets in downtown Detroit. Under the agreement, the bus company will rent the building and guarantee bus service for the next 20 years.

Next: Amtrak — sick with success.

Stations in Albion and Flint (below) serve both bus and train passengers

A world apart

THE BLADE

TOLEDO, OHIO, FRIDAY, DECEMBER 29 1989

Already isolated, West Virginia town prepares for life without bus service

WELCH, W. Va. — Driver Don Hambrick eases the big Greyhound bus around a sharp curve on U.S. 52. The tires make a squishing sound in the rain.

The valley of Elkhorn Creek in southwestern West Virginia hums with activity. Heavy trucks and cars crowd the two-lane highway, and up to 50 Norfolk & Western trains rumble through each day, carrying millions of tons of West Virginia coal to Tidewater docks.

But the Appalachian Mountains push in on all sides, giving the valley a sense of isolation that will soon become real.

This is the only bus into the valley, and on Jan. 3, Greyhound will end the route. The company said only 112 people rode the bus last year, and the entire run, from Roanoke, Va., to Welch, is being dropped because it is losing thousands of dollars a year.

When the bus leaves for good, McDowell County (pop. 40,000) and the 4,600 people of Welch will have no way to get to the outside world by public transit. Greyhound will retain buses to the larger cities of Princeton and Bluefield, about 35 miles away.

"These people are the finest in the world. They don't deserve this," Mr. Hambrick, a driver since 1961, says.

Aboard the bus this day are six passengers. Larry Bryant and Mildred Crozier and her two children, Wayne, 3, and Darnell, 5, are on the last leg of a bus ride back home from Seattle. Albert Mullens of Roanoke, is on his way to visit his sister in Welch, and Addie Wallace, from Columbia, S.C., is en route to see relatives in Gary, W. Va.

The bus arrives in Welch, a town squeezed into a narrow valley. The dilapidated Trailways station is on a street so skinny that Mr. Hambrick has to turn the bus and back in.

McDowell County has been hard hit in recent years. Its population was 100,000 in 1950, but automation and lower levels of coal production have decimated the work force.

Unemployment last month was 16.1 per cent, the highest in the state. Its welfare case load of 2,400 families is the second highest in the state.

"With this kind of economic situation, people obviously don't travel very much," said Louie Palmer, state human services division director for McDowell and neighboring Wyoming County.

People needing transportation usually rely on family or friends with cars. There is no taxi service in Welch, and the state sometimes pays private drivers 17 cents a mile to take the county's elderly or sick people to a state-supported clinic in Welch or hospitals in Bluefield and Princeton.

The bus passes through once-thriving towns, now boarded up and decaying. Houses cling to the sides of the wounded and scarred mountains. Bramwell, Maybeury, Northfork, Keystone, and Kimball. Trailways (taken over by Greyhound in 1987) once had five or six runs daily through here that went all the way to Huntington on the Ohio River. They gradually were cut back until only this one remained.

The cutbacks are at odds with a pledge made by Fred Currey, Greyhound chairman, when his company bought Trailways in 1987:

"The Greyhound acquisition of Trailways will guarantee continuance of bus service to the cities and towns served by Trailways. It will save jobs and it will improve service."

Company's totals questioned

Mr. Hambrick challenged figures Greyhound used to determine that the line loses money.

"There aren't many on the bus today, but on the entire run, there are at least an average of 22 people that use it," he said.

Public hearings were held by regulatory agencies in both states last year. At a nine-hour hearing July 7 in Welch, citizens and virtually every public agency in the area told of the need for the bus.

At a hearing in September in Roanoke, riders, public agencies, and officials of Virginia Tech University in Blacksburg, Va., testified that the bus is needed. It is the only bus serving the university's 24,000 students.

However, the West Virginia Public Service Commission approved the discontinuance of service in October and the Virginia Corporation Commission approved it Nov. 16.

Had the states turned down the request, Greyhound could have appealed to the Interstate Commerce Commission. But under the 1982 bus deregulation act, the public cannot appeal to the ICC.

Mayor sees dim prospects

Across the street from the soon-to-be-vacant bus station, in the city hall — one of the few new buildings in town — Mayor Martha Moore is asked if there is any public agency or private firm willing to step in and take over public transportation.

"Look around. Do you see any way this town can come up with the money?" she replied.

Mrs. Moore said she thinks Greyhound has tried to discourage passengers since it took over the Trailways line.

"Look at the schedule. The bus comes over here in the morning and goes right back. They should have it going into Bluefield in the morning and coming back in the afternoon. Then people would use it," she said.

Back at the station, a solitary man sits in the waiting room, smiling, holding a white cane in both hands.

Mary Cox, who manages the station as an independent contractor, also challenged Greyhound figures. She has sold $37,000 worth of tickets and express business so far this year. When Greyhound had two buses, business was about $100,000 a year, she said.

But Randy Isaacs, a Greyhound spokesman in Nashville, Tenn., said that since 1982, when the government deregulated buses, only income from cities along the local bus route has been been counted as revenue.

If Mrs. Cox sold a ticket from Welch to a city in California, only the $5.50 fare to Princeton would be counted as revenue, he said.

It is time for the bus to leave. No one was there to meet Mr. Mullens, so he reboards the bus back to Roanoke. A mother and daughter get on for the trip to Keystone.

What about the man in the waiting room?

Mr. Hambrick says he is Calip Giles. A former coal miner blinded in an accident, he comes down to the station each day.

"He just likes to hear the sound of different voices. I wonder what he's going to do when the bus doesn't come any more."

Next: A ray of hope in the Potomac Valley.

Loss of bus will be costly

Black map by Larry Gorman

Rail, bus, air: a brief look

AMTRAK — Serves 500 communities; has 220 daily trains; carried 21.34 million passengers in 1988; had revenues of $1.25 billion; current federal subsidy is $615 million, including $85 million in capital improvements.

GREYHOUND — Serves 10,000 communities; has 3,949 buses; 1988 revenues totaled more than $923 million; 1988 net loss was $17.3 million.

U.S. AIRLINES — Serve 477 cities; 1988 operating revenues were $64.5 billion; operating profit, $3.4 billion; annual federal subsidy (airport construction, air traffic control system), $4.8 billion.

West Virginia's intercity transportation vanishing

West Virginia's intercity transportation system could best be described as a basket case.

That is not surprising in a state whose economy has been devastated by a shrinking market for Appalachian coal due to inroads made by lower-sulfur coal from western states into the once-exclusive markets that included many Great Lakes electric utilities.

As a result, West Virginia has been losing population and subsequently, its transportation system.

Because of mountainous terrain, only two interstate highways — I-77 and I-64 actually cross the state.

I-77 runs south from Parkersburg — across the Ohio River from Marietta, O. — to Bluefield, W. Va., and the Virginia border.

I-64, completed only two years ago, slants across the southern part of the state, roughly from Huntington east to Charleston, the state capital, then south and east to White Sulphur Springs, on the Virginia border northeast of Roanoke.

I-79, the only other interstate in West Virginia, runs only from Charleston north to Morgantown and then to Pittsburgh.

There is no interstate highway across the state's northern section, except where I-70 crosses the narrow panhandle to connect Ohio with southwestern Pennsylvania.

Before Amtrak's formation in 1971, three railroads operated daily passenger trains through the state.

Today, service is limited to one train every other day, linking Charleston and Huntington with Washington and Chicago. This service is threatened by CSX Transportation's plans to abandon track in Virginia that provides access to Washington.

Eighty-seven West Virginia communities lost bus service in the four years following bus deregulation in 1982. Today, Greyhound buses generally follow the interstate system.

The federal government subsidizes airlines that fly into Clarksburg, Elkins, Morgantown, and Bluefield/Princeton. The subsidies last year cost $1.2 million and averaged $166 per passenger at Elkins in north-central West Virginia.

The state has only four urban mass transit systems, and therefore is shortchanged in getting federal aid. It gets back less than 10 per cent of money it sends to Washington from the 1-cent gas tax allocated for mass transit.

— HANK HARVEY

The waiting room at the Greyhound station in Welch, W.Va., is empty except for Calip Giles, a handicapped man who visits the station daily

THE BLADE

TOLEDO, OHIO, SATURDAY, DECEMBER 30, 1989

Bus service on hard road in highlands

YOU CAN'T GET THERE FROM HERE

DAY SIX

PETERSBURG, W.Va. — Here in the scenic Potomac River highlands, a small transportation agency is struggling to hold together the only public bus service in one of the most isolated areas east of the Mississippi River.

The Potomac Valley Transit Authority was one of the first federally funded efforts in rural transportation, and the agency's 20 small buses zip up and down narrow two-lane roads in five counties, taking people to work, hospitals, and doctors' offices, shopping centers, and housing developments.

Since Sept. 1, the buses have had a new role: crossing into adjoining Maryland and Virginia to take people to and from cities where Greyhound buses still run.

The Highlands, as it is known, is fairly prosperous compared with the worn-out coal fields in southeastern West Virginia, the Mountain State. But only 70,000 people live in its valleys and along the sides of the 3,000-foot-high Appalachian ridges that run north and south.

Without the transit authority, there would be no public transportation in an area nearly as big as the part of Ohio that lies west of I-75 between Toledo and Cincinnati.

J. Douglas Carter, a native of Pemberville, O., director of the system since 1977, says it is getting tougher to keep the rural network together.

Mr. Carter, 42, who has a degree in sociology, became interested in transit operations while driving a campus bus at Kent State University.

"Costs keep going up, and there is a continuing problem of lack of money or any assurance of a long-range federal program to keep us going," he said.

The state formed Potomac Valley in 1977 as part of an effort to cover the entire state with 11 transit authorities. But the plan was cut back to four districts a year later when the state's economy took a nose-dive and revenue plunged. Changes in state administrations also brought shifts of direction for the program, Mr. Carter said.

It costs $420,000 a year to run the system. Forty per cent comes from the federal government, 35 per cent from the state, 20 per cent from fares, and 5 per cent from Mineral, Hampshire, Grant, Hardy, and Pendleton counties. The authority is run by a board of trustees from the counties.

Coming up with more local funding has been especially difficult because of the area's low tax base and the phase-out of federal revenue sharing a few years ago. Forty-five per cent of Pendleton County, the second poorest in the state, is owned by the federal government. Most of the federal property is in national forest land.

And all nonschool tax issues in West Virginia require 60 per cent voter approval.

Potomac Valley ridership is declining. In 1980, its buses ran 600,000 miles. Mr. Carter estimates they will travel about 380,000 miles in 1990. Several small factories have c[illegible] and gasoline prices have dropped.

But Mr. Carter hopes to turn things around through a combination of marketing and the Greyhound rural connection program.

Greyhound stopped running buses through the area after a drivers strike in 1983. The Potomac Valley Transit Authority then received Interstate Commerce Commission approval to operate from West Virginia to Greyhound stations in Virginia and Maryland.

The authority also added bus runs within its own service area — either weekly or thrice weekly — to replace the loss of Greyhound's local service.

Use of the Greyhound rural connection has been limited so far; only a handful of people used the service in September and October. But passenger volume is expected to build and provide income through ticket sales. Greyhound pays the authority $1.50 to $3 for each ticket the agency sells to and from Greyhound terminals.

Promotion of the service is difficult because the area has only two radio stations, one daily newspaper, and four weeklies, Mr. Carter said.

"Mass transit in this area is still basically thought of as being exclusively for the old and poor. We really need to attract the 35-to-50-year-old rider," he said.

Buses run in the morning from outlying areas into towns of Keyser, Romney, Petersburg, Cumberland, and Winchester and return in the evening. PVTA transports about 100 out of 600 plant workers to and from Hanover Shoe Co. about 32 miles south of Petersburg.

Fares are 60 cents for first 5 miles, and 5 cents a mile beyond that. Senior citizens and the handicapped pay half fare.

On an afternoon run from Keyser over the Potomac River to a Cumberland, Md., shopping center, driver Sandy Batten had only three passengers. Two were employees of a sheltered workshop near Keyser.

At the shopping mall, 11 people got on for the 25-minute run back to Keyser. All were elderly. Mr. Carter said the transit agency is allowed to provide local service across the state line between Keyser and Cumberland, which is just across the river from West Virginia.

One woman said she could ask a neighbor for a ride but did not want to be a bother.

"People in these parts are independent, but they also worry about taking the bus and getting stranded. Some feel is it better to just stay home than get stranded. But we haven't left anyone yet," Mr. Carter said.

Blade photo by Don Strayer

Greyhound agent Lee Wood shovels snow outside Sandusky station

Lack of public funding said to deter bus service

Greyhound's 2-year-old "rural connection" program has helped public agencies establish 75 connecting services in 20 states, but a program of involving independent entrepreneurs is lagging.

Randy Isaacs, who heads Greyhound's effort from an office in Nashville, Tenn., said the connection has involved 75 county or regional agencies, similar to the Potomac Valley Transit Authority in West Virginia, in maintaining service from rural areas to the nearest Greyhound stations.

These public agencies, aided by state and federal funds, also can provide Greyhound package service. Greyhound's participation extends to allowing the local agencies to use its depots, ticketing facilities, and a listing in Russell's Official Bus Guide of all U.S. and Canadian bus schedules.

Ohio has not shown much interest in the rural connection program, Mr. Isaacs said. Only the Muskingum Authority of Public Transit in Zanesville, which started three months ago, has signed up for it.

And only four private Greyhound shuttle services have been launched in the country, although two others are expected to begin operating soon, Mr. Isaacs said. Such operations generally are not eligible for public funds.

Two van services tried

In Ohio, two Greyhound station agents have tried van service between outlying areas and a bus terminal. One is still in business; the other shut down in September.

Lee Wood, Greyhound agent in Sandusky, started Arrow Express about two years ago, linking Sandusky with Fremont, Bellevue, Clyde, Norwalk, and Port Clinton. He was denied special entrepreneurial funds from the federal Urban Mass Transit Agency because he established the service before asking for the money.

"We're still hanging in and breaking even," he said.

Jack Dyer, Greyhound agent in Youngstown, dropped a money-losing van service to Hubbard, O., and Sharon and Mercer, Pa., after a year.

"Not enough business. We charged $4 for a 28-mile trip, and there was never enough income," he said.

Mr. Dyer did not apply for state or federal money. "There was too much red tape, and they tied your hands," he said.

Government funds lacking

Federal regulations are aimed at discouraging new bus operators, Mr. Dyer said. The Interstate Commerce Commission required that he obtain $1.5 million in liability insurance. Premiums cost $5,000 a year, and he did not have one claim during the year, he said.

Brenda Rice, rural transit coordinator for the Community Transportation Association of America, said rural connection programs are spreading gradually, but a big drawback is lack of government funds to extend connections on a regional basis.

CTAA is setting up connector services in Arkansas, Kentucky, Tennessee, Mississippi, and some other states through rural public transit agencies. But most of these are limited to one county, she said.

"If any program is to be successful, it must have citizen involvement on the local level first. Then they have to get across the message that government must share some of the responsibility for providing transportation," Ms. Rice said.

GENERAL RESOLUTIONS SUBMITTED TO THE
49th CONVENTION OF THE AMALGAMATED TRANIST UNION
ANAHEIM, CALIFORNIA - SEPTEMBER 18-22, 1989

RESOLUTION A

Submitted by Amalgamated Transit Union

Mass Transit Policy

WHEREAS, a strong, dynamic and well funded federal mass transportation program, operated in partnership with state and local governments is essential to advancing our country's economic growth and prosperity, improving its air quality, and providing mobility for all citizens; and

WHEREAS, effective mass transportation services enables us as a nation to respond to our growing traffic congestion and energy conservation problems, while expanded investment in our transportation infrastructure provides the underpinning for increasing industrial competitiveness and improving our urban and rural areas responses to social and other related concerns; and

WHEREAS, to achieve these national goals we must reverse the radical and destructive mass transportation policies of the Reagan Administration implemented over the last eight years which have resulted in significant reductions exceeding 50% in federal transit funding; and

WHEREAS, the U.S. Congress and the Federal Department of Transportation are seeking to define a new national transportation policy for the 1990's and beyond through a consensus among a broad coalition of both business and labor leaders, legislators and public officials, environmentalists and other representatives of society who benefit from improved transportation; and

WHEREAS, this consensus must be based on recognizing the mutual needs of all who provide as well as benefit from transportation services, and thereby reject the policies pursued by the Reagan Administration designed to undermine collective bargaining job rights and employee protection guarantees to transit workers; and

WHEREAS, we are opposed to a federal transit policy advocating an increased competitive environment and the periodic rebidding of transit services, which has the effect of only encouraging the transfer of jobs and services from union to nonunion, low waged rated companies, thereby undercutting the living standards and economic security of thousands of workers throughout the industry; and

WHEREAS, a newly defined federal mass transportation policy should encompass legislation ending long standing efforts within the U.S. Transportation and Labor Departments to weaken the collective bargaining and negotiation rights of workers in the transit industry, especially in such areas as job preservation guarantees, first opportunity of employment in new jobs and restrictions upon subcontracting of bargaining unit work; and

WHEREAS, these and other rights guaranteed to transit industry workers for over twenty five years under Section 13(C) of the original Urban Mass Transportation Act must remain at the heart of the consensus among labor and industry representatives and other organizations as they fashion their new transportation policies; and

WHEREAS, the basis for strengthening the existing federal urban mass transportation program should remain the structure recently reaffirmed under Title III of the Surface Transportation and Uniform Relocation Assistance Act of 1987 (H.R. 2), known as the Federal Mass Transportation Act of 1987; and

WHEREAS, a sound national transportation policy should have as its goal to increase transit ridership by at least 50% in the 1990's and to keep fares at reasonable levels so as to provide a safe efficient reliable means of mobility for the millions of Americans who are dependent upon mass transportation; and

WHEREAS, the Congress in reauthorizing the federal program in 1987 reaffirmed the allocation of one-cent of the federal motor fuel tax for mass transportation services, but held total authorized program levels through fiscal year 1990 to approximately $4 billion when annual industry needs actually exceed $6 billion annually;

THEREFORE BE IT RESOLVED, that the ATU participate in designing a strengthened National Transportation policy for the 1990's and support Federal legislation designed to increase funding for both operating and capital assistance in legislation essentially comparable to the 1987 Federal Mass Transportation Act, including at least $6 billion dollars annually in federal subsidies; and

BE IT FURTHER RESOLVED, that the ATU express support for proposals to increase existing Federal highway user fees, i.e., federal gasoline taxes earmarked for public transportation and placed in the Mass Transportation Account of the Highway Trust Fund, with the condition that such revenues should be used to supplement and not substitute for the general revenue funding portions of the federal transportation program; and

FURTHER BE IT RESOLVED, that the ATU inform Congress that any program of expanded federal aid for mass transit must be premised on the continuation of collective bargaining rights and the preservation of a free collective bargaining process on all

mandatory subjects of bargaining, based on the right to strike or the use of arbitration to settle unresolved disputes; and

FURTHER BE IT RESOLVED, that the ATU undertake appropriate legislative and political efforts to insure that the policies and procedures for administration of the Section 13(c) employee protection provisions under the Federal Urban Mass Transportation Act in effect prior to the unwarranted changes either implemented or proposed by the Reagan and Bush Administrations be reaffirmed in the interest of affected employees; and that Congress reject and set aside any proposals for adverse changes in Section 13(c) policies and procedures; and

FURTHER BE IT RESOLVED, that the ATU inform Congress that the labor protection provisions of the Urban Mass Transportation Act should not be transferred to the Department of Transportation, but must remain the exclusive responsibility of the Department of Labor; and

FURTHER BE IT RESOLVED, that the ATU undertake efforts to insure that the Congress maintain provisions guaranteeing that labor standards including the payment of prevailing wages to all workers engaged in the construction or operation of mass transportation facilities involving federal financial assistance, and that such standards also guarantee to rail and transit workers the first opportunities of employment arising from federal transit funding; and

FINALLY, BE IT RESOLVED, that the ATU insure that new authorizing legislation include provisions to recognize that decisions about private sector participation in transportation including decisions to employ competitive bidding, privatization or subcontracting with private operators, if warranted, should be made at the state and/or local level free from any federally imposed standards, guidelines, policies or grant conditions; and that private sector involvement in public transportation remain a local decision to be employed only when such service is complementary to the existing public transit network and only where there can be a partnership of public and private providers protective of employee interests and the riding public.

RESOLUTION B

Submitted by Amalgamated Transit Union

Privatization of Public Mass Transportation Services

WHEREAS, the governments of the United States and Canada, reflecting a worldwide conservative anti-labor trend are instituting policies and programs to "privatize" essential public services, including public mass transit operations; and

WHEREAS, these anti-labor privatization policies and competitive service solutions place in jeopardy thousands of ATU members' jobs and livelihood; and

WHEREAS, in Canada, certain segments of the transit industry are pressuring city governments and transit systems to increase the level of privatization of public mass transportation services; and

WHEREAS, The U.S. Department of Transportation through a series of Urban Mass Transportation Administration policies and guidelines is compelling transit grant recipients to competitively bid or privatize new and/or existing transit services as a condition for the receipt of federal transit aid; and

WHEREAS, the U.S. Department of Transportation through its privatization initiatives is intruding into the local transit planning and decision making process, as to the choice of public or private providers of mass transit services, thereby violating the long standing federal policy of neutrality as to the choice of service providers; and

WHEREAS, such privatization initiatives will only lead to the dismantling and fragmentation of regional transit services, which are better suited to providing high quality, safe and effective service while meeting the public's broad based community transit needs; and

WHEREAS, the U.S. Department of Transportation through its privatization program is advocating the use of private operators paying cut-rate wages and benefits under the misguided belief that such operators can produce long term savings while maintaining reasonable service; and

WHEREAS, the alleged cost savings from privatization are overstated, and often non-existent when the full cost of service is taken into account, including the continuation of high quality maintenance, safety and service standards, contract administration and other overhead costs; and

WHEREAS, using private firms to deliver public transit services often results in higher cost and reduced quality and efficiency of services, accompanied by an unresponsiveness to public service needs and inadequate public control mechanisms and;

WHEREAS, historically the private sector has failed in its mission to provide long term quality service;

THEREFORE BE IT RESOLVED, that the ATU oppose Congressional and U.S. Department of Transportation efforts to condition, delay or prioritize transit grants to applicants based on the extent or amount of service provided by private transit operators; and

FURTHER BE IT RESOLVED, that the ATU oppose Canadian transit industry and government policies favoring increased privatization of public mass transit services; and

FURTHER BE IT RESOLVED, that the ATU support the negotiation of collective bargaining provisions limiting the right of transit agencies to contract work to private non-union operators, in a manner which causes job losses and otherwise interferes with existing collective bargaining rights and obligations; and

FURTHER BE IT RESOLVED, that ATU locals work with their local transit planning and decision makers to ensure that decisions involving the integration of private operators in the provision of public transit services are designed to meet local transit needs in a manner which protects our members' jobs and collective bargaining rights; and

FURTHER BE IT RESOLVED, that the ATU distribute the recently completed EPI privatization study entitled "The Emperor's New Clothes: Transit Privatization and Public Policy" to all local unions with any additional information necessary for use in combatting federal and state legislation or local policy initiatives to privatize, or to competitively bid public transit services; and

FURTHER BE IT RESOLVED, that the ATU will launch a national campaign to work with its local unions, state and regional conference boards to develop the necessary information, tactics, publicity campaigns, lobbying, educational/conference/workshop activities, coalitions, and legislation to use in opposition to privatization and/or competitive bidding proposals involving public transit services.

AFL-CIO

RESOLUTIONS

Numbers 1 to 222

Eighteenth Convention

1989

Resolution No. 18
Transportation
(E.C. Report, Pages 186-191)

The nation's transportation system is an inter-related web essential to the health of the economy and the nation's security. Each element of the national system—subways, urban and intercity buses, airplanes, trucks, railroads, maritime—contributes to the effectiveness of the whole, fulfilling a broad national purpose. Fostering and maintaining this system depends both upon the private and public sectors since no single mode of transport or sector of society can do the job alone. Nor should it.

Transportation is not a service which can be left to private enterprise alone and unchecked market forces. Government has a vital role in funding as well as establishing and enforcing rules and standards to assure there is enough and the right kind of transport, that workers are protected, that there is wide access to transportation services, and that the public interest is protected through reasonable overall regulation and control. Considerations of national security, clean air, safety and the welfare of consumers—to name a few—are considerations which cannot be left to chance, or solely to the private sector and the marketplace.

The AFL-CIO supports the development of a national transportation policy. The development of such new national policy should involve worker representatives in the industry so that it benefits the lives and interest of all American consumers and workers and strengthens America's position in world trade.

Maritime

For more than a decade, the maritime industry suffered greatly from willful government inaction.

The AFL-CIO believes that the time has come to revitalize all segments of the maritime industry. Positive action must be undertaken to insure that the nation's economic and security interests are not jeopardized further through an inadequate merchant fleet and shipbuilding capability. The deficiencies in strategic sealift must be corrected and steps taken to implement a policy of industry renewal. The Congress must advance legislation which will enhance existing support programs or lead to the development of new initiatives that will permit the U.S. fleet to compete in the decade ahead. The following measures are basic for the broadest possible industry recovery:

- Federal agencies responsible for the overseas movement of government cargo must maximize the use of U.S.-flag vessels at rates that fully compensate for services rendered.

- To prevent further encroachment by foreign shipping interests the Administration representatives to the Uruguay round of GATT negotiations should reject any proposals to include maritime services in any final agreement on services.
- The U.S. should encourage development of bilateral maritime agreements that would insure adequate levels of commercial cargoes for American-flag carriers. Endorsement of the existing international cargo sharing arrangement contained within the United Nations Conference on Trade and Development Code of Conduct for Liner Conferences would provide immediate relief to American-flag operators.
- A cabinet level maritime liaison charged with responsibility for monitoring compliance by various government agencies of a Presidential sealift policy should be created. This office would coordinate inter-agency activity in furtherance of the goal of insuring maintenance of a domestic sealift capability. Vessel construction programs that will permit maintenance of a shipyard mobility base supported by an infrastructure of marine industrial operations should be enacted. Vessels constructed under any "build and charter" program should be made available for operation at rates that would promote active participation by American-flag carriers.
- The Administration should rescind regulations which have allowed foreign-flag cruise ships to undercut domestic cruise fleets. Where necessary, legislation should be developed to ensure that foreign-flag carriers that rely upon the American tourist trade for their survival are subject to the same requirements as American cruise vessels.
- We advocate funding programs for the construction and operation of American-flag vessels in the nation's foreign commerce.
- A "Buy American" program for U.S. financial aid to foreign nations that would limit abuses of the cash transfer program should be developed. It also would insure that American producers of manufactured goods and agricultural products benefit from our nation's generosity. The program would also enhance domestic flag shipping operations.
- Reactivation of the Title XI ship loan guarantee program is necessary for ship operators to secure financial backing necessary for the construction of new tonnage in domestic shipyards.
- Government recognition of the important economic and military sealift benefits derived from a U.S.-flag fleet engaged exclusively in domestic shipping operations must be underscored. To enhance maintenance of this fleet, the Administration must broaden its support for Jones Act operations beyond existing services. In this regard, we call for extension of domestic cabotage requirements to all marine operations performed within the nation's 200 mile Exclusive Economic Zone.
- The Federal Maritime Commission should be encouraged to utilize its strengthened investigatory authority to examine complaints of unfair shipping practices by foreign nations. The FMC also should be assured cooperation by the Administration that it will be permitted to take a positive action against nations that maintain barriers to U.S.-flag operations.
- For over a decade the nation has benefited directly from the energy

resources of Alaska's North Slope coastal plain. The current Alaska oil export restrictions expire in September 1990 and timely action is essential to insure these energy resources are reserved for domestic purposes.

No single solution exists that will restore the maritime industry's ability to fulfill its legislatively mandated dual role of maintaining a commercial presence worldwide while insuring the availability of strategic sealift. Timely implementation of these recommendations, however, will spur the investment necessary for a comprehensive industry revival.

Trucking

The continuing deregulation of the interstate trucking industry has led to the following adverse consequences:

1. High level of bankruptcies—over 100 large (class 1 & 2 ICC) regulated motor carriers of general freight have terminated operations since July 1, 1980—the date of enactment of the Motor Carrier Act of 1980.
2. High unemployment—at least 130,000 trucking industry workers have lost their jobs since July 1, 1980.
3. Decline in safety on the highways for truck drivers and the motoring public.
4. Large shippers continue to profit from their exercise of market power at the expense of motor carriers, employees and the traveling public—with no evidence that the lower trucking rates enjoyed by large shippers are passed onto the public in the form of lower prices to consumers.

We firmly believe that the adverse impact of trucking deregulation will accelerate unless Congress and the Administration take proper and reasonable steps to ease the adjustment process.

We support strict enforcement of all safety related laws and regulations by federal and state governments with meaningful and realistic penalties to deter violations. Staffing and funding for truck safety enforcement must be increased at both the federal and state levels. All motor carriers must receive "satisfactory" safety ratings from the U.S. Department of Transportation in order to haul goods in interstate commerce. Shippers must bear responsibility for the acts of motor carriers they utilize to transport their products.

Employees who have lost their jobs because of trucking deregulation should be able to receive adjustment assistance or labor protection provisions administered by the U.S. Department of Labor.

In addition, all employees, including owner-operators on lease to I.C.C. regulated motor carriers, must have the right to organize and bargain collectively. The so-called independent contractor exemption to the nation's labor laws must be ended.

In the past, public policy has been made without adequate and reliable information. The Congress should require that the Interstate Commerce Commission mandate that all interstate motor carriers file annual financial and operating reports. Moreover, the U.S. Department of Transportation should be required to develop and maintain comprehensive accident and safety statistics.

We urge that the Hazardous National Transportation Act be strengthened to better protect transportation workers as well as the general public. We believe too much emphasis is being placed on the role of the truck driver in the quest for truck safety and not enough attention is being focused on the safety responsibilities of the motor carriers and the shippers, particularly the large shippers.

In light of the devastating effects of the deregulation of interstate transportation, we oppose efforts to extend deregulation to the intrastate level. There should be a full-scale reexamination of federal labor policy for all transportation industry employees. Finally, truck drivers and related personnel working for airlines should not be covered under the Railway Labor Act.

Railroads

The U.S. needs a balanced transportation network which includes a fully-functioning rail system for the convenient and economical movement of goods and people. Industry deregulation and budget cuts have eliminated many jobs in the rail industry and are likely to cause more job and income losses in the future.

To avoid regulations, which already have been cut down excessively, many short lines have been spun off to small, often family-run, operators. Because these moves dismantle rail networks, render service less reliable, push down wages, and undermine fundamentally important regulations, the AFL-CIO calls for legislation to control and limit such spinoffs.

The AFL-CIO supports the President's Commission on railroad retirement. We are pleased that this question is getting the attention it deserves and we look forward to recommendations of the Commission to insure the continued existence of the railroad retirement system.

The AFL-CIO calls on Congress for: continued governmental support of AMTRAK to assure passengers continued rail service; support of AMTRAK workers and its unions in their determination to achieve pay equity with other rail workers; and examination of the counterproductive tactics of management which are detrimental to this important service.

Mass Transit

The AFL-CIO supports a strengthened National Transportation policy for the 1990's and supports federal legislation designed to increase mass transit funding for both operating and capital assistance.

We call for legislation comparable to the 1987 Mass Transportation Act including at least $6 billion annually to assist local communities and transit authorities in the purchase and upgrade of equipment and facilities. Special emphasis should be placed on "Buy American" programs which would help reverse the decade-long decline of our public transportation equipment manufacturing industry.

Any program of expanded federal aid for mass transit must be premised on the continuation of collective bargaining rights and the preservation of a free collective bargaining process on all mandatory subjects of bargain-

ing, based on the right to strike or use of arbitration to settle unresolved disputes.

Appropriate legislative and political efforts ought to insure that the policies and procedures for administration of the Section 13(c) employee protection provisions under the Federal Urban Mass Transportation Act in effect prior to the unwarranted changes either implemented or proposed by the Reagan and Bush Administrations be reaffirmed in the interest of affected employees; and that Congress reject and set aside any proposals for adverse changes in Section 13(c) policies and procedures.

The labor protection provisions of the Urban Mass Transportation Act should not be transferred to the Department of Transportation, but must remain the exclusive responsibility of the Department of Labor.

The Congress should maintain provisions guaranteeing that labor standards include the payment of prevailing wages to all workers engaged in the construction or operation of mass transportation facilities involving federal financial assistance, and that such standards also guarantee to rail and transit workers the first opportunities of employment arising from federal transit funding.

Authorized legislation should include provisions to recognize that decisions about the terms and conditions for private sector participation in transportation, including decisions to employ competitive bidding, privatization or subcontracting with private operators, if warranted, should be made at the state and/or local level free from any federally imposed standards, guidelines, policies or grant conditions; and that private sector involvement in public transportation remain a local decision to be employed only when such service is complementary to the existing public transit network and only where there can be a partnership of public and private providers protective of employee interests and the riding public.

The AFL-CIO opposes efforts to condition, delay, or prioritize transit grants to applicants based on the extent or amount of service provided by private transit operators.

Airlines

The AFL-CIO believes that Congress should investigate the repeated misuse of the bankruptcy laws, such as that occurring in the Eastern proceeding. The AFL-CIO supports legislation that would enable creditors, including unions and employees, to go after assets that were previously transferred by a debtor, such as Eastern, to a parent company and related subsidiaries.

Concerns about safety and the jobs of American workers were heightened when the Department of Transportation (DOT) issued a Final Rule, effective December 1988, that would allow U.S. airlines to contract out airline aircraft maintenance, repair and overhaul work to foreign repair stations. The DOT's Federal Aviation Administration is currently understaffed and has neither the manpower nor resources to monitor maintenance performed abroad. The AFL-CIO supports legislation to reverse the DOT's action.

The Administration has continued to forestall attempts to impose labor protective provisions (LPPs) to moderate hardships inflicted upon workers as a result of mergers. Although the House and Senate approved LPP legislation in the 100th Congress, the effort to send such legislation to the White House failed in 1988 when the LPP provisions were dropped from a Department of Transportation's Appropriations Conference Report. Now, authority to consider imposition of LPPs in airline merger cases has been transferred from the DOT to the Justice Department. The AFL-CIO continues to support imposition of LPPs in airline merger cases either by the Justice Department or, if necessary, through legislation.

Referred to the Committee on Resolutions.

American Public Transit Association March 10, 1990

The Highway Trust Fund "Surplus"

Spend out of the so called "surpluses" in the Mass Transit Account and Highway Account of the Highway Trust Fund is frequently viewed as a source of increased federal funds for surface transportation. These proposals are based on a cursory examination of the financial status of these trust funds where unexpended balances of revenues are misinterpreted as funds that can be used for obligations. Statements are made that there will be an "surplus" of $7 billion in the Mass Transit Account and a "surplus" of $18 billion in the entire Highway Trust Fund by the end of FY 1990. Unfortunately "surpluses" this large do not exist.

By the end of FY 1990 the Mass Transit Account of the Highway Trust Fund is projected to have an unexpended balance of $6.9 billion dollars. Of this amount $4.0 billion is the obligated balance of funds to pay for grants that have been approved by the Urban Mass Transportation Administration (UMTA). An additional $0.5 billion is the unobligated balance of contract authority in excess of appropriated obligation limits. This leaves a total of $2.5 billion in income that is not committed to current or future obligations.[1] This calculation is shown in the first column of Figure One. Thus the "surplus" in the Mass Transit Account is $2.5 billion, an amount that would fund the urban mass transportation program at levels proposed by the APTA Legislative Committee for reauthorization in FY 1992 for a period of only two and one-half months.

The surplus, however, only exists when the Mass Transit account and the Highway Account are treated separately. Commitments to the Highway Account of the Highway Trust Fund are so large that they overwhelm the small "surplus" in the Mass Transit Account. By the end of FY 1990 the entire Highway Trust Fund is projected to have an unexpended balance of income of $17.9 billion. The Fund will also have an obligated balance of $26.0 billion and an unobligated balance of $11.4 billion resulting in an uncommitted balance of negative $19.5 billion, i.e., the federal government has made obligations or has contract authority to make commitments to spend $19.5 billion more than there is currently in cash in the Highway Trust Fund. This calculation is shown in the third column of Figure One and described in the Glossary beginning on page 3.

---

[1] Calculated from data in Budget of the United States Government, Executive Office of the President of the United States, U.S. Government Printing Office, Washington, annual.

Figure One:
Projected Balances in Highway Trust Fund, FY 1990
(End of Year, Billions of Dollars)

	Mass Transit Account	Highway Account	Total Highway Trust Fund
Unexpended Balance	$ 6.94	$ 10.98	$ 17.92
Obligated Balance	− $ 3.97	− $ 22.02	− $ 25.99
Unobligated Balance	− $ 0.48	− $ 10.95	− $ 11.43
Uncommitted Balance	= $ 2.50	= ($ 21.99)	= ($ 19.49)

In 1989 the U.S. General Accounting Office (GAO) was asked by the U.S. Senate to determine if "the balance in the Highway Account exceeds amounts needed to meet outstanding commitments."[2] The GAO found that "the balance in the Highway Account at the end of fiscal year 1988--about $9 billion--is needed to pay commitments to states. The balance, therefore, is not a surplus. These funds, along with projected future revenues, will be used to pay about $31 billion in commitments that were outstanding as of fiscal year 1988." The GAO did not examine the Mass Transit Account but application of the same procedure, as done above, shows that the bulk of the balance in the Mass Transit Account is also committed and cannot be considered a surplus.

The Federal Highway Administration (FHWA) is permitted to have commitments equal to the existing uncommitted balance of income in the Highway Account plus two years worth of projected revenue. This provision, known as the "Byrd Amendment" was included in the original Highway Trust Fund legislation to ensure that sufficient funds would be available to liquidate commitments. As revised in 1982, the amendment would allow FHWA at the end of FY 1990 to have commitments equal to the current unexpended balance of $11 billion plus the projected income from FY 1991 and FY 1992 of approximately $29 billion for a total commitment of $40 billion. This means that the uncommitted balance which is projected to be a negative $22 billion at the end of FY 1990 on Figure One could legally be as high as a negative $29 billion, that is, $40 billion in commitments minus $11 billion in unexpended balance of income equals $29 billion in commitments in excess of existing funds.

The positive uncommitted balance in the Mass Transit Account results from interest income, it is not a result of any failure to provide budget authority for anticipated tax income. From the beginning of the program in FY 1983 through projections to the end of FY 1990, $9.018 billion income from the gasoline tax will have accrued to the Mass Transit Account. During the same period cumulative budget authority will equal $9.032 billion, a difference of less than two-tenths of one percent. The $2.5 billion uncommitted balance thus results from interest income earned from the unexpended balance of the Account.[3] This relationship is

---

[2] United States General Accounting Office, Highway Trust Fund. Condition and Outlook for the Highway Account, Washington, May 1989.

[3] An increase in unexpended balance of $194 million for FY 1986 is shown in the Budget of the United States Government, Appendix, 1988. The additional prior period income necessary for this accounting change is not identified by source. If this income were from tax revenues, cumulative tax revenues would exceed cumulative budget authority by 2.0 percent rather than the 0.2 percent shortage reported above.

illustrated in Figure Two.

The large amount of interest income accrued to the Mass Transit Account results from the low outlay rate of obligated funds in the Account. Annual outlays have equalled approximately 20 percent of sum of the obligated balance plus newly incurred obligations each year from FY 1985 through projected FY 1990. Outlays for the Highway Account, in contrast, have been nearly 40 percent of this value over the past three years. The low outlay rate of the Mass Transit Account has allowed the build up of an unexpended, even though committed, balance that accrues interest. The relative size difference of the unexpended balances results in 30 percent of Mass Transit Account income being from interest while only 7 percent of Highway Account income is from interest. If all uncommitted balances in the Mass Transit Account were committed and quickly outlayed, the percent of income from interest would drop to the level experienced by the Highway Account and the "surplus" would disappear. Thus the quick obligation and spend out of the uncommitted balance of the Mass Transit Account could be expected to be a one time event with a new "surplus" not accumulating.

Glossary of Line Items in Figure One:

This glossary describes the four line items presented in Figure One in generalized terms in order to explain basic relationships.

Unexpended Balance: The unexpended balance is the accumulation of income in an account that has not been outlayed, i.e., cash or U.S. government securities that have been received but have not been spent. Income is received either as revenue from an excise tax such as the gasoline tax or as interest on investment of the unexpended balance.

Minus the Obligated Balance: In order for revenue to be spent several actions are required. Legislation must be passed authorizing a government agency to incur an obligation. An obligation is a promise by the government to pay for some service or product. This occurs in the transit program when UMTA makes a grant to a transit system to make a capital purchase or for operating assistance. In the case of the capital grant UMTA has promised the transit agency to pay for a percentage of the capital item when it is delivered or constructed. This promise is an obligation. The obligated balance is the total value of obligations made that have not yet been outlayed, i.e., that have not yet been paid for. This is money that will be requested from the government and will then be taken from the unexpended balance.

Figure Two:
Mass Transit Account Budget Authority
Compared to Income, 1983 - 1990

Minus the Unobligated Balance: The unobligated balance is the amount that has been authorized by legislation as contract authority for a government agency to obligate but has not yet been obligated. This can result for two reasons: (1) an appropriation that sets a limit on the amount of authorized contract authority that can be obligated is made each year and that limit in some years is less than the full amount of authorized contract authority or (2) the obligated limit of contract authority has not yet actually been obligated because of delays in the obligation process, but can be expected to be obligated within a short time period.

These amounts cannot be totally differentiated from balances reported in the annual Budget of the United States Government. Based on data from the Budget and from appropriations documents, virtually the entire amount of unobligated balance in the Mass Transit Account projected at the end of FY 1990 is the difference between authorized contract authority and appropriated obligation limits on authorized contract authority.

Equals Uncommitted Balance: This is the amount of the unexpended balance that is not committed, that is, the amount of accrued income that is not required to meet existing obligations or contract authority. For the Highway Account and The Highway Trust Fund as an entity this is a negative figure, i.e., the amount the government is obligated to pay or has as contract authority will be over $19 billion greater than cash and securities in the Highway Trust Fund by the end of FY 1990.

November 29, 1989

Dear Reader:

Transportation in the United States is at a key crossroads. The federal highway and transit policies of the 1950s and 1960s essentially have fulfilled their goals. And yet, despite this record of significant accomplishment, we face severe transportation problems in many parts of the country. Worsening congestion is sapping our economies, polluting the air supply, squandering natural resources, and detracting from overall quality of life.

In the near future, an important new generation of national transportation policies will be forged. These policies will not only influence our ability to restore basic mobility in the future; they also will determine how well or how poorly transportation serves major national goals of economic prosperity and environmental quality.

This is the backdrop for the final report of the Transit 2000 Task Force. It is our conclusion that policies and programs at the federal level must be changed and service delivery at the state and regional level must be redefined if we are to preserve and enhance mobility. The report describes our recommendations in more detail. The central theme, however, is this: As a nation, we must make a commitment to reduce our dependence on the automobile and to increase the share of travel demand on convenient high-occupancy, shared-ride services of all kinds.

With the publication of this report, the Transit 2000 Task Force completes the mission we were given by the transit industry in 1987. I express my appreciation to every member of the task force for their generous commitments of time and the creativity of their ideas. The strength of the final report lies in the wide cross-section of transit leaders who participated so actively over the last two years.

The next step is up to us in the transit industry and all others who care about the intertwined issues of mobility, economy and environment. I believe that our concerns over these issues are shared by a broad spectrum of individuals and organizations. I urge you to consider the call for change and the ideas that we have expressed in the final report. The task force invites you to join us in helping to shape a new transportation agenda for America.

INTRODUCTION

Across America public transportation serves over nine billion trips annually. Today's public transit systems range in size from several thousand vehicles, both bus and rail, operating in our major metropolitan areas, to systems operating one or two vans serving rural residents.

These systems and services are an integral part of the national transportation network that keeps America moving. Without them, major portions of our street and highway system would become gridlocked, our bridges and tunnels would be impassable, and urban and rural residents alike would be isolated from essential services and job opportunities. In addition to supporting the mobility needs of millions, today's public transit services directly support basic economic activity, reduce damage to our environment, and maintain the cohesiveness of our neighborhoods and communities.

Support for public transit is provided through a long-standing partnership involving riders, federal, state, and local governments, and the private sector. Over the past two decades, transit has evolved into a mature, vitally important public service industry through the impetus of a federal transit assistance program that began in 1964.

Looking ahead to the twenty-first century, it is evident the nation is moving rapidly into an era that will bring new pressures and challenges to bear on our businesses, our governments, our communities, and our people. None of these threats more directly places the quality of life in our urban and rural communities at risk than the continuing decline of mobility.

The combined effects of explosive growth in travel demand, inattention to transportation investment needs, the harmful consequences of piecemeal land use decisions, and our insatiable appetite for automobile use are overwhelming our transportation systems and facilities. In turn, the increasing inability of those transportation systems to handle the efficient movement of people and goods steadily is eroding our regional economies, reducing our international competitiveness, and diminishing dramatically the quality of our environment.

Today, we face these challenges without a coherent, coordinated national transportation policy. Current federal transportation programs that promote separation in the planning and funding of interrelated transportation facilities increasingly are unresponsive to emerging needs and the broader consequences of transportation investment decisions. The inflexible, categorical nature of existing programs limits how we deploy available resources and decreases the cost-effectiveness and efficiency of our investments. In addition, we are bound by a traditional preoccupation with accommodating *vehicles* and inattention to accommodating *people*. Finally, existing programs have become ineffective due to the lack of adequate funds, generally, and insufficient support for public transportation, specifically.

In face of these flaws, it increasingly is apparent that our existing national transportation policies and programs are not up to the task of moving us into the twenty-first century.

In the coming months, however, a series of converging opportunities exist to restore our vision of what constitutes a productive, livable community, and to put in place national transportation policies and programs that can help make this vision a reality in the decades ahead.

Our existing national transportation policies and programs are not up to the task of moving us into the twenty-first century.

Square & Respreen → Street 4/1

Formulation of A New National Transportation Policy

Initiatives by the U.S. Department of Transportation to craft a new national transportation policy represent an opportunity to look broadly at the issues we confront, to be bold and visionary in response, and to establish a broader coalition in support of sound transportation investment. This important policy debate will allow exploration of broader perspectives than otherwise might be addressed in the traditional federal budget and legislative arenas.

Reauthorization of the Surface Transportation Assistance Act

The completion of the Interstate highway system, the expiration of the federal gasoline tax, and the expiration of federal authority to invest in highways and transit will lead to legislative initiatives to renew the federal commitment to surface transportation in 1991. The opportunity to reformulate and redirect federal programs provides a unique avenue to promote new, forward-looking ideas and concepts.

Reauthorization of the Clean Air Act

The nation's 18-year old commitment to clean air also must be renewed in the coming months. This provides a new opportunity to integrate transportation and clean air goals, policies, and programs in a comprehensive way. Transportation investments must be viewed as a tool in our pursuit of clean air.

New Budget Initiatives

Continued progress to reduce the federal budget deficit likely will require major action to raise revenues and further revise the tax code. Consideration of energy and motor fuel tax increases as part of this debate seems inevitable and provides a critical opportunity to restore transportation investment to levels necessary to support a vibrant economy, enhanced mobility, and a cleaner environment.

In recognition of these opportunities, the APTA Transit 2000 Task Force has sought to explore what we must accomplish as a nation, and to promote a better understanding of how a renewed and strengthened commitment to public transportation can help in pursuit of enhanced mobility and the achievement of other major national goals.

The report that follows highlights the conclusions and recommendations of APTA's Transit 2000 Task Force. The recommendations center on the need to:

1. More closely integrate transportation and other national goals and policies;
2. Provide viable options to dependence on the automobile;
3. Retool and redirect federal transportation programs; and,
4. Increase investment in the nation's transportation systems and services.

THE TRANSIT 2000 TASK FORCE

The APTA Transit 2000 Task Force was convened in 1987 and is made up of nearly 50 members, including general managers and transit board members representing both the largest transit systems in the world as well as some of the smallest. Also included are top corporate executives from private businesses that supply and advise transportation professionals, worldwide.

The mission of the task force has been to outline the steps necessary for the nation's public transit industry to achieve its greatest potential in the years ahead. In pursuing this mission, the task force has explored the full range of issues that affect public policy in transportation, travel demand and industry operations. The activities of Transit 2000 have been carried out through a number of working groups. These have focused on the changing external environment in which transit and transportation decisions must be made, the long-range mission of the industry, finance and intergovernmental partnerships and other factors that must shape future decisions on how our national transportation network is to be rebuilt and expanded. The efforts of the various working groups have been incorporated into a number of supporting documents listed in the appendix.

The conclusions of the task force lay the groundwork for evolution of the nation's transit industry and reauthorization of federal transit and highway programs. In offering these findings, it is the intention of the Transit 2000 Task Force to outline bold, aggressive, and innovative policies that will allow our nation's public transportation systems and services to meet fully the challenges and opportunities that lie ahead.

1. THE FORCES OF CHANGE

Transit 2000 has explored in detail the numerous forces, factors, and trends that will influence the setting in which public transportation will operate in the coming decades. To a considerable degree, these forces call into question how we make our transportation investment decisions, how we manage future economic growth, and how we ensure the quality of life in our communities and the nation.[1]

Congestion and Automobile Dominance

Congestion is a common feature of urban and suburban travel. Delays on the existing street and highway network already have reached crisis proportions in major travel corridors and during the busiest times of the day. New highway facilities, even in the suburbs, are jammed immediately. The inability to keep the current transportation network in an adequate state of repair contributes to mounting congestion. The consequence is economic loss and increasing safety problems for urban and rural residents alike.

The most conservative estimates indicate that total travel is expected to increase approximately 2% per year. This would add to the current roadway system over the next 32 years the same amount traffic that has been added in the last 32 years. In faster growing communities, total travel will grow three times this amount annually.

As a consequence, over the next 20 years, congestion will increase more than 400% on the nation's freeway systems and over 200% on non-freeways, according to the Federal Highway Administration. In areas under one million population, freeway congestion will increase over 1000%.

An estimate of the staggering cost of congestion on our urban freeways alone, published in a recent Transportation Research Board report, concluded that in the next 20 years annual delay in travel time will increase by 5.6 billion hours, excess fuel consumption will increase by 7.3 billion gallons per year, and total costs to travelers will increase by $41 billion per year.

Congestion is a direct function of continuing reliance on private vehicles. Today, average work-trip automobile occupancy is 1.15 persons per vehicle, nationwide. Household automobile ownership is expected to increase past the point where, on average, an automobile will be available for every employed person.

As consumers, we currently spend more than $336 billion a year on user-operated transportation. This represents more than the amount we spend on groceries and nearly the same amount we spend on medical care. Expenditures for automotive advertising alone totaled nearly $5 billion in 1986, an amount that exceeds the total of *all* capital investment in public transit facilities and equipment.

Despite the questionable nature of current vehicle use patterns and transportation priorities, the private automobile will remain America's central means of mobility in the coming years. There is considerable doubt, however, whether continued dependence on single-occupancy, private vehicles can or should be accommodated indefinitely.

Estimates by state highway officials indicate a need for 102,000 new lane miles of highway on new alignments. Expectations are that it will not be possible to construct all or even most of these facilities. If 20% cannot be built, the demand for public transportation will double.

Automobile availability and use will continue to increase, but the convenience of single-occupancy, personal vehicle travel is likely to deteriorate significantly in more and more areas of the country, heightening the need for new options and strategies to enhance mobility.

The convenience of single-occupancy, personal vehicle travel is likely to deteriorate significantly in more and more areas of the country, heightening the need for new options and strategies to enhance mobility.

[1] A variety of detailed background papers were prepared highlighting major trends and factors that will affect the provision of transportation services in the future. These background papers are listed in the appendix to this report.

Square & Recreen H/T

The Suburban Problem

The rapid pace of suburban growth and development continues to represent one of the most perplexing transportation problems in the years ahead. The suburban phenomenon has been characterized by low densities, a patchwork of buildings and land uses, the separation of jobs from willing workers, and the absence of effective coordination between real estate development, transportation, and other infrastructure investments.

Rapid suburbanization has resulted in highly scattered trip-making with near total dependence on single-occupancy vehicles to accommodate suburban travel needs. The explosive growth in suburban travel now overwhelms street and roadway capacity and, in many instances, cannot be accommodated economically by traditional transit services.

Although the high rate of suburban growth is expected to continue into the next century, the suburban transportation problem is becoming more complex and multifaceted. The traditional form of suburban development now is being altered by mounting concerns over congestion and declining mobility. There is increased unwillingness to accept the environmental and other consequences of unrestrained development and traffic. These concerns have led to two contrary reactions around the country.

On one hand, there is heightened competition and often predatory behavior by communities in pursuit of economic development. On the other hand, concern over deteriorating quality of life has led to anti-growth measures that threaten to slow economic development. As an example, there were 47 "slow-growth" initiatives on California ballots in 1986; two-thirds of these initiatives passed. Both responses indicate that current development policies, land use controls, and public investment strategies are failing and that wiser ways must be sought to promote and accommodate economic growth.

Some change is beginning to occur. The elimination of tax incentives has dampened the helter-skelter boom in suburban office growth. In addition, states, regions, and localities are adopting often controversial plans and strategies that aggressively guide development in a manner designed to avoid the transportation and related problems that now are occurring.

As a result, the pace and form of suburban development is beginning to change. New, major multi-use centers and "urban villages" are emerging as an overlay on the traditional, low-density, suburban landscape. In many instances, these "urban villages" now approach the densities of typical downtowns. These development patterns require a much broader range of transportation solutions to attract "choice" riders and serve the particular needs of suburban travelers, emerging corridors and activity centers, and specific trip purposes.

Transit services that served older central areas have growing application in many suburban settings, including radial route networks, internal circulators, shared-ride services, park-and-ride facilities, preferential treatment of high-occupancy vehicles, and others. Clearly, a broader range of high-occupancy, shared-ride services will be critical in our suburban areas in the years ahead.

A broader range of high-occupancy, shared-ride services will be critical in our suburban areas in the years ahead.

Central Cities

Despite the concentration of travel demand growth in the suburbs, central cities and central business districts (CBDs) continue to be the dominant single focal point for urban travel, and they remain the economic engine and employment bellwether of the nation. Trips to and from CBDs continue to increase, requiring maximum effectiveness from the transit and highway systems already in place.

Strong service industry growth in central cities along with growing labor force shortages indicate an increased focus will be placed on employment locations that are accessible from throughout a metropolitan region. These and other factors suggest there will be continued strong growth in central cities and CBDs where services, infrastructure, amenities, and a large labor pool already exist.

Travel demands in central cities require that maximum use be made of traditional forms of public transit, including rail services, bus services, busways and transitways, and a variety of high-occupancy, express services. Where natural markets already exist for these services, or where natural markets are certain to emerge, transportation policy must encourage maximum use of traditional transit services. Failure to do so will diminish further the effectiveness and efficiency of the entire transportation network.

Where natural markets already exist or where they are certain to emerge, transportation policy must encourage maximum use of traditional transit services.

Air Pollution and Environmental Quality

Worsening air quality represents a growing crisis for the nation. The facts that relate air pollution to motor vehicle use and particularly, reliance on single-occupancy vehicles, are undeniable.

Sixty-eight cities are too polluted to meet federal standards for ozone; 59 cities fail to meet standards for carbon monoxide pollution; over 100 suburban areas exceed current pollution standards.

Success in reducing air pollution will require strategies to encourage travel behavior that better supports achievement of air quality goals and standards.

Mobile sources cause over 30% of carbon dioxide emissions, the pollutant that promotes global warming via the "greenhouse" effect. In addition, motor vehicles contribute 40% to 60% of the hydrocarbons that produce our urban ozone and smog problem, and cause 70% to 80% of our carbon monoxide emissions.

Persistent or worsening air pollution now is known to affect everyone, not just those with respiratory problems. Nearly 150 million Americans now live in areas where air quality is below acceptable standards. The American Lung Association estimates the national health care bill for air pollution illnesses is $40 billion per year.

The effects of worsening air quality extend beyond human health. Ozone accumulation at ground level threatens the long-term economic viability of entire industries. Crop losses due to ozone, smog and other air pollutants in the United States each year equals $1.3 billion.

Reduced vehicle emissions are essential in the effort to improve air quality. Emission reductions from new tailpipe standards and technology, however, will be offset by increased emissions from growth in total travel demand beginning in the mid-1990s. Success in reducing air pollution, therefore, will require strategies to encourage travel behavior that better supports achievement of air quality goals and standards.

Source of Research #17

Threats to Energy Independence

As a nation, we now risk becoming more dependent on foreign sources of petroleum than at any time since the early 1970s. Major factors responsible for this growing dependency include our increased appetite for petroleum stemming from growth in travel demand and our continued reliance on low-occupancy, private vehicles. In 1986, autos and small vehicles consumed over 100 billion gallons of gasoline—more than 400 gallons a year for each man, woman, and child in the nation.

Transportation accounts for 65% of petroleum use today and petroleum imports have risen to 35% of total supply. Over 50% of imported petroleum comes from OPEC countries. Imports may increase to 60% of the nation's annual gasoline requirements by the year 2000. The U.S. Department of Energy considers the current situation, and the likely future situation, a threat to national security.

Despite today's abundant supply and low prices, some forecasters project as much as an eight-fold increase in petroleum prices after the year 2000. Today, however, gasoline prices in North America, and in the United States particularly, remain well below world levels, and act as an incentive for consumption rather than conservation. The 1987 average price per gallon of gasoline in the United States was 82¢ including an average 25¢ in total taxes. In five western industrial nations—America's economic competitors—the 1987 average price was $2.78 per gallon, including $1.84 in taxes.

Our energy future remains clouded by today's ready supply of petroleum fuels and relatively low prices. But we are short-sighted and unprepared for change. A coherent long-term energy policy must be put in place aimed at wiser ways to accommodate future travel demands.

Inadequate Infrastructure Investment

The proportion of public spending on basic infrastructure has dropped precipitously. During the 1960s, public works capital investment totaled $14-$15 billion for every $100 billion of private investment. Today, the figure is $7 billion for every $100 billion of private investment.

Since the mid-1960s, federal investment in transportation, as a percent of GNP, has been cut in half. Adjusted for inflation, federal spending on public transit has declined nearly 50%, just since 1980.

Americans now are witnessing and experiencing the consequences of this declining investment in the form of deterioration and collapse of facilities, a growing backlog of investment needs, mounting safety problems, and declines in productivity. Failure to meet the ever-increasing costs of restoring basic transportation facilities and providing new capacity will lead to greatly increased costs in future years.

The trend of declining infrastructure investment, particularly in transportation and public transit, remains a mounting threat to our economy and quality of life. Greater investment is essential.

This pattern of declining investment and the implied willingness to consume, without replacing, the transportation system that supports our economy and that of future generations stands as one of the strongest testimonials to the short-sightedness of recent public policy.

Dozens of analyses have been conducted in recent years on the scope of the infrastructure crisis. Each sounds the same theme: that increased infrastructure investment is essential and high quality public services and facilities are an absolute necessity for economic growth and increased productivity.

In February 1988, The National Council on Public Works Improvement recommended overall infrastructure investment be doubled within the next 10 years.

Analysis from the Federal Reserve Bank of Chicago indicates the tumbling rate of infrastructure investment coincides directly with declines in both the level of private capital investment and the rate of return on private capital investment. The analysis is unequivocal in pointing out the powerful effect of public infrastructure investment on the strength of our overall economy.

Most recently the National Governor's Association issued a report of its Task Force on Transportation Infrastructure. In referring to the state of the nation's transportation systems, the report suggests, "the vitality of both transportation and commerce is now threatened by a pattern of underinvestment and neglect."[2]

[2] "America in Transition: the International Frontier," Report of the Task Force on Transportation Infrastructure, National Governor's Association, 1989.

Square & Rectrcen H PT

Chronic underinvestment in infrastructure is compounded by various provisions of the federal tax code. Many of the tax reform measures enacted in 1986 discourage rather than encourage investment in public facilities by making it more difficult and more costly for state and local governments to borrow to support these vital investments.

The trend of declining infrastructure investment, particularly in transportation and public transit, remains a mounting threat to our economy and quality of life. Greater investment is essential.

Demographic Change

A number of socio-economic and demographic trends will have a major effect on the need for enhanced mobility in the coming decades.

The number of persons over age 65 will grow from 25.7 million in 1980 to more than 65 million in 2030; the growth rate of the very elderly population over 75 will be even more pronounced. The number of women in the work force will increase from 45.5 million in 1980 to more than 65 million in the year 2000.

Minorities, predominantly blacks and hispanics, will account for nearly 60% of the population growth through the year 2000; 25% to 30% are projected to have incomes below the poverty level. By the year 2000, the black labor force will expand 31% and the hispanic labor force will expand by more than 80%.

The elderly, those with disabilities, women, minorities, and the economically disadvantaged will remain highly dependent on public transportation.

While automobile availability and use by these groups will rise, the elderly, those with disabilities, women, minorities, and the economically disadvantaged will remain highly dependent on public transportation. By virtue of their sheer numbers, greater attention must be paid to the particular travel preferences and patterns of these groups, and the availability of options to the use of private vehicles must be increased substantially.

Summary and Implications

These forces and trends have powerful implications for future travel behavior, for the formulation of a new generation of national transportation policies and programs, and for the role of public transportation in the decades ahead.

In response to these forces and challenges, a fundamental strategic choice lies ahead. One option is to limit our actions to cope only with the consequences of various trends as they occur.

We may choose, as we have in the past, to meet mobility needs that arise from myriad independent development decisions *after* development has occurred. Similarly, with respect to worsening air quality, our strategy may be focused on remedial actions to relieve the most severe problems *after* the nation's air has been fouled and our collective health and economy put in further jeopardy.

It is the view of the Transit 2000 Task Force, however, that by simply allowing these current trends to play themselves out with only a limited, remedial response is short-sighted and surely will damage our long-term economic, environmental, and social interests. In taking this view, Transit 2000 proposes a new strategic path to the future, a path that requires aggressive use of public policy, including transportation policy and investment, as a tool to restrain and reverse forces that threaten our well-being.

Our problems and challenges are national in scope; they demand a broad-based national strategy and action plan. As part of this strategy, transportation investment must become a national priority and a clear, long-term commitment must be made to expand our transportation options. Greater use of all forms of transit and high-occupancy, shared-ride services must be a fundamental element of this strategy and a goal for the nation.

38-253 O—91——41

2. MOBILITY: THE MISSION OF PUBLIC TRANSPORTATION

The trends and forces that will shape our future require not only reformulation of national transportation goals, policies, and programs but also reexamination of the transit industry's long-range mission, goals, and strategies.

Our domestic goals as a nation are clear. We desire a strong, growing, and competitive economy with opportunity for all to share in the benefits of economic prosperity. We desire an improved quality of life and a clean environment. And, we desire greater personal mobility in the pursuit of enhanced opportunities. Finally, we wish these goals to be accomplished not only today, but on behalf of future generations.

The fundamental mission of the transit industry parallels exactly our national goals.[3] The transit industry is dedicated to the goal of enhancing mobility and personal freedom of movement. The commitment to mobility, however, must be pursued in new ways, including diversification in the types of services offered and greater attention to the diverse actions necessary to better manage mobility.

A Strategy of Diversification

In considering how to provide enhanced mobility, the industry faces a choice of whether to consolidate the scope of its activities or to diversify and expand the nature of public transportation in response to the changing needs of existing and potential customers.

In considering this choice and its implications, it is clear that the future of our communities and the nation will *not* be well served by a strategy that narrows and withdraws. Enhanced mobility for transit riders and others, increased economic vitality, and improved environmental quality can be achieved only if the role of public transportation expands and diversifies, matching more intelligent service design to changing customer markets and wiser patterns of growth and development.

The pursuit of a diversification strategy represents a logical evolution for the industry. In communities where a broader range of services now are being provided by transit agencies, and the role of transit agencies has been expanded, the quality and use of public transportation has risen. As a consequence, transit system performance, and the support of the community, business leaders, and elected officials has been strengthened greatly.

A diversification strategy will have widely differing meaning, however, for systems large and small. Nonetheless, two basic perspectives have emerged that constitute a new direction for the industry, and for formulation of national transportation policy in the future. First is the need to broaden the definition of transit. Second is the need to expand efforts to better manage mobility.

Broadening Transit's Definition

Emerging markets and external forces beyond the control of transit managers require an expanded mix of transportation choices. All forms of high-occupancy and shared-ride services must be incorporated in the broader definition of public transportation, including rail, bus, car- and vanpools, preferential treatment for high-occupancy vehicles, employer-sponsored programs, and other forms of ride-sharing.

In embracing this broader definition, the transit industry must commit itself to:

- Increased efforts to maintain, upgrade, and adapt existing systems and services to better meet the needs of current riders and markets;
- Development of new high-capacity systems and services in the highest density corridors of our major metropolitan areas; and,
- Increased experimentation, introduction, and integration of innovative, cost-effective, service options in urban, suburban, and rural areas where mobility needs cannot be met fully by traditional transit services.

To reinforce this commitment within the transit industry, national policies and programs must encourage and directly support both maximum use of traditional transit services in markets where they are most effective and a broader mix of transit investments in markets where traditional services may not be fully effective.

In addition, the charter of the federal Urban Mass Transportation Administration (UMTA) should be expanded to reflect both the breadth of this mission and the expanded definition of transit.

[3] A more indepth discussion of the mission of public transit is contained in a background paper listed in the appendix of this report.

The New Role: Managing Mobility

Operating a wider range of public transportation services represents only one response in providing greater mobility and pursuing broader community and national goals. A second, equally important response includes actions that go *beyond* the operation of on-street services and directly enhance our ability to manage mobility on a more comprehensive basis.

Today, no single agency has responsibility for managing mobility. Within this vacuum, the transit industry must become a catalyst in creating an environment—both physical and institutional—that will promote a wider range of choices in travel and greater use of traditional transit and other high-occupancy, shared-ride services.

The transit industry's broadened role in the overall management of mobility includes assuming greater responsibility for a wide range of activities. Transit agencies must act increasingly to:

- Convene, coordinate, contract, broker, and promote services and approaches beyond those traditionally operated by public agencies as a means to restore and maintain a balanced and efficient transportation system. Ridesharing, high-occupancy programs, transportation management organizations, guidance and counsel to business and development interests must all be viewed as central to the expanding role of the transit agency of the future;
- Educate citizens, community leaders, and local officials on the range and nature of service options, the need for new roles and leadership by public transit agencies, and the unacceptable consequences of uncoordinated policy planning, and development; and,
- Promote and ensure stronger integration of land use, air quality, and transportation decisions so our urban areas develop in a form that can be served more effectively by public transportation services.

Elevating these new roles and establishing a new, comprehensive approach in managing mobility in the regional setting is a major focus for public transit agencies and national policy in the future.

All forms of high-occupancy and shared-ride services must be incorporated into the broader definition of public transportation.

WHAT PUBLIC TRANSIT CAN DELIVER

Congestion Relief

Every bus full of passengers at rush hour removes 40 cars from traffic; every full rail car removes 75-125 cars from traffic; every van full of passengers removes 13 from traffic.

Reduced Highway Cost

One high-occupancy vehicle lane carries the same amount of people as three regular highway lanes.

Major highways can cost $100-120 million per mile; busways can be built for $4-12 million per mile; light rail for $10-20 million per mile and heavy rail for costs comparable or lower than major highways.

Energy Conservation

A savings of ten to 15 gallons of gasoline is realized every time 40 single-passenger-car drivers take a 10-mile trip to work on the bus.

30-40 million gallons of gasoline would be saved each day if average commuter vehicle-occupancies were increased from 1.1 passengers per vehicle to 2.1 passengers per vehicle.

Air Quality

When one commuter leaves the car behind and uses transit to travel to and from work for one year, the health of millions of Americans can be improved through the removal of nine pounds of hydrocarbons, 63 pounds of carbon monoxide, five pounds of nitrogen oxides and one pound of particulates, annually.

Safety

The highway death toll—46,644 in 1988—can be reduced, along with 1.8 million annual auto-related injuries.

Economic Growth

Every $10 million in transit capital investment supports 770 jobs; every $10 million in transit operating investment supports 960 jobs.

Every $10 million in transit capital investment produces $33 million in business revenues.

Every $10 million in transit operating investment produces $30 million in business revenues.

3. TEN PRINCIPLES TO GUIDE NATIONAL TRANSPORTATION POLICY AND PROGRAMS

As an initial step in reformulating national transportation policy and recrafting federal transportation programs, consensus must be reached on basic principles. The following 10 principles are offered as a guide to reformulate the nation's surface transportation programs.

1. THE FEDERAL SURFACE TRANSPORTATION PROGRAM SHOULD BE RESTRUCTURED SUBSTANTIALLY IN ORDER TO ADDRESS MORE INTELLIGENTLY THE MOBILITY NEEDS OF THE NATION AND ENSURE PROGRESS IN MEETING OTHER NATIONAL GOALS.

Rationale: Current highway and transit programs are not adequately responsive or flexible to address current and emerging needs and problems. Substantial restructuring makes sense only if done in combination with the addition of significantly increased federal resources.

2. THE CONCEPT OF TRANSIT SHOULD BE BROADENED TO ENCOMPASS AND PROMOTE INCREASED AVAILABILITY, USE AND COORDINATION OF TRANSIT AND OTHER HIGH-OCCUPANCY, SHARED-RIDE SERVICES IN ORDER TO BETTER SERVE DIVERSE TRAVEL NEEDS, AND TO REDUCE GROWTH IN VEHICLE-MILES OF TRAVEL WHILE ACCOMMODATING INCREASED PASSENGER-MILES OF TRAVEL.

Rationale: Federal goals must be stated clearly. Doing so invites closer linkage between mobility goals and broader national goals, broadens the transit constituency, promotes investment in new mobility strategies and a broader range of services, and encourages relaxation of existing program restrictions. Each step, in turn, increases the attention paid to serving people rather than vehicles.

3. EXISTING REGIONAL DECISION-MAKING AUTHORITY OVER THE USE OF FEDERAL TRANSPORTATION FUNDS SHOULD BE ENHANCED AND STRENGTHENED.

Rationale: The local ability to assess needs, set priorities and deploy resources in a regional context must be strengthened to better serve transportation and other major national and regional goals.

4. GREATER FLEXIBILITY SHOULD BE ALLOWED IN THE USE OF FEDERAL FUNDS AND A STRONGER MULTI-MODAL APPROACH TO PLANNING, FUNDING AND DECISION-MAKING MUST BE ESTABLISHED.

Rationale: Better integration of transportation decisions, planning, and funding is necessary to make appropriate trade-offs between multiple goals and objectives on the local and regional levels, to make more cost-effective use of resources, and to reduce federal micromanagement of resource decisions and administrative actions that restricts the ability to respond to emerging needs and problems.

5. THE RELIABILITY AND PREDICTABILITY OF FEDERAL FUNDING MUST BE IMPROVED THROUGH INCREASED RELIANCE ON FORMULA ALLOCATION, INCREASED RELIANCE ON DEDICATED SOURCES OF FUNDING AT THE FEDERAL LEVEL, AND EXPANDED USE OF MULTI-YEAR FEDERAL FUNDING COMMITMENTS.

Rationale: Recipients of federal funds must be able to project and depend on stable sources of support to design and carry out multi-year projects and programs. Annual uncertainty and delays in establishing the level of federal support for transit and highways must be eliminated.

6. THE COSTS ASSOCIATED WITH MANDATED FEDERAL ACTIONS AND THE SUBSTANTIAL CONTRIBUTION OF PUBLIC TRANSPORTATION TO THE ACHIEVEMENT OF OTHER MAJOR NATIONAL GOALS PROVIDES JUSTIFICATION FOR CONTINUING FEDERAL SUPPORT FROM ALL SOURCES.

Rationale: The costs of actions required by federal law or policy are substantial and increasing. All sources of support for transit investment should be brought to bear in the years ahead. The linkage of mobility goals to other federal goals is made stronger by the commitment of both dedicated and general funds to support mandated actions.

7. SUBSTANTIAL ADDITIONAL FEDERAL FUNDING SHOULD BE PROVIDED FOR PUBLIC TRANSPORTATION TO FULLY CARRY OUT THE GOAL OF SIGNIFICANTLY INCREASING THE PROVISION AND USE OF HIGH-OCCUPANCY, SHARED-RIDE SERVICES.

Rationale: Federal transit funding has been reduced 50% in the last eight years in real terms. All indications are that historic disinvestment in transportation, the current condition of facilities, and future travel demands require *at least* a doubling of the total transit investment. The increase should be borne by all funding partners, led by the federal government.

8. AN IMMEDIATE GASOLINE TAX/MOTOR FUELS TAX INCREASE SHOULD BE ENACTED CONCURRENT WITH REAUTHORIZATION OF THE SURFACE TRANSPORTATION ASSISTANCE ACT, AND FEDERAL MOTOR FUEL TAXES SHOULD BE MADE PERMANENT TO SUPPORT NEEDED TRANSIT AND HIGHWAY INVESTMENT; FULL REVENUES FROM THE TAX SHOULD BE COMMITTED ANNUALLY.

Rationale: Needs are immediate. The traditional source of transportation funding should continue to be the basic resource for increased investment. Aggressive claims will be made by other interests on gasoline tax increases, and action on federal revenue increases, including the gasoline tax, likely will take place sooner rather than later.

9. THE FEDERAL TAX CODE SHOULD BE REVISED TO PROMOTE PRIVATE AND NON-FEDERAL INVESTMENT IN TRANSIT, AND TO ELIMINATE THE TAXATION OF EMPLOYER TRANSIT SUBSIDIES AND OTHER DISINCENTIVES TO TRANSIT USE.

Rationale: Other federal policies should strongly support direct investment in and use of public transportation rather than frustrate achievement of the goals that federal transit funding is intended to meet.

10. FEDERAL TRANSPORTATION POLICIES AND PROGRAMS SHOULD REQUIRE CLOSER INTEGRATION OF TRANSPORTATION INVESTMENTS AND LAND USE DECISIONS IN ORDER TO PROVIDE AN ENVIRONMENT THAT IS CONDUCIVE TO AND ENCOURAGES INCREASED PROVISION AND USE OF HIGH-OCCUPANCY, SHARED-RIDE SERVICES; OTHER FEDERAL POLICIES AFFECTING TRANSPORTATION DEMAND AND INVESTMENT SHOULD INCORPORATE THIS SAME OBJECTIVE.

Rationale: Unless development practices and policies at the local level are consistent with and supportive of basic federal transportation goals, the effectiveness of direct federal investment will be diminished greatly, along with the opportunity to advance other national goals. Federal attention to how land uses and development are arrayed across the landscape is necessary to reinforce these linkages.

4. NEW FEDERAL TRANSPORTATION PROGRAM FOR THE 21ST CENTURY

Rebuilding and expanding the nation's highway and transit systems to ensure they are responsive to the enormous demands that lie ahead require that national transportation policy be reshaped and federal surface transportation programs restructured substantially.

The preceding chapters have highlighted the need for major change, the goals that must be embraced and the principles that should be followed in fashioning a new surface transportation program. The concepts highlighted below provide the outline of a new federal program designed to be responsive to the needs of the twenty-first century.

THE METROPOLITAN TRANSPORTATION PROGRAM

In response to widely varying metropolitan needs and circumstances, federal transportation resources should be provided directly to metropolitan areas under a new and simplified Metropolitan Transportation Program at the federal level.

A metropolitan focus has become essential. At the metropolitan level, the complex and interrelated issues of central city and urban-suburban travel can be attacked comprehensively. At a metropolitan level the full spectrum of regional social, economic, and environmental relationships can best be addressed. At a metropolitan level we have the greatest breadth of data and information to help design our strategies and measure our success.

Figure 1 provides a graphic depiction of the four major components of a Metropolitan Transportation Program that would address both highway and transit needs. These components include:

1. A formula program to support continuing reinvestment in existing public transit systems and services;
2. A formula program to support continuing reinvestment in our existing highway system;
3. A federal source of formula funds for major expansion of *either* transit or highway capacity, giving local officials the flexibility to decide what mix of projects and investments best suit the local need to expand capacity; and,
4. A federal discretionary program targeting federal investment to major capital projects, either transit or highways.

Figure 1
METROPOLITAN TRANSPORTATION PROGRAM

A new federal Metropolitan Transportation Program should include four major program elements: a multi-modal formula program to support transit and highway capacity expansion; separate formula programs to support transit and highway reinvestment; and, a discretionary program to meet extraordinary needs and address issues of national priority.

The Metropolitan Transportation Program features several key distinctions in how federal funds are provided. First is the distinction between basic reinvestment and major capacity expansion. Second is the distinction between shared or pooled funds and the continuation of categorical funding for both transit and highways. Third is the increased flexibility available in the use of federal funds.

Each of these distinctions and the specific characteristics of the four components of the Metropolitan Transportation Program are described in more detail on the following pages and in the accompanying graphics.

REINVESTMENT

One of the most profound problems facing our nation's transportation system is the degree of deterioration that has been allowed to take place. Very simply, we are failing to fund the maintenance our current systems and facilities at adequate levels.

This fact is evident to anyone who travels anywhere across the country, and it certainly is not a problem unique to our metropolitan areas. The cost of deferred maintenance is enormous: our personal safety is jeopardized increasingly; the efficiency with which we move people and goods is diminished and the time lost increases the cost of doing business, effecting the competitive posture of our entire economy. We pay larger amounts to maintain vehicles properly, and the ultimate cost of repairing or replacing our transportation facilities increases substantially as maintenance is deferred.

No element of our surface transportation system is immune. The backlog of investment requirements for maintenance and upkeep is both staggering and mounting. Because of the scope of the problem, the fact that it can be measured easily, and its high visibility and far-reaching consequences, a new federal transportation program must provide resources *specifically targeted* for critical maintenance and reinvestment.

In providing funds targeted for reinvestment, it is appropriate to continue to allocate funds directly by mode. The various types of transit and highway reinvestment can be measured precisely, there are relatively few reinvestment expenditures that should not be made, and there is little rationale for trading off one type of reinvestment against another under current circumstances.

Reinvestment in and maintenance of our existing transit and highway facilities and services should be a national priority supported by the direct flow of federal funds.

Reinvestment in and maintenance of our existing transit and highway facilities and services should be a national priority supported by the direct flow of federal funds.

To provide greater emphasis on reinvestment, the Metropolitan Transportation Program provides a separate flow of federal funds for metropolitan transit reinvestment and a separate flow of federal funds for metropolitan highway reinvestment.

1. The Transit Reinvestment Program

The proposed Transit Reinvestment element of the program would support federal capital investment in existing transit facilities and services as well as continue federal support for transit operations.

Figure 2
TRANSIT REINVESTMENT
Metropolitan Transportation Program

A new federal Metropolitan Transportation Program should include a formula program to fund basic transit reinvestment requirements directly. The Transit Reinvestment element of the program would support both capital and operating needs for existing systems and services.

Definition of Reinvestment

For public transportation, "reinvestment" would be defined as all capital investment required to replace, rehabilitate, or upgrade existing plant and equipment, along with the capital investment necessary to retain the existing transit market share of trips.

Providing the capital funding to maintain transit's current market share from the Transit Reinvestment program would allow modest increases in services on a scale commensurate with local or regional population growth. These additions to capital plant and service levels are differentiated from "major capacity expansion" that would be funded from a shared, multi-modal source of federal funds.

It is anticipated that the majority of transit systems across the country would have their capital needs fully met at the federal level from the funds made available through the Transit Reinvestment element of the program.

Operating Assistance

The Transit Reinvestment element includes the continuation of federal support for transit operations. There are a variety of strategies that might be considered to redefine the eligible elements of operating cost, provide incentives to reduce operating costs and/or limit the federal exposure or responsibility for operating costs. These options should be explored fully in reauthorizating the federal program.

Recipient

The recipient of federal Transit Reinvestment funds would be the current "Designated Recipient" of UMTA assistance. For the purpose of reinvesting in existing transit facilities and services, the current designated recipients—most often the local or regional transit agencies—are best qualified to formulate plans, and construct and carry out necessary capital improvement programs.

In addition, in the formulation of a new federal surface transportation program, it is important to minimize the disruption to long-standing intergovernmental relationships. At the present time there is no compelling need to totally redesign the intergovernmental decision-making process with respect to basic reinvestment in existing systems and facilities. The current designated recipient mechanism allows for both continuing consultation among local and state officials and for potential change in the designated recipient should state and local officials consider it desirable.

Allocation of Funds

Federal funds available for Transit Reinvestment would be allocated by formula, using the existing UMTA Section 9 formulas that reflect urbanized area population, population density, and transit system service factors.

The existing formula provides an effective basic allocation mechanism. In the absence of any compelling reason to alter this long-standing formula, it is important again to minimize change and disruption to current practices wherever possible and to build upon the strengths of current processes.

Flexibility

Funds available for transit operations would be limited. However, consideration should be given to removing the distinction between operating and capital expenditures for systems serving small- and medium-size communities.

These communities require the most flexibility in the use of all available funds. The value of transit "block grants" for small areas has been demonstrated fully in the existing UMTA Section 18 program which provides transit funds to communities of under 50,000 population for either capital or operating expenditures.

An additional degree of flexibility is proposed for the Transit Reinvestment element by allowing some limited amount of transit reinvestment funds to be used for either highway reinvestment or for major capacity expansion projects. Such a feature would promote more collaboration and integrated design in the improvement of existing facilities and services.

Projects that currently are not the clear responsibility of any particular agency, and that have great potential for improving mobility might be carried out more easily if there is an ability to transfer or combine funds in some limited way. Examples include various forms of preferential treatment for transit and other high-occupancy vehicles, park-and-ride lots, and services provided under contract with the private sector.

The degree of transferability might be limited to a set proportion of the funds received through the Transit Reinvestment element of the program.

2. The Highway Reinvestment Program

The proposed Highway Reinvestment element of the program is designed along the same lines as the Transit Reinvestment element. Federal funds would be available to support the full scope of reinvestment activities necessary to adequately maintain and operate a designated metropolitan highway system.

Definition of Reinvestment

For highways, "reinvestment" would be defined as all capital projects on a designated metropolitan system *short* of adding additional lanes to existing facilities or on new rights-of-way. The addition of new lane-miles of street or highway would be considered a "major capacity expansion" project to be funded through that element of the metropolitan program.

Figure 3
HIGHWAY REINVESTMENT
Metropolitan Transportation Program

A new federal Metropolitan Transportation Program should include a formula program to fund basic highway reinvestment requirements directly. The Highway Reinvestment element would consolidate current categorical highway programs and provide maximum flexibility in the use of federal funds on the existing street and highway network.

Funding Operational Improvements

In addition to funding standard capital projects, the Highway Reinvestment funds would be eligible for use on projects that increase the operating efficiency of the existing facility, and for maintenance of bridges on the designated system.

Expanding the use of federal funds for these purposes represents a major departure from past practice. However, the urgency of the nation's bridge maintenance problem and the inter-modal nature of bridge needs demands broad-based attention and the use of all available resources. Also, systematic efforts must be made to increase the operating efficiency of all components of the metropolitan highway system. This equally urgent need calls for a broadening of the traditional definition of highway capital investment.

The expansion of eligibility in these two areas also provides an important parallel between transit investments, where the federal government, since 1975 has provided support for operations, and highway investments where support for operational improvements has been extremely limited in the past.

Recipient

The recipient of metropolitan Highway Reinvestment funds would be the state, with a requirement that the funds be directly passed through to metropolitan areas of over 50,000 population for programming. The programming agency, in turn, would be the regional agency designated to develop and approve transportation and related capital improvement programs required by federal law.

Again, the intention is to vary as little as possible from current intergovernmental practice in the design of the Metropolitan program.

Allocation of Funds

Federal funds for Highway Reinvestment would be allocated by formula to the states, using the existing Federal Aid Urban System (FAUS) formula. The existing formula provides an effective basic allocation mechanism and there is no compelling rationale for significantly altering the distribution mechanism, particularly for reinvestment on the current highway system.

Flexibility

Increased flexibility in the use of Highway Reinvestment funds would result first from the elimination of traditional categorical distinctions. In addition, the same approach to transferring funds into and out of the Highway Reinvestment element of the program would be taken as proposed for the Transit Reinvestment element, i.e. some limited percentage of Highway Reinvestment funds would be available for transit-related reinvestment or capacity expansion.

The amounts or proportion of reinvestment funds that could be devoted to operating efficiency improvements or to bridge maintenance could be set or controlled in any of several ways. Again, a limit could be established so that funds, not to exceed some percentage of those apportioned, could be used for these purposes.

An added element of flexibility is included by allowing some proportion of the available Highway Reinvestment funds to be used to carry out projects of high local priority that are not on the designated metropolitan system. This feature would add an important new degree of flexibility for local officials seeking to bring as many resources to bear as possible on their unique local problems.

3. The Capacity Expansion Program: A Shared Funding Source

While long-deferred maintenance and reinvestment require greater attention and emphasis as part of a new federal program, these needs *cannot* be pursued to the exclusion of efforts to expand both transit and highway capacity. Travel demands already overwhelm our systems and will continue to increase in the years ahead. Additional capacity will be essential to maintain a mobile America into the next century and beyond.

Therefore, the proposed Metropolitan Transportation Program includes a separate element designed to support major capacity expansion on our metropolitan systems. Unlike federal funds provided for reinvestment, federal funds to support major capacity expansion would be made available to the metropolitan area as a shared or pooled resource, without regard to mode.

The single, multi-modal source of funds for major capacity expansion is intended to encourage much stronger integration of transit and highway planning and programming than historically has been the case through today's highly separate programs. The use of a common resource for financing major capacity expansion also is intended to promote more rational tradeoffs between various types of investments and more highly integrated project designs. More cost-effective facilities and services should result.

The approach proposed for supporting major capacity expansion, however, is markedly different than that proposed for reinvestment. The Major Capacity Expansion element of the program has been designed to promote a high degree of multi-modalism whenever metropolitan areas are considering how their systems should be enlarged. The major feature of the program is the shared, pooled, or common source of federal funds from which all major capacity expansion projects, both highways and transit, would be supported in the metropolitan area.

Additional capacity will be essential to maintain a mobile America. Funds to support major capacity expansion should be made available to metropolitan areas to determine which investments are needed.

Figure 4
MAJOR CAPACITY EXPANSION
Metropolitan Transportation Program

A new federal Metropolitan Transportation Program should include a formula program to fund major capacity expansion projects. Project selection and trade-offs between modes would be made at the regional level by local officials in consultation with state officials, and would be funded from a single, multi-modal source of federal funds.

Definition of Major Capacity Expansion

The Major Capacity Expansion element of the program is intended expressly to be the source of funds for all transit projects typically included in the current UMTA definiton of "major capital investments," other than rail modernization. The definition would include new rail systems, transitway and busway projects as well as extensions to existing systems and major expansions of service area. The expansion of bus fleets and services, beyond those needed to maintain transit's current market share also would be funded from this combined federal resource.

The addition of lanes and the construction of new highway facilities on new rights-of-way on the designated Metropolitan system also would be supported from the Major Capacity Expansion element of the program.

Capital Investment Only

Funds for Major Capacity Expansion would be available for capital projects only.

Recipient

The recipient of Major Capacity Expansion funds should be the regional agency designated to develop and approve transportation and related capital improvement programs. Under this arrangement, the lead responsibility for both highway reinvestment and major capacity expansion would reside with the same regional organization.

An option to this approach might be to provide federal funds for major capacity expansion to the states, with project commitments made only after agreement at the metropolitan level on the mix of projects and investments to be undertaken.

Under either option, committed funds would be made available to and/or through the appropriate operating or implementing agency to actually carry out the approved projects.

Allocation of Funds

Federal funds for major capacity expansion would be allocated by formula. The formula must reflect the need for new capacity by using factors that represent growth in total travel demand being experienced in a region. The formula also must reward increased occupancy of all vehicles operating on the transportation network. In constructing a suitable formula, greater weight should be given to factors reflecting increased vehicle occupancy to avoid providing an incentive for increased vehicle-miles of travel.

A variety of factors and data could be used to reflect both travel-demand growth and the increasing use of higher-occupancy vehicles. To the maximum extent possible, data should be available annually and in an easily auditable form to ensure uniformity and to reduce time lags.

Examples of the factors that might be considered in development suitable of formulas for allocating capacity expansion funds include transit ridership, use of all forms of shared-ride services, vehicle occupancy data, motor fuel tax receipts attributable to a region, motor fuel sales, motor vehicle registrations, and others. The major objective in developing a new formula is to ensure that funds flow in relation to need and also in relation to the specific goals to be accomplished.

4. Federal Discretionary Investments

The proposed Metropolitan Transportation Program is designed to function predominently as a formula program supported from dedicated federal funds drawn from motor fuel and related user fees. For a variety of reasons, however, it will remain important to maintain a discretionary program at the federal level.

The most important rationale for federal discretionary spending on transportation is to ensure there is a resource available to support the extraordinary costs of individual projects that otherwise could not be funded through an annual formula apportionment of funds. Many, many examples of such projects can be drawn from recent transit and highway experiences.

Though it is desirable to put transportation capital investments on a regular, recurring cycle through better planning and capital programming, transportation investment needs will continue to be "lumpy" by their very nature. The availability of discretionary funds at the federal level provides a means to respond to this need.

The Metropolitan Transportation Program envisions a discretionary program of limited size, perhaps no more than 10% of the total Metropolitan program funding base. The discretionary program would be multimodal and multi-purpose, and available to support worthy projects for transit reinvestment, highway reinvestment, or major capacity expansion.

Finally, the discretionary program has as its focus, projects that provide demonstrable, positive impacts on the solution of problems declared to be of national significance. Obvious examples include: reduction in vehicles-mile-traveled (VMT) growth, congestion relief, reduction of mobile-source emissions, reduction of safety hazards, direct encouragement of economic development activities, expansion of services to the elderly, those with disabilities or those disadvantaged, or attraction of added sources of non-federal funding.

Figure 5
DISCRETIONARY ELEMENT
Metropolitan Transportation Program

A new federal Metropolitan Transportation Program should include a discretionary element to support projects that cannot be advanced with formula funds alone, and to focus federal resources on projects that address national priorities.

The Metropolitan "System"

Administration of a metropolitan program of the type described will require the identification of a specific metropolitan "system" on which federal funds can be spent. In the case of funds to be used for public transportation, the program envisions that federal funds be available for all forms of transit investment, using the broadened definition of transit highlighted throughout this report.

In the case of federal funds for highways, the program envisions re-evaluation of the current federal aid system in each metropolitan area, and establishment of a new metropolitan system eligible for federal funding.

The process of redefining a metropolitan federal aid system should be guided by local and regional officials, including the selection of criteria for designation, actual route designation, and any subsequent amendments or alternations to the metropolitan system. National guidelines should be provided to assist local officials in this process, with state and federal officials participating fully.

The proposed program assumes that all existing and future segments of the federal Interstate highway system in a metropolitan area would be incorporated into a newly designated metropolitan aid system.

A RURAL PUBLIC TRANSPORTATION PROGRAM

Metropolitan areas of the country are not alone in their struggle to enhance mobility and make progress in achieving other local and national goals. The transportation needs of residents of small urban and rural areas across the country are as immediate and as complex as those that confront the residents of our largest metropolitan areas.

In considering how best to support the transit needs of small urban and rural residents, there appears to be little reason to consider wholesale restructuring of the current federal Section 18 program. Through this program, federal funds are apportioned to the states, which then make funds available to local jurisdictions and transit operators to support programs designed at the local level and reviewed by the state. The funds are available to support either capital or operating investments, at the discretion of the local recipient, via consultation with the state.

The most important change necessary to the Section 18 program is an increase in the funding levels. Clearly the small urban and rural transit assistance program could benefit easily from at least doubling of federal investment.

Although major restructuring of the small urban and rural transit program does not seem to be necessary, essential changes are needed in federal policy that will make the rural transit program more effective, and make more efficient use of federal funds. One of the most important actions that can be taken to increase the effectiveness of available rural transit funds is to streamline and coordinate the use of UMTA Section 18 funds with the federal (and state and local) human services programs for transportation of specific client groups. Recent experience repeatedly reveals that efforts at integrating rural transit services, combining available resources, and consolidating program management and administration are thwarted by myriad program-specific requirements that often are contradictory or irreconcilable once funds are in the hands of local program sponsors and managers.

The entire system of transportation assistance to small urban and rural residents, regardless of its purpose, needs to be reviewed and better coordinated. Enormous increases in the cost-effectiveness of federal rural transportation investment appear to possible.

A CONSOLIDATED TRANSPORTATION TRUST FUND

Current transportation programs at the national level are characterized by a high degree of separateness between modes and the existence of separate, and often competing, sources of federal funding.

The existence of separate programs and funding sources for each mode prohibits effective intermodal and/or multi-modal planning and decision-making to a considerable degree. In addition, modal transportation interests historically have been preoccupied with protecting and enlarging their individual funding base at the expense of other transportation interests. As a consequence, inadequate attention is paid to the overall priority of transportation within the federal budget. The result is that transportation investment at the federal level has diminished as a national priority at a time when its importance should have been promoted aggressively by the entire community of transportation interests.

At the same time that the priority of transportation investment has declined at the federal level, mounting concern over the condition of all forms of public infrastructure has prompted growing efforts to create a broad class of federal infrastructure assistance and support. One possible consequence of heightened interest in federal support for infrastructure generally, is that transportation investments and funding sources may be diverted to a wide range of other infrastructure systems and facilities.

The work of the Transit 2000 Task Force and other groups suggests strongly that transportation investment should receive greatly increased priority in the years ahead. The challenge is to design a policy and programmatic framework that strengthens rather than diminishes or diffuses the priority of transportation and at the same time, provides for increased flexibility in the use of available funds. The previously described Metro-

Figure 6
CONSOLIDATED TRANSPORTATION TRUST FUND CONCEPT

politan Transportation Program meets these challenges; but there are other, more far-reaching ideas that deserve consideration.

One approach may be to create a consolidated transportation trust fund at the federal level. Figure 6 graphically depicts the basic structure of such a program.

A consolidated transportation trust fund could provide a means to join multiple transportation interests and better serve the specific transportation needs of the nation without trading-off or subordinating those needs to other legitimate infrastructure demands. A consolidated trust fund could provide fully dedicated funding for most programs now included within the current U.S. Department of Transportation budget, with the exception of the Coast Guard. A variation would exclude the federal aviation program—both capital and FAA operations—and maintain federal air transport system investments through a separate program.

Relaxation of the rigid ties between discrete sources of funds and the transportation uses to which they can be put is a major feature of the Consolidated Transit Fund concept. Separating decisions over the mix of revenue sources to be raised from decisions over how funds are to be allocated might result in a more rational debate over the transportation needs and priorities and the means by which those needs should be met.

The concept of a Consolidated Transportation Trust Fund at the federal level would introduce a host of complex and difficult questions. The potential complexities of transitioning to such a program, however, have been addressed in a number of states where similar programs already are in place.

Whatever new program structure emerges, it is time for the separateness of modes and funding sources to be relaxed at the federal level. The experience of the several states with consolidated transportation funds, and other forward-looking approaches to transportation investment, represents a model that should be considered in restructuring the federal surface transportation assistance programs.

5. INVESTMENT REQUIREMENTS

The most important tool in addressing the goals and objectives of a new federal transportation program is the amount of direct investment made in the nation's transportation systems and services—both highways and transit.

The Past Decline in Federal Investment

By any measure, the priority and level of federal investment in transportation, has declined in recent years. The pattern is most pronounced, however, in the trend of federal investment in public transportation.

In 1981, the federal transit budget was $4.6 billion; today it is less than $3.2 billion. The reduction in absolute dollars translates into a loss of more than 50% of actual purchasing power when the effects of inflation are considered. As a result, the federal government now provides barely 20% of all transit investment, while a decade ago the federal government provided nearly 40%.

Despite the decline of federal support, total national investment in transit has risen over the decade. In 1987 over $16 billion of transit investment was made compared with a total of $12 billion in 1981. This was made possible by an increase in state transit funding of nearly 100% and an increase of 50% in local transit funding over the same period. Clearly, public transit remains a high priority at the state and local levels, in stark contrast to the retreat from transit reflected in recent federal budgets. Balance in the transit funding partnership must be restored and major increases in transportation and transit investment sought in the future.

How the federal surface transportation assistance program is restructured is dependent directly on the amount of funding that is made available through the program. Little or no change in the overall level of federal investment in transit and highways makes substantial restructuring of the programs difficult, if not impossible. Without increased investment, programmatic change will be limited to marginal or incremental adjustments to current programs. This approach likely would not advance the goals or solve the problems that we now confront.

In a very important respect, therefore, a major infusion of additional federal investment is necessary, not only to meet urgent facility and service needs, but to foster major reorientation of federal policy and programs of the magnitude proposed in the Metropolitan Transportation Program.

While there is debate over the timetable for providing increased federal investment, there is strong consensus and justification for the proposition that overall investment should be doubled, and that the relative share of investment flowing from federal sources should not be reduced below levels reflected in current federal policy.

A Target for Increased Investment: Expanding Transit's Role and Ridership

Increased transportation investment will require a clear statement of what must be accomplished with additional resources. Linking transit use to the achievement of national goals provides a new and essential clarity of purpose.

One key to progress in meeting the broad range of national goals is to increase vehicle occupancies by accommodating *major* increases in the use of transit and other forms of high-occupancy, shared-ride services in the years ahead. Substantial increases in total ridership and market share must be sought.

To better size the overall investment that will be necessary to expand transit use and meet these goals, the Transit 2000 Task Force analyzed a series of alternative scenarios linking aggressive goals for expanding ridership to estimates of the investment required to meet these goals. The scenarios were built around alternative assumptions about the amount of increased transit ridership that might be sought, the varying mix of traditional and non-traditional services that might be required to effectively serve a substantial increase in riders, and the estimated investment that would be necessary to expand the mix of services.

One key to progress in meeting the broad range of national goals is to increase vehicle occupancies by accommodating major increases in the use of transit and other forms of high-occupancy, shared-ride services.

Ridership Goals

Present transit ridership in the U.S. is approximately nine billion trips per year.

Five different approaches were taken to establish goals for increased ridership beyond current levels between 1990 and 2020. Alternative ridership goals focus on increasing the transit market share of work trips to 10% and 15%, respectively, with proportional increases in non-work trips; expanding ridership to achieve levels equivalent to the seventy-fifth percentile for urbanized areas based on current population, population density, and ridership; accommodating all travel growth that is projected to take place under congested conditions through 2005; and, achieving the same level of per capita transit use that now is being accommodated in Canadian cities, adjusted for population size.

These alternative ridership goals involve attracting and serving from 9.7 billion additional trips a year, to attracting and serving an additional 17.4 billion trips per year under the most ambitious assumptions. This range of ridership goals requires more than doubling current levels of transit use.

Mix of Transit Services

To accommodate the alternative levels of increased transit use, three different approaches were taken to identify the mix of transit services that might be provided. The three approaches included maintaining the existing pattern of use among transit and other shared-ride services provided by transit agencies in the U.S., adjusting current ridership to reflect more directly the type and mix of services currently available in individual urbanized areas, and assigning a substantially increased share of the additional trips to vanpools, busways, HOV lanes, and other non-traditional types of services to better serve the increasing travel demands in suburban-type settings where traditional transit services might not be expected to attract substantial increases in ridership.

Investment Requirements

Each scenario describing alternative ridership goals and mix of services was analyzed with respect to the direct capital and operating investment necessary to support the projected ridership increases. Cost estimates were based on a mid-range estimate using current average costs per passenger and a low cost estimate using costs per passenger at the twenty-fifth percentile.

Figure 7
TRANSIT INVESTMENT REQUIREMENTS

FEDERAL INVESTMENT: THE METROPOLITAN PROGRAM

Transit 2000 estimates confirm the need to increase total federal investment in transit and highways by more than 100%. Today, U.S. Department of Transportation spending includes $16.7 billion annually, $3.2 billion for transit and $13.5 billion for highways. The recommended Metropolitan Transportation Program calls for a total federal metropolitan transportation investment of not less than $25 billion per year and as much as $34 billion, based on combined estimates of transit and highway needs.

Transit Investment Requirements

As part of the Metropolitan Transportation Program, federal investment for public transportation should be increased to at least $11 billion annually, including roughly $5.7 billion for essential reinvestment and $5.2 billion for capacity expansion. In arriving at the recommendation that federal transit investment should be set at $11 billion annually, a conservative set of assumptions was used, reflecting:

- a commitment to reduce the current backlog of transit reinvestment requirements and ensure a regular cycle of rehabilitation and replacement based on industry projections from current capital programs;
- a commitment to more than double current transit ridership to a level comparable to current per capita transit use in Canada;
- a commitment to increasing the proportion of transit trips on vanpools, carpools, high-occupancy lanes, and other shared-ride services to at least 15% of all transit trips served by transit agencies; and,
- cost factors that reflect the current median costs of various service options.

A more ambitious set of ridership goals and cost estimates adjusted for future inflation would require a level of federal investment in transit significantly above the $11 billion annual figure.

Even without a national commitment to substantial increases in transit ridership, however, the federal transit program must be increased from $3.2 billion to *at least* a range of $6 billion to $8 billion per year. This *minimum* level of federal transit investment is necessary to meet the reinvestment requirements of existing systems and services, to continue major new projects that are already in the advanced stages of planning and development, and to fulfill new federal requirements for services to those with disabilities, the introduction of low emissions technology, and a host of new federal mandates.

An annual investment of $6 billion to $8 billion is necessary to restore recent declines in the purchasing power of federal assistance as a result of inflation and funding reductions since 1981. In 1981, federal transit assistance totaled $4.6 billion. Simply adjusting that level of support to 1989 dollars would require a *minimum* federal program of $6.5 billion annually to meet a combination of reinvestment and capacity expansion needs.

Highway Investment Requirements

Depending on the assumptions used, figures compiled by the American Association of State Highway and Transportation Officials (AASHTO) indicate a need for urban federal highway reinvestment that ranges from over $8 billion annually to nearly $13 billion. Federal support for highway capacity expansion could require an additional $10 billion per year, if scenarios for "fully improved service" on the nation's highways are to be pursued.

FEDERAL INVESTMENT: THE RURAL TRANSIT PROGRAM

As indicated earlier, the need for public transportation services in the nation's small urban and rural areas far exceeds current resources. Federal assistance directly to rural public transit should be at least double the $70 million to $80 million now provided annually. In addition, the substantial amounts of transportation spending from federal human services programs should be combined more effectively with direct investment by the U.S. Department of Transportation.

The scope of our nation's transportation needs is enormous. The consequences for the nation of not acting aggressively to meet them is increasingly serious. As a result, the federal government must be called on once again to take the lead role, not only in setting goals and establishing new policy direction, but in providing the necessary financial resources to spur overall transportation investment.

SOURCES OF FUNDING

Federal Investment: Increased User Fees

Federal motor fuel taxes and associated user fees have been the primary source of funding for the nation's highway program and a major source of support for transit since 1982. Increased federal funding necessary to support the levels of transit and highway investment envisioned in the future should continue to come from this basic source. Increases in federal motor fuels taxes therefore, are required and should be enacted permanently, in 1991, concurrent with reauthorization of the federal Surface Transportation Assistance Act.

Support for a $25 billion to $34 billion level of federal investment would require a motor fuels tax increase equivalent to 8¢ to 16¢. To ensure federal transit investment of $11 billion annually within a new Metropolitan Transportation Program would require 7¢ of motor fuels taxes be available for transit investment in addition to current levels of federal transit support. To bring federal transit investment up to minimum need levels—$6 billion to $8 billion per year—will require the equivalent of another 5¢ of federal motor fuels taxes dedicated to transit.

As deliberations proceed over how to solve the nation's budget deficit, how to restore investment in our public infrastructure, and how to meet transportation needs, traditional transportation user fees must be increased immediately and rededicated exclusively to transportation investment.

Non-Federal Finance

While increased direct federal transportation investment must be the centerpiece of a new national policy, overall transportation investment has been, and must remain, a partnership among federal, state, and local governments, the private sector, users, and others that benefit from enhanced mobility and high quality systems and services.

Direct federal investment in transit and highways must serve two purposes. First, it must directly underwrite major projects and improvements. As importantly, however, federal investment must serve as a catalyst to attract stable and reliable financial commitments from local and state government and the private sector. The goal of bringing added non-federal resources to transportation should be a prominent part of new national policies and programs.

The most effective way to serve this goal is to incorporate into federal policy and programs a comprehensive series of fair and equitable incentives to attract greater state and local funding, increased financing from private sources, and increased financial participation by users and beneficiaries. As part of this effort, consideration should be given to new pricing mechanisms that recover more of the costs of services and facilities, particularly the costs of automobile and highway use. In addition, federal allocation mechanisms must reward increased investment without disadvantaging communities that may be struggling economically.

In addition to the provision of more effective financing incentives, an effort must be made to remove the current disincentives to increased transportation investment that exist in federal policy. Transit agencies, for instance, must be allowed, encouraged, and rewarded for seeking increased revenues from non-traditional sources, including new types of services, real estate and development activities, and other sources.

Future transportation needs—both transit and highways—require a comprehensive financial strategy guided and underwritten by federal policy and direct investment.

Federal investment must serve as a catalyst to attract stable, reliable financial commitments from state and local government and the private sector.

6. SUPPORT FOR TRANSPORTATION INVESTMENT

It is increasingly important that direct investments in transit be supported strongly by other public policies and that efforts be made to maximize transit use. Today unfortunately, a number of public policies, including federal tax provisions, national energy policy, and local land use and development controls severely undermine the effectiveness of our transportation investments and greatly damage the efficiency of our entire transportation system. Those policies should be eliminated and incentives to increase the use and effectiveness of our transportation investment should be adopted.

In other areas such as technology, human resources, research and development, we have failed to address fully transit and transportation needs.

New federal transportation programs and other federal policy and legislative initiatives must resolve these contradictions and be more responsive if our direct transportation investments are to be effective.

Federal Tax Provisions

Current federal tax provisions limit overall investment in and the effectiveness of transportation facilities, particularly public transportation services. A host of federal tax provisions discourage private investment in transportation facilities, greatly restrict the financing powers and options available to state and local governments, and raise the cost of state and local borrowing for infrastructure investment. Current tax provisions governing state and local bonding ceilings, limitations on private participation in public facility finance, arbitrage restrictions, sale/leaseback transactions among others should be reviewed carefully and refashioned to support new national transportation goals and policies.

In addition, fringe benefit provisions of the federal tax code provide a significant economic incentive for automobile use and a disincentive to increased transit use. Current tax law allows employer-subsidized free parking, which may be valued at several hundred dollars per month, to go untaxed totally, while those who receive employer-subsidized transit passes are taxed fully once the value of monthly employer support exceeds $15 dollars. This imbalance must be remedied.

As part of the effort to rewrite federal transportation programs and policies, federal tax law must be rewritten to support rather than undermine greater investment and use of public transportation.

Land Use and Development Coordination

Land development patterns dictate the nature of our travel demands. Therefore, to enhance mobility and freedom of movement, greater attention must be paid to how land uses and development are arrayed across the landscape. It is imperative that we aggressively promote and provide incentives for development that can be served by public transportation more easily and effectively. Concentrating development, more mixed-use development, supportive parking requirements, policies and pricing, and attention to a host of critical site and building design features all are required.

Better coordination of transportation and private development presents enormous opportunities to manage travel demand, reduce public investment requirements, share costs, and achieve greater use and efficiency from all transportation facilities and services.

Better coordination of transportation and private development through local planning and development controls presents enormous opportunities to manage travel demand, reduce public investment requirements, share costs, and achieve greater use and efficiency from all transportation facilities and services.

Across the country there are a growing number of examples of how this is being done. New federal transportation programs should encourage these efforts and ensure that both transit and highway investments are premised on broad-based strategic plans for regional development and on the existence and implementation of effective land use plans and development controls.

Clean Air Policy

The nation's Clean Air Act soon will be revised and extended to provide new direction in restoring the quality of the nation's air. Historically, federal clean air initiatives have concentrated exclusively and effectively on the technological means for reducing tail pipe emissions but largely have been silent on the impacts of growing travel demand. Within the next five years, however, growth in vehicle-miles of travel will result in increased emissions that will *not* be off-set by new tail pipe technology. As a consequence, air quality will worsen.

A pronounced shift in our transportation air quality strategy must be made to deal more aggressively with travel growth and travel behavior. Both clean air policies and transportation policies should be coordinated to embrace actions that reduce travel demand where possible, restrain the growth in vehicle-miles of travel, and aggressively promote options to single-occupancy vehicle use. Particularly in areas now suffering the most severe air pollution, federal transportation funding ought to be shifted to investments that accomplish these ends more directly.

With mobile source pollution from motor vehicles again on the rise, a pronounced shift in our transportation air quality strategy must be made to deal more aggressively with travel growth and travel behavior.

With ever-increasing fuel use from motor vehicles, national transportation and energy policy must be coordinated closely to achieve mobility and energy goals.

National Energy Policy

Among the most significant factors affecting our choice of transportation options is the cost of various modes of travel, both to the rider and to the community as a whole. Today, as an expression of unstated national policy, we price gasoline at levels far below those that exist in other countries around the world. In essence we subsidize and, therefore, directly encourage low-occupancy automobile use.

At the same time that artifically low energy prices act as an economic incentive for increased low-occupancy automobile use, we fail to recover the full cost of automobile use or account fully for the consequences of reliance on low-occupancy, personal vehicle use. We have held the price of energy artificially low and have underestimated grossly the costs that must be borne for use of petroleum fuels.

National transportation and energy policy must be coordinated closely and brought into synch with respect to pricing and costs before the marketplace will promote the type of activity and behavior that is required to achieve our mobility goals as well as other major national goals affected by transportation decisions.

Technological Innovation

Conclusions to date from the work of the Transit 2000 Task Force suggest that technological breakthroughs directly applicable to public transit operations will be marginal in the short term. Perhaps the most significant potential changes over the next decade, however, have to do with fuel and propulsion technologies.

There is growing interest in alternative fuels generally, and, specifically, in their introduction into the transit market. Numerous demonstration programs throughout the transit industry are exploring the potentials of new, low-emissions technologies of all types. The problem posed by moving rapidly to alternative fuels or other low-emissions technology, particularly within the time frame of new federal transportation and clean air legislation (1991-94) illustrates well the difficulty of bringing new technologies to bear on our transportation problems.

With respect to the use of alternative fuels and other low-emission technologies in public transit, the gap that exists between laboratory testing and full and effective commercialization poses a series of major problems.

Transit managers directly are responsible for maintaining rigid service schedules and reducing the cost of services provided. At this time, alternative fuel and low-emissions technology has not proven to be reliable or durable enough in daily revenue service to justify wholesale conversion, nor have these technologies proven to be economical under foreseeable market conditions.

This current situation provides an example of how widely held goals and objectives can clash—the drive for lower emissions, the need for reliable service, and the need to reduce, not increase costs. National policy must provide a means to resolve these contradictions and assist in making critical trade-offs. The inability to make such trade-offs may retard operational performance of our transit systems, diminish the availability of basic services and the achievement of energy and air quality goals.

In addition to technologies that can be introduced directly into the transit market, technological innovations that impact the economy, personal lifestyles, and other transportation modes will affect public transit as well. "Smart cars—smart roads" programs, other communications technologies, cold fusion, and magnetic levitation, along with a host of other emerging technologies may influence or alter travel patterns or the means by which we serve them. The timetables for bringing these technological advances to market, however, are unclear.

Research and Development

In addressing the prospect and pace of technological innovation, a major issue to be explored in a new national transportation policy is how the research and development process will be directed, monitored, and underwritten. The promise of technological innovation is only as bright as the strength of the commitment to research and development.

Unfortunately, the economic incentive for private suppliers to innovate aggressively on a broad scale for the public transit market is extremely weak. The lack of a strong federal commitment to research and development, the decline and uncertainty in federal transit funding generally, and that fact that domestic suppliers of transit equipment frequently are subsidiary organizations operating under larger corporate umbrellas, means that the transit market often is viewed as high-risk, low pay-off, and fraught with uncertainty. These circumstances require a renewed and expanded federal commitment to basic technological and operations research on behalf of public transportation.

The need for such a commitment extends beyond the usefulness of new technologies to transit operators. The precarious nature of the transit industry as a market for sales of equipment and services has a more

New technologies will affect travel behavior, the services provided and manpower requirements.

far-reaching, negative economic consequence of national proportions – the potential demise of the domestic transit supply industry. In addition to the growing importance of transit, federal support of research and development can be justified to ensure the survival of a vigorous domestic supply industry and the jobs and revenues that industry creates. Stepped-up federal support for basic research and development in partnership with suppliers of equipment and services should be a major feature of a new national transportation policy and program.

A recent report from the Transportation Research Board, entitled, "Research for Public Transit: New Directions," outlines the scope and content of such a program. The recommendations of this report should be used as a blueprint to develop a new federal initiative on transit research and development. The report identifies a number of areas where expanded research will be essential, including human resources, service configuration and marketing, service delivery models, internal efficiencies, maintenance, equipment, and finance.

Human Factors

Public transportation is dominated by its human resource and human service character. The performance and success of public transit hinges on how human factors are managed. There are two dimensions of concern – riders and work force.

The needs of individual riders and the various characteristics of travel markets dictate the nature, scope, and design of services. The characteristics, desires, and behavior of existing and potential transit users are therefore, of critical concern in assessing the future directions of transit and federal transportation policy. More and much better information on travel demand, behavior, and markets will be vital in order to design and put in place services and facilities that will enhance basic mobility and contribute to the achievement of other national and local goals. National policy should promote and underwrite the extensive efforts needed to maintain an effective data base.

Equally important, the management and operation of transit services is highly labor-intensive. Seventy to eighty percent of transit expenditures typically are associated with labor-related costs. The quality of services, therefore, is directly dependent on the skills that are brought to the job by both management and labor, the price paid for those skills, and the degree to which those skills are used to their full potential.

Long-standing recognition of the overwhelming importance of the human factors in public transportation has led to a number of observations by the Transit 2000 Task Force on human service issues.

With respect to the transit work force and the industry's personnel needs, it is clear that by the year 2000 and beyond, America's work force will be dramatically different. Like other industries, transit must rethink how it attracts, retains, and uses its human resources.

Coupled with the predicted labor shortage, the numbers of women and minorities in the work force will increase. Women will comprise 47% of the total work force by the year 2000, and minorities will account for one-third of all new workers. Immigrants will continue to enter the labor force in numbers greater than at any other time since World War I. The average age of workers will continue to increase.

In response, the transit industry and national policy must value this diversity as never before. Training programs, focusing on basic and language skills as well as skills-building in new technologies, need to be instituted. Non-traditional employee benefits such as flextime and child care need to be tailored to the new work force. Transit will need to become more involved with local educational systems to ensure the existence of quality, industry-specific vocational programs. Finally, transit must create sound and well-publicized career and upward mobility programs grounded in the principle of equal opportunity.

The challenge for transit is to identify the required skills and recruit and retain its work force in an increasingly competitive environment. Just as importantly, it is necessary to provide the motivation that will stimulate creative thinking, encourage employee initiatives, sustain high expectations, and draw the full potential from the work force – both management and labor.

The tools to pursue these goals involve financial resources, new organizational models, and new management techniques. Clearly, a new generation of national transportation policies must recognize the importance of moving ahead on the human resources front by directly supporting these efforts and acting as a catalyst to address the industry's human resource needs most effectively.

The earlier mentioned report of the Transportation Research Board also addresses human resource issues, outlining the effort necessary in a research context, to assist human resource development and management as part of a broader federal policy and program initiative.

Across a variety of policy areas, there are major opportunities to reinforce the goals to be achieved through increased direct investment in transit and transportation. Coordinated and supportive action on all these fronts is essential in the years ahead.

7. MEASURING PERFORMANCE AND GAUGING SUCCESS

The performance and efficiency of our entire transportation system is declining significantly under the pressures of increased travel demand, inadequate investment, and lack of a strategic vision. New national transportation policies and programs must reassess what constitutes performance and success.

The 25 years since the federal transit program was enacted has been a period of transition. In that period, the goals of the original federal program largely have been achieved. Initial reinvestment in failing plant and equipment was made. Declines in ridership have been halted and reversed, and fares have been kept at levels that do not discourage transit use further.

Over the 25 year period, however, the contributions of transit to the achievement of emerging national goals have increased dramatically. At the same time federal requirements imposed on transit systems have mushroomed, resulting in increasing costs, limiting the ability to raise revenues, and diminishing opportunities to increase ridership.

While the scope of these contributions and requirements has expanded, the yardstick for measuring success in the provision of public transit services has remained narrow, reflecting only a concern for the economic efficiency of daily operations. It is now time to redesign the yardsticks that measure the value and success of our transit investments based on a broader view of the critical role transit plays in meeting national goals, and a better understanding of how federal (and other governmental) requirements adversely affect system efficiency.

A Two-Tiered System of Performance Measurement

A broad-based goal framework is necessary for assessing the performance and success of public transit in the future. Major national goals and more specific local goals and priorities must be reconciled and accommodated in assessing the success and value of a new transit program.

The creation of a two-tiered system of performance measurement could provide the means to link national and widely varying local goals. The first tier should focus on basic national goals and a limited number of objectives and measures that can be used to gauge how transit and transportation decisions serve those goals. The second tier would focus on a more expansive set of local and regional goals, objectives and measures developed from a strengthened strategic planning process at the local and regional levels, including continued attention to the issues of operational efficiency.

Regardless of the mix of goals established nationally and in our individual communities, the single common transportation theme is wiser accommodation of increased travel demand. For a host of reasons, we must seek to serve growth in passenger travel *without* necessarily accepting unrestrained growth in vehicle trips.

Unless we can serve increasing passenger-miles of travel (PMT) and reduce the growth in vehicle-miles of travel (VMT) in the process, it will be impossible to improve significantly the operating efficiency of our highways and transit systems, meet clean air standards, serve social goals, reduce energy dependence, or sustain economic growth.

Better management of the relationship between VMT and PMT is essential in the years ahead, and increased vehicle occupancy is the central means of doing so. Increased vehicle occupancy must, therefore, lie at the heart of a new system of measuring success in transportation and transit investment.

Tier 1: The National Performance Perspective

Our basic national goals (and current problems) lie in several areas, including economic growth, environmental quality, energy independence, mobility, and the provision of basic human services.

The scope of federal oversight of transit performance should be broad and related directly to these few, basic goals and objectives. The national focus should be on information directly related to progress in achieving national goals. The national transit information base should include ridership and market share data, vehicle-occupancy data and travel time data. With this information, essential calculations can be made to identify reductions in vehicle emissions, energy use, congestion, and contributions to other national goals.

The federal government should *not* be involved in micro-managing or micro-measuring daily operations of transit systems. Over-emphasis at the federal level in recent years on data collection and calculation of internal operating efficiencies increasingly is inappropriate in light of: a) increasing federal mandates that add cost, restrict revenues and retard ridership, therefore reducing efficiencies; b) the lack of financial support to carry out mandates that negatively affect operating

performance; and c) the dominance of *non*-federal funding (now 80%) that supports transit services, a situation which suggests that judgments about operational matters and resource use be exercised more fully at the local level by those who pay the largest share of the bill.

Tier 2: Local Performance Perspective

The local tier of performance measures must be designed to reflect directly the unique mix of local goals, circumstances, and priorities.

Increased use of high-occupancy, shared-ride services should be a goal for all communities and transit agencies. The emphasis placed on that goal and the degree to which it can be achieved, however, may vary considerably from area to area.

Figure 8 illustrates how varying circumstances might lead to substantially different goal orientation for transit within individual communities. The changing mix of local goals must be accommodated in any system designed to monitor the success and performance of our transportation and transit investments.

One approach to sorting out the mix of goals at the local level is to promote or require, as a matter of federal policy, greater attention to long-range, regional strategic planning. Reinstituting a broader, strategic focus as a condition of federal transportation investment will encourage integrated consideration of the forces, factors, goals, and priorities affecting a particular community.

A stronger strategic planning function also will allow more effective public policy trade-offs to be made at the local and regional levels. These trade-offs might focus on land use controls versus transportation investments, highway versus transit strategies, public investment versus private investment, the needs of one travel market versus another, the requirements of one subarea versus another, the cost and priority of transportation versus other public services, development density, and design versus the level of public infrastructure investment. A strategic planning process also would provide an opportunity to relate more clearly local and regional goals to national goals. A host of communities recently have completed strategic planning programs with these purposes in mind.

Within tier two, a renewed commitment to quality, performance and economic efficiency in transportation investments continues to be of central importance in the years ahead. Assessments of economic efficiency however, must recognize that a number of specific

Figure 8
VARIATION IN TRANSIT MISSION TO REFLECT
VARYING LOCAL CIRCUMSTANCES AND PRIORITIES

Figure 9
TRANSIT PRODUCTIVITY AND PERFORMANCE,
1970–1980

requirements and circumstances directly increase costs, reduce revenues, and restrain ridership growth:

- Increased congestion and the lack of separate rights-of-way or preferential treatment for transit and high-occupancy vehicles dramatically slows transit services operating in mixed traffic;
- Many of our traditional land use patterns and development controls substantially reduce the market for and the attractiveness of transit or other shared-ride services;
- Our continuing national commitment to numerous social and environmental goals including service for the elderly and those with disabilities, and the introduction of low-emission technologies increase costs;
- Numerous federal program requirements adversely affect performance, including charter and school bus restrictions that reduce revenue and ridership, low-bid procurement processes that result in incompatible equipment, and increased costs to maintain it; and,
- The public service nature of transit acts as a significant roadblock to maximum economic performance due to public expectations, priorities, and requirements for reasonable fares, frequent service, and broad service coverage. Each of these expectations introduces a conflict with the achievement of maximum economic efficiency.

Within the current setting, narrow use of aggregate cost, revenue and ridership data, give a distorted picture of performance. Transit has, for the most part, performed quite well under the complex circumstances that confront transit managers. The accompanying graphic clearly illustrates the progress that has been made as the intergovernmental partnership in transit has matured.

In considering the types of measures to be monitored in an operational setting, the measures in Figure 10 are considered to be of major significance by most transit managers. The most useful way of using these measures is either to monitor progress against previous years' performances or to measure progress against preestablished goals or standards set locally. Peer group comparisons also are useful, if varying conditions and circumstances among the communities being compared are taken into account properly.

A local or regional system of performance monitoring and measurement that includes attention to internal operating efficiency also must go beyond aggregate system-level data. Mobility and related problems often are concentrated in particular locations and occur at particular times. Local or regional performance measurement systems must be designed to allow observations at a suitable, disaggregated level. Information for particular corridors, specific sub-regions, peak hours, etc. is required. The ability to make disaggregated analyses is critically important for public transportation, where the greatest advantages are likely to emerge from efforts to address specific markets and subregional problems.

Figure 10
BASIC MEASURES FOR ASSESSING INTERNAL OPERATING EFFICIENCY

- Passenger per Vehicle-Mile
- Passenger per Service-Hour
- Passenger per Employee

Summary

A two-tiered approach to assessing the effectiveness and performance of our transportation investments could provide a much more useful policy and management tool in the years ahead. Linking such a measurement system with a carefully designed series of incentives could further promote actions to enhance transit performance and clearly determine what investments, both transit and highways, are most effective and desirable in meeting both national and local goals.

Our entire transportation system must be managed with renewed attention to both operational efficiency and success in meeting broader goals. To fulfill the highest standards of public stewardship, the transit industry is dedicated to:

1. A two-tiered concept of performance-based management that effectively relates performance to both major national goals and to the varying local goals to be served by each of our transit and transportation systems;
2. Strengthening our investment in human resources, and enhancing the qualifications, skills and capabilities of the entire transit work force, including policymakers, managers, and operations personnel; and,
3. Expanding research and experimentation in management and administrative practices, operations, and technology.

A continuing commitment to improving quality and performance is vital in order to serve the traveling public fully, and to make claims on the public and private resources necessary to improve and expand transit services and enhance mobility.

Appendix
TRANSIT 2000 BACKGROUND PAPERS

Throughout the course of the Transit 2000 project, a variety of background papers and related information have been prepared which explore in greater detail the issues and ideas presented in this report. The following material was prepared by Transit 2000 working groups and by other APTA committees on behalf of the Transit 2000 Task Force. They are available through the American Public Transit Association Information Center.

1) "Major External Influences and Their Threats and Opportunities: A Summary Report of the Transit External Environment Working Group."

2) "The External Environment of Public Transit to the Year 2000: A Speculative Assessment," prepared for the Transit 2000 Task Force by Alan Pisarski, January 1988.

3) "Demographic Factors and the Future Demand for Public Transit," prepared for the Transit 2000 Task Force by Dr. Gregory Spencer, January 1988.

4) "Energy and the Environment," prepared for the Transit 2000 Task Force by the New York City Department of Environmental Protection and the Mayor's Office of Energy and Telecommunications, January 1988.

5) "Issues and Opportunities for Transit: An Exploration of Changes in the External Environment and Land Use and Development Trends," prepared for the Transit 2000 Task Force by Elizabeth Deakin, January 1988.

6) Interim Report of the Transit 2000 Task Force, October 1988.

7) Executive Summary of the Interim Report of the Transit 2000 Task Force, September 1988.

8) "The Mission of Transit in the 21st Century: A Summary Report of the Transit 2000 Mission Working Group."

9) "Measuring Performance and Success in Transit: A Summary Report of the Transit 2000 Performance Working Group."

10) "Forces and Factors that Influence Performance in Public Transit: A Background Paper by the Transit 2000 Performance Working Group."

11) "Transportation Management Association," Public Transportation Partnership for Tomorrow," a staff paper prepared for the Transit 2000 Task Force.

12) "Federal Programs and Policies for the 21st Century: An Advance Report of the Transit 2000 Intergovernmental and Finance Working Group."

13) "Transit Investment Requirements," a staff paper prepared for the Transit 2000 Task Force.

14) "Transportation and Air Quality," prepared by Transit 2000 and allied Transportation and Environmental Interests.

15) "Building Better Communities: Coordinating Land Use and Transit Planning," a brochure produced for the Transit 2000 Task Force by the APTA Policy and Planning Committee, September 1989.

16) "Land Use and Transit Planning: Workbook of Approaches and Techniques," produced for the Transit 2000 Task Force by the APTA Policy and Planning Committee.

17) "Transit and Air Quality: A Monograph on Emissions Reductions," produced for the Transit 2000 Task Force by APTA staff.

March 21, 1990

The Honorable Norman Y. Mineta
Chairman, Surface Transportation Sub Committee
House Public Works Committee
Washington, D.C. 20515

Dear Mr. Chairman,

On March 20, 1990 I had the privilege of appearing before your subcommittee as a member of a panel representing the American Public Transit Association. My specific role was to represent the views of APTA's Associate Members, which for the most part, consists of equipment suppliers, engineering firms and consultants.

In responding to your question on the impact of future funding levels on the supplier side of our industry I neglected to include a very important point. The APTA Associate Members strongly support increased funding for transit research and development. This view is also shared by the public operator members of APTA.

There is a very clear need for research into new technology introduction and innovative techniques if the industry is to remain competitive with world suppliers. Such research takes on even greater meaning if the industry is to develop, test and manufacture equipment that will meet the clean air standards now being mandated in many of our major urban areas.

As part of the term "research and development" we include not only hardware and equipment needs, but also the need for improved human resource projects as well as providing better training for managerial, technical, professional and supervisory personnel.

We seek your personal support, and that of your subcommittee, for an authorized R&D funding level that bears some percentage relationship to the overall funding for mass transit. This would be similar to the way research is funded in the highway program. While not yet agreeing on what that percentage should be, APTA considers three percent of the total transit program to be within an acceptable range.

It would be appreciated if you would make this matter a part of the record as you consider the reauthorization of the Surface Transportation Assistance Act.

With appreciation and best wishes for your continued success.

Irving P. Smith

REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

THURSDAY, MARCH 22, 1990

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON SURFACE TRANSPORTATION,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, DC.

The subcommittee met, pursuant to notice, at 10:05 a.m. in room 2253, Rayburn House Office Building, Hon. Norman Y. Mineta [chairman of the subcommittee] presiding.

Mr. MINETA. Before we begin, I will insert into the record at this point, the summary of subject matter for today's hearing.

38-253 O—91——42

SUMMARY OF SUBJECT MATTER
SUBCOMMITTEE ON SURFACE TRANSPORTATION
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
HIGHWAY SAFETY PROGRAMS
2253 RAYBURN HOUSE OFFICE BUILDING
THURSDAY, MARCH 22, 1990
10:00 A.M.

The Highway Safety Act of 1987, Title II of the Surface Transportation and Uniform Relocation Assistance Act (STURAA) of 1987, authorizes funds for highway safety programs administered by the National Highway Safety Administration (NHTSA) and the Federal Highway Administration (FHWA).

Section 402

Section 402 was created by the Highway Safety Act of 1966, Public Law 89-564. States must establish highway safety programs that comply with guidelines which the Secretary, by rulemaking, has determined to be most effective in reducing accidents, injuries, and deaths. Only those programs identified are eligible for Section 402 funding. The following programs are eligible for Section 402 state and community funding grants:

NHTSA-administered Program Area

(1) Occupant protection
(2) Alcohol and other drug countermeasures
(3) Police traffic services
(4) Emergency medical services
(5) Traffic records
(6) Motorcycle safety

FHWA-administered Program Area

(1) Roadway safety

Two percent of 402 funds are set aside for seat belt programs and 20 percent for 55/65 mph speed limit enforcement. The Act permitted states to raise the speed limit from 55 mph to 65 mph on rural segments of the Interstate Highway System located outside of municipalities of 50,000 population or more. Highways posted at 65 mph are not subject to enforcement requirements. The Subcommittee will be considering proposals for establishing a speed limit compliance requirements for both 55 and 65 mph posted highways.

Section 403

NHTSA-administered Program Area

Section 403 was also created by the Highway Safety Act of 1966. NHTSA receives funds under section 403 to conduct safety research. The research includes the collection and analysis of data to determine the relationship between driver performance characteristics and crashes causing death and personal injury.

FHWA-administered Program

FHWA receives funds under section 403 to engage in research in all phases of the FHWA-administered highway safety program.

Other Highway Safety Programs

The Hazard Elimination Program is authorized to require each state to conduct and maintain an engineering survey of all public roads to identify and to eliminate hazardous locations, sections and elements.

The rail-highway crossing program requires each state to conduct and systematically maintain a survey of all highways to identify public rail-highway crossings which may require separation, relocation or warning devices. The states must also establish and implement a schedule of projects to improve safety.

AUTHORIZATIONS

HIGHWAY SAFETY							
State & Community Grants							
NHTSA	$ 132[10]	$ 126	$ 126	$ 126	$ 126	$ 126	$ 630

Mr. MINETA. The Subcommittee on Surface Transportation will please come to order.

Today we are continuing a series of hearings relating to the reauthorization of the surface transportation issues of highways, bridges, and mass transit. Today we are going to be concentrating primarily on safety issues.

At this time I would like to call forward a very fine colleague from California, the Honorable George E. Brown.

Congressman Brown, we have your statement. It will be made a part of the record. Please go ahead and proceed in your own fashion, sir.

TESTIMONY OF HON. GEORGE E. BROWN, JR., A REPRESENTATIVE IN CONGRESS FROM CALIFORNIA

Mr. BROWN. Thank you, Mr. Mineta.

I appear before you with a great deal of humility this morning since I am not an expert in the issues which this subcommittee deals with and I know the great amount of work and effort that you and others on the subcommittee have made.

I come before you today because of a particular problem in my district that is within the purview of the subcommittee. I have been asked to take some appropriate action on, and I believe that the appropriate action is to support H.R. 3389, the Billboard Control Act.

As my statement indicates, we have a rather serious situation involving billboards on the major freeways which traverse my district. The number of billboards along the freeways is getting to the point where it is ridiculous.

What is happening at the present time, and what has aroused the very strong interest of local officials and local citizenry throughout my district, is the fact that the major freeways—the Route 10 Freeway, which goes from Los Angeles on out into the desert, and the Route 60 Highway, which goes from Los Angeles out to Riverside—are both historic routes lined with historic trees, as a matter of fact, some of which are 100 years old. We have a situation now where there is a battle developing between those who want to save those trees, and those who want to replace them with additional billboards.

We believe that a much more aggressive role is needed on the part of the Federal Highway Administration to enforce the provisions of the Highway Beautification Act along I-10 and I-60.

Of course, I don't want to be parochial. I suspect this same situation occurs throughout California and throughout the United States and we have to do something about this problem.

It is ridiculous to cut down beautiful, 100-year-old trees which line these freeways in order to put up more billboards. It is being argued that we want to cut down some of these trees in order to preserve the remainder of them. What they are planning on doing is selling the additional billboard space in order to finance an irrigation scheme for the remaining trees.

You know, this is just another step down the road to the removal of all our natural beauty on the freeways and replacing it with man-made features which are not beautiful, and which in many

cases are distractive, and reduce the safety of the highway. I urge the subcommittee to look with favor upon the proposed legislation by Congressman Lewis and others that would help to ameliorate this situation.

This is not a matter without serious political significance and importance. It has become a major issue in the communities throughout my district. The center of it is Fontana—probably the most rapidly-growing city in Southern California, which has grown from a sleepy little pig farm to a metropolis of nearly 100,000 people. It involves the communities of Rialto, Colton, Ontario, San Bernadino, and various other communities in that area.

So if I could, I ask for the sympathetic consideration of the members of the committee for this problem and constructive action on your part. I would be very grateful.

That concludes my statement, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Brown.

During the time of the meetings of the National League of Cities I did happen to have an opportunity to meet with a member of the city council from Fontana who also brought this very similar message. To me it doesn't make much sense to have the State of California putting in an irrigation system for eucalyptus trees and then having them turn right around and start trimming those trees down so they can make the billboards more visible.

Now, the existing provisions of the Highway Beautification Act require the payment of "just compensation" for the removal of non-conforming billboards along Federal aid interstate and primary highways. This bill would require the removal of all non-conforming billboards by 1995 without the payment of just compensation.

I am wondering, in that regard, do you support amortization as a means of compensation for owners of non-conforming billboards? Of course, amortization would be just a way of determining the remaining value of those boards and paying the owners of those boards.

Mr. BROWN. Mr. Chairman, we have a responsibility to be fair; however, fair is sometimes in the eye of the beholder. I don't believe in taking private property without proper compensation. The questions of the most appropriate way of evaluating the value of that property and how to provide the compensation are questions that I think the subcommittee ought to look at very closely. I think it is quite possible to work out non-cash means of compensating billboard owners for the removal of non-conforming billboards and these methods should be sought.

Mr. MINETA. Very well. Thank you very much, Mr. Brown, for your testimony and adding to our deliberations.

Let me ask Mr. Boehlert if he has any questions.

Mr. BOEHLERT. No questions. That was a usual fine statement from our colleague.

Mr. BROWN. Knowing the great wisdom of both of the gentlemen up there, I am sure that you will translate my remarks into something that will be extremely important. [Laughter.]

Mr. BOEHLERT. We'll do our best.

Mr. MINETA. We already have.

[Mr. Brown's prepared statement follows:]

STATEMENT OF
CONGRESSMAN GEORGE E. BROWN, JR.

before the
Public Works and Transportation Subcommittee
on Surface Transportation

March 22, 1990

Mr. Chairman, thank you for the opportunity to testify today on behalf of H.R. 3389, the Billboard Control Act.

The Highway Beautification Act of 1965 established a national policy and program for the control of outdoor advertising along federally funded interstate and primary highways. The Act was passed because Congress recognized the need to promote the safety of public travel, and to preserve natural beauty along our federal highways. Under this law, each state is required to develop and administer a sign-control program consistent with the national policy. As funding for the Federal Highway Administration declined, however, oversight of the state plans decreased dramatically. Furthermore, current compensation requirements have made it difficult to remove non-conforming billboards from the highways.

The General Accounting Office (GAO) conducted a study in 1985 which concluded that the goals of the Highway Beautification Act are not being realized. The GAO study recommends that Congress must reevaluate the current requirements governing billboards, and I believe that the Reauthorization of the Federal-Aid Highway Program gives us an excellent opportunity to look at how we can protect the integrity of our national highway system.

Let me illustrate the seriousness of the problem in Southern California. In the district which I represent there are 32 billboards located on a 1.2 mile stretch of the Interstate 60! A 14 mile segment of the Route 10 Freeway between Ontario and San Bernardino contains 82 billboards! An interesting irony is that several of these signs contain environmental messages. There are so many billboards that several are empty. Those that are used contain advertisments for items such as fast food, motels, hair spray, beer, gum, and telephone services. Residents of this area spend up to three and four hours a day commuting on these "decorated" freeways. Not only do the billboards pollute the sides of our freeways, but they also present a visual hazard which distracts drivers.

Since the state is responsible for regulating these billboards, I am shocked that the California state transportation agency recently proposed adding more billboards on I-10 in Fontana. Caltrans's proposal calls for laying six miles of irrigation along the freeway, ostensibly for the purpose of irrigating the eucalyptus trees which line the freeway. This

will be paid for primarily by erecting several new billboards--which will require removing 236 eucalyptus trees and trimming another 101 to improve billboard visibility. It is ridiculous to cut down these healthy trees in order to fund an irrigation system for them. These trees are at least 100 years old, and have served as a symbol for Fontana over the years. Several of the trees are dying, and the cities along the I-10 corridor agree that an irrigation system should be laid to preserve the healthy trees. What Fontana needs is a way to pay for irrigation; not a back-door attempt to install new billboards.

Mr. Chairman, I urge the Subcommittee to reevaluate the laws governing outdoor advertising along federally funded highways and interstates. The problems that I have discussed can be used to illustrate how the goals of the Highway Beautification Act of 1965 have yet to be realized. A remedy is clearly needed if we are to protect the public's investment in the federal highway system, and I believe that H.R. 3389 is a step in the right direction.

Mr. MINETA. Let me call forward our colleague, Congressman Jim Cooper of Tennessee.

TESTIMONY OF HON. JIM COOPER, A REPRESENTATIVE IN CONGRESS FROM TENNESSEE

Mr. COOPER. Thank you, Mr. Chairman.

I ask unanimous consent to put my statement in the record.

Mr. MINETA. Your full statement will appear in the record following your oral remarks.

Mr. COOPER. I would urge you to consider strongly encouraging the States to pass seatbelt legislation and helmet legislation for motorcycle riders. This is an issue which should be as close to us as motherhood and apple pie; yet, unfortunately, when we examine it more closely it turns out that Mom isn't so popular and many people have lost their taste for the apple pie.

As this committee is aware, traffic accidents exact a terrible death toll in this country of people of all ages, but they are the number one killer of Americans between ages 1 and 30.

According to the Department of Transportation, if we had had all of our highway passengers and motorcyclists buckle up and put on helmets we could have saved 15,000 lives in 1987, alone, and we could have saved $7 billion. Yet, today only a minority of Americans buckle up or put on a safety helmet, and many of those who do not claim that it is their privacy or that they don't want government intruding on them in their automobile or on that motorcycle.

There are three basic myths that the other side likes to put forward on this issue. First is the myth of traffic safety. The common American impression is that air crashes are the leading danger we face, and I think 389 Americans died in air crashes last year; 45,000 Americans died on the road. Yet, this myth persists that somehow getting in your car or riding a motorcycle is relatively safe.

The equivalent is this: our death toll on the highways is the same as if three jumbo jets crashed every week full of passengers with no survivors. Yet, the air crashes get headlines and our highway victims get tombstones.

There is another myth that is peddled. It is the myth of the ineffectiveness of the seatbelt or the helmet. First of all, unfortunately, for too many people it is too late for them to change their mind. They are already dead by the time they wish they could have used the safety restraint.

In an important Tennessee study conducted by the University of Tennessee they have found that victims are dead on arrival nine times more often when they are unbelted than when they were belted, and some 2,000 motorcyclists die each year just because they weren't wearing a safety helmet.

Another myth is the myth of government intrusion. The argument is that government has no business policing this sort of behavior. But, unfortunately, when the victim is in the hospital I feel they are imposing on the U.S. taxpayer when they ask us to pay their medical bills. Between one-third and two-thirds of medical costs for these victims are paid for by the U.S. taxpayer in one gov-

ernment health care program or another. It also increases our hospital bills and insurance rates.

There are studies that indicate that some three-quarters of motorcycle riders have no health insurance whatsoever. Completely unprotected, just ready to cast a health care burden on the U.S. taxpayer.

My proposal really is very simple. It is to buckle up and put on helmets. It should be, as I said earlier, as simple as motherhood and apple pie. Unfortunately it is not.

While 33 States do have seatbelt laws and 22 States do have helmet laws, we still have a long way to go both in getting the other States to conform and in terms of getting high usage rates in the States like my own, Tennessee, which have both laws but which don't have the usage rates that we would like to see.

My proposal is very simple, direct, cost-effective, cheap. All it does is save lives, prevent injury, and save taxpayer money. Yet there has been this traditional barrier there that has cost us an enormous carnage of our own citizens that has prevented us from taking proper action.

I would ask that we set aside $95 million—although this amount is, of course, negotiable in the wisdom of this committee—get that money from the Highway Trust Fund. Set it aside first to encourage the remaining States to pass conforming laws, and also encourage States which have laws to boost their usage rates. That would be the carrot.

The stick would be that after a period of time, if States had not passed these laws, then we would withhold a portion of their highway construction money. We would grant these States that were slow in protecting the lives of their own citizens a time period in which they could change their minds and recoup all the Highway Trust Fund construction money that they had lost.

My approach is to basically use the carrot and the stick to get American States to save the lives of their own citizens, to prevent injury, and to lower taxpayer expense.

I appreciate this distinguished committee listening to my remarks. I feel that unless we take action—long overdue action—all we are going to be doing is burying another generation of our young.

Thank you very much.

Mr. MINETA. Thank you very much, Congressman Cooper.

The approach you take of the withholding of highway funds, of course, is used in certain instances. But I am wondering, before we get to that point, do you think that as a first step before requiring mandatory motorcycle helmet laws that it might be productive to have, as you said, some kind of a concentrated public information and education campaign so that we might encourage motorcyclists to wear helmets? I take it that that's the primary use of what you are thinking about in terms of that $95 million authorization amount.

Mr. COOPER. Absolutely. I would much rather use the carrot than the stick. I would much rather have Americans on their own use the seatbelts that are already in their cars.

Mr. MINETA. And in your approach, how long would you have this campaign go on before the stick comes down?

Mr. COOPER. My time frame is designed to be quite flexible. I would like to get your guidance on this. I had thought a period of four years would be enough to give the public time to learn about safety advantages and to give state legislatures, particularly those that only meet every two years, time to implement legislation.

I don't wish to bring the dreaded hand of Federal Government down hard on anyone. My only goal is to try to educate people so that they know how to save their own lives.

Mr. MINETA. Now, Maryland is considering legislation to require insurance coverage similar to that required for operators of other types of motor vehicles. In your view, if such laws were adopted by States would that be a viable alternative to a mandatory helmet law?

Mr. COOPER. There are different approaches that could be used. If you are not wearing your helmet, though, even if you are fully insured, someone is going to have to pay a big cost. So while the Maryland solution seems to be an answer, it is only a partial answer in my view.

Mr. MINETA. You are absolutely correct about insurance coverage and the total cost and who bears that cost. There is no question that the public bears a very large percentage. I have forgotten what it was. I believe it was in excess of 60 percent that the public bears because most of those who are involved in motorcycle accidents don't have insurance of any kind and they generally then have also head injuries or other kinds of very serious injuries that require prolonged medical care. That has been borne by the public sector because of the lack of insurance.

Mr. COOPER. There is even a study in Seattle, Washington, which indicates that only 1 percent of the cost of health care is borne by the accident victim, himself or herself; two-thirds by the government, one-third or less by insurance companies, but the victim, himself, is only hooked for 1 percent of the cost.

Mr. MINETA. Congressman Boehlert?

Mr. BOEHLERT. I want to thank you for a very fine statement. I have been a strong proponent of seatbelt legislation. We have it in New York, and I think it works.

But, quite frankly, I haven't thought much about helmets for people riding motorcycles. Do you have any comparative figures that you might be able to provide us? You say 22 States do have the legislation on the books.

Mr. COOPER. There are several studies that indicate the helmet law, in particular, since it is so easy to enforce—it is much easier to tell whether someone is not wearing a helmet when they drive by a police car than it is whether they are wearing a lap belt, for example—that usage rates go way, way up once a helmet law is in place. You can get something like 95 percent compliance once a law is on the books. It is very visible and very easy to police.

Mr. BOEHLERT. Have you ever heard of a group called ABATE? Is that a national group or just a New York group?

Mr. COOPER. I think it is a national group.

Mr. BOEHLERT. I have had some people into my district office from this group and they are very responsible people, but they are strongly opposed to any helmet legislation. They make the argument that—I don't know if they can document—that in so many

cases where helmets have been worn there are more neck injuries than had they not had helmets. I don't know if that has any merit whatsoever.

Mr. COOPER. The doctors I have talked to refer to most motorcycles as "organ donor machines." They get disgusted every time a preventable injury was not prevented. Their profession is, of course, to save human lives.

Mr. BOEHLERT. Sure.

Mr. COOPER. It is my understanding that the overwhelming majority of doctors feel that it is a vital safeguard to protect your own head; otherwise, the risk of severe brain injury is overwhelming. Of course, the cost of life care for a brain-dead victim is astronomical.

Mr. BOEHLERT. I want to thank you very much for a very fine statement.

Mr. COOPER. Thank you.

Mr. MINETA. Congressman Cooper, thank you very much for being before us and adding your voice to this very important area.

Mr. COOPER. Thank you, Mr. Chairman.

[Mr. Cooper's prepared statement follows]

TESTIMONY OF CONGRESSMAN JIM COOPER

BEFORE THE SUBCOMMITTEE ON SURFACE TRANSPORTATION

MARCH 22, 1990

Mr. Chairman and Members of the Subcommittee, thank you for this opportunity to testify on the important matter of highway safety.

Traffic accidents are the number one killer of Americans ages 1 to 30, and Congress should reduce this threat.

I am here to ask you to include provisions, as you draft the highway reauthorization bill, which will strongly encourage every State to adopt seatbelt and helmet legislation.

According to the Department of Transportation (DOT), if we had all automobile passengers buckle up and all motorcyclists wear their helmets, 12,000 people would have been saved from death in 1987, and Americans would have saved $7 billion in costs of injury.

Today, only a minority of Americans wear their belts or helmets.

Too many politicians have let themselves be swayed by the few who complain that it is somehow "government intrusion" or that seatbelts and helmets are cumbersome.

These opponents of helmet and safety belt laws are trying to push three myths.

1. The Myth of Traffic Safety.

We hear people all the time who think airlines are more

dangerous, who think they're safer in their own car. They certainly don't complain when the airlines requiring them to buckle up during landings and takeoffs. And they're buying flight insurance policies by the thousands.

But airline crashes killed only 389 people last year. Vehicular crashes killed 45,000 last year in over 20 million major traffic accidents. That's like having three jumbo jets crash every week with no survivors. Would we do nothing if three jets crashed every week of the year?

And this does not even take into account the injuries. Motor-vehicle accidents leave 1.8 million people disabled each year, 150,000 of them permanently. They produce more paraplegics and quadraplegics than all other causes combined. And crashes are a major cause of epilepsy and cerebral palsy, as well.

2. The Myth of Ineffectiveness.

The opponents of mandatory use laws will try to cast doubt on how effective seatbelts and helmets are. They complain that they're uncomfortable and unnecessary.

But few ever complain about seatbelt or helmet laws after they or a loved one has been in an accident.

It's a grim statistic, but in Tennessee last year, unbelted automobile crash victims were found Dead-On-Arrival 9 times more often than belted victims. And almost 2000 motorcyclists die each year because they didn't wear their helmets.

Do you think any of these victims would have complained if they had worn their protection instead?

3. The Myth of Government Intrusion

The opponents of these laws will tell you that this is government intrusion into the privacy of their own cars and motorcycles. But when end up in the hospital because they don't wear their protection, they impose on us taxpayers to pay their medical bills.

Traffic accidents are not just deadly, they are also extremely costly. The cost of injuries to automobile and motorcycle riders sustained in 1985 was $40 billion total, according to a Johns Hopkins report to Congress. The study found that the average cost per fatal injury was $352,042, and for a hospitalized victim, $43,409.

The taxpaying public pays for these bills twice -- through our taxes and through our hospital bills and insurance premiums.

Estimates are that Government programs, especially Medicaid and Medicare, directly pay for one-third to two-thirds of all medical costs of traffic injuries.

On top of that, many uninsured victims who are not eligible for these programs simply do not pay their bills. Findings show that 75% of motorcyclists do not even have hospitalization insurance. Hospitals are then forced to pass their costs on to

the rest of us through higher charges. That means not only higher hospital costs but also higher insurance rates for us.

A startling study of injured motorcyclists admitted at a Seattle trauma center found that the victims paid less than 1 percent of their treatment costs, while the Government picked up the largest part of the tab. For each of the most severely injured victims, the public paid an average of $113,307 in medical costs.

Why should we pay these costs when a simple precaution on the part of the injured could have saved us this money?

Proposal: The Answer is Simple -- Buckle Up.

Many states have been wise enough to pass mandatory use laws. In these states, 20,000 lives and hundreds of millions of dollars have already been saved in the last 5 years. Seatbelt and helmet laws cost almost nothing. And they cut our traffic fatality rate sharply without new bureaucracies or unforeseen consequences.

Before the first state law passed in 1984, nationwide seat belt use rates were an abysmal 13 percent. With laws on the books in the majority of states, rates rose to a national average of 47 percent at the end of 1988. In states with helmet laws, over 98 percent of passengers and drivers wear helmets as compared to less than 50 percent elsewhere.

Clearly, mandatory use laws are effective, but they are not

widespread enough.

17 States still have no seatbelt law, and 28 States have no helmet law.

I strongly recommend incentives and, as a last resort, sanctions to encourage all States to adopt laws mandating seatbelt and motorcycle helmet use. This approach would provide safety program grants to States which adopt both laws, and additional grants for improving helmet and seatbelt use.

If incentives fail to bring a State to adopt both laws, I have recommended withholding highway construction funds. Congress has successfully employed this mechanism in the past on traffic safety issues, for example, such as drunk-driving and the 21 year old drinking age.

In conclusion, I believe that we should regard traffic safety as integral to our highway programs. I would ask that you take strong steps which improve prevention of fatality and injury from traffic accidents.

The suggestions I have put forward are cheap, simple and effective. The Federal Government has changed public attitudes for the better on many occasions. We must take the lead again on this matter of public safety. Otherwise, we will end up burying another generation of our young.

Mr. MINETA. Now I would like to call on our fine colleague from Kansas, Congressman Jim Slattery.

Mr. Slattery, we have your statement. It will be made a part of the record. Please proceed in your own fashion, sir.

TESTIMONY OF HON. JIM SLATTERY, A REPRESENTATIVE IN CONGRESS FROM KANSAS

Mr. SLATTERY. Thank you, Mr. Chairman. I appreciate the opportunity to appear before your committee.

Today I want to chat with you a little bit about several highway projects in Northeast Kansas. I realize that this committee has the unenviable task of trying to sort through all the requests of our colleagues and come up with a proposal that will enhance our nation's transportation system and do so in a fiscally responsible manner, and I certainly don't envy the challenge that you all have to face.

The State of Kansas and the people of Northeast Kansas in the last few years have made a major commitment to the improvement of our highway infrastructure. In fact, the State has recently launched the largest highway improvement program in the history of the State, and the State has committed some $600 million for system enhancements, as they are called, and local communities are being challenged to match the State money to make the kind of improvements in the local transportation system.

The State has received more than $1.7 billion in requests from local units of government for system enhancements in addition to the local matches that are pledged.

I have selected five projects in Northeast Kansas which I believe will significantly enhance safety and provide economic benefits to the community but are not likely to receive full funding from the State program simply because the money is not available at the State level.

Mr. Chairman, as the former mayor of San Jose I am sure you can appreciate the importance of some of these projects to local communities from the standpoint of economic development, and also from the standpoint of just improving our nation's highway system.

The State of Kansas and local governments are providing more than 48 percent of the cost of these projects. Let me just quickly run through a few of them and then I will be happy to answer your questions.

The Oakland Expressway, which is in northeast at Topeka, will restore economic viability and significantly reduce the travel time along the Wichita/Topeka/St. Joseph, Missouri diagonal corridor. I am requesting that you consider $21.25 million for this Oakland Expressway.

The West Leavenworth Trafficway will allow Leavenworth to continue to grow and reduce dangerous congestion in eastern Leavenworth and will primarily serve the Federal facilities located on the western side of the city. I will remind you that in Leavenworth, Kansas, is the Leavenworth Penitentiary, Fort Leavenworth, and the VA Hospital all located there. It is these Federal facilities that

have created the need for this trafficway and the major barrier to financing the construction because they are all tax exempt.

I am asking for $8.6 million to assist in the construction of the West Leavenworth Trafficway.

The safety problems associated with K-113 in Manhattan have long been recognized, but there has not been enough money to correct the situation. I am requesting $7.5 million for the system enhancements to K-113 which will create enhanced safety along this highway in the Manhattan area.

And then, in addition to that, there is another highway in the Manhattan/Fort Riley area, K-177. I am requesting $7.5 million to widen K-177.

The final project is the South Lawrence Trafficway which will provide improved interstate access to recreational facilities and the University Research Park while reducing congestion in the Lawrence area. I am requesting $20 million in demonstration funding to complete that South Lawrence Trafficway.

Again, Mr. Chairman, I know that you have a very difficult task and the sums that I am talking about here are large. I understand that, and I understand that the committee will have to make many adjustments in the requests. But I did want to get these requests on the table. As you are considering all the other requests from our colleagues, I would hope that you would give these requests fair consideration also.

I would be happy to answer any questions that you might have.

Mr. MINETA. Thank you very much, Mr. Slattery.

There are five projects here, are there not?

Mr. SLATTERY. That's correct.

Mr. MINETA. It is my understanding that the South Lawrence Trafficway does have some Federal funds right now?

Mr. SLATTERY. That is correct.

Mr. MINETA. And that one you say the total cost is going to be $62.8 million?

Mr. SLATTERY. That is correct. And currently——

Mr. MINETA. What is this $4 million of county bonds subject to litigation right now?

Mr. SLATTERY. Well, the local community is involved in helping to finance this, and there is a question right now as to some kind of required notice, I believe, that was supposed to be given that wasn't given, if I remember correctly, and that matter is being resolved in the courts right now. But there is general support in the community, both at the county level, the city level, and the State. They are all committed to helping construct this. Basically what we are talking about doing is building a bypass around the southern part of the city that will hook up I-70 with the highway that goes directly into Kansas City that will hook up with 435 and 635. So it is really improving the interstate highway system around the southern part of Lawrence. That is what I contend.

Mr. MINETA. Was the initial $7.2 million that was given to this project—now you are requesting an additional $20 million for that. Have costs gone up? What has changed since the Surface Transportation Assistance Act?

Mr. SLATTERY. Well, some costs have gone up. The fact of the matter is I just think this is part of the interstate highway system,

basically. Although it may technically not be, the fact that we are linking up with two U.S. highways is making that, in my judgment, a Federal project. That is the principal reason that I am asking for some additional assistance.

Mr. MINETA. You are very well aware because of your own active participation in the full budget issue——

Mr. SLATTERY. Absolutely.

Mr. MINETA. Given the kinds of budgetary constraints that are being imposed upon all of us—and especially on the highway trust fund—we may not be able to authorize the sufficient funds to address all of the needs that Members are bringing to us.

In this instance I am wondering if the State has considered other kinds of financing sources such as toll roads or a public/private joint venture of any kind?

Mr. SLATTERY. The State, as I indicated, has, in the last year, in fact, committed our State to a massive highway improvement project. In fact, over the next few years we are talking about somewhere in the neighborhood of $2 billion to $3 billion in highway improvements in the State of Kansas. That is the largest highway improvement program in the State's history. To finance that, they are talking about the sale of the largest quantity of bonds in our State's history, they are talking about increasing fuel taxes, and they are talking about increasing registration fees. So we have gone through the whole gamut at the local and the State level to come up with additional money.

So in terms of the total cost of what we are talking about doing in Kansas, it is a very, very tiny portion of the total commitment that we are talking about making to improving the infrastructure and highway system in the State of Kansas—very small part.

Mr. MINETA. And the Kansas gasoline tax is how much?

Mr. SLATTERY. I was afraid you were going to ask me that. I think it was just increased by another $0.07 a gallon.

Mr. MINETA. And is there a special provision for ethanol in Kansas as to whether or not they are paying their full share of the gasoline tax? Or is there some kind of a "break" at the State level for alternative energy?

Mr. SLATTERY. Let me answer you definitively and I will get back——

Mr. MINETA. One of the things I think we are going to be doing in the new 1991 highway authorization bill is to try to provide greater flexibility to State and local government in terms of the use of their surface transportation monies. To the extent that we are able to give that kind of greater flexibility in allowing States and localities to increase sources, do you believe that the project would be advanced to construction by the State of Kansas?

Mr. SLATTERY. I think that with Federal participation in these projects—and, again, I am not suggesting that the Federal Government should pay for all of it, and I do anticipate that with these projects that the local units of government will make a contribution ultimately and the State will make a contribution. But with the Federal contribution, what we are, in effect, able to do is raise the priority rating of some of these projects within the State to a point where they will move forward with the construction of them.

I am confident that with some Federal assistance on these projects they will be constructed, to make a long story short.

The Lawrence project is going to be constructed. It will probably break around some time in the next 18 months, hopefully.

Mr. MINETA. In the 1987 Act we required in these demonstration projects a 20 percent local match.

Mr. SLATTERY. Right.

Mr. MINETA. Do you think——

Mr. SLATTERY. I have no problem with that.

Mr. MINETA.—in this instance there would be any problem in trying to——

Mr. SLATTERY. No. I totally agree with that concept and I have no problem with that.

Mr. MINETA. Very well. Thank you very much, Mr. Slattery.

Mr. Boehlert?

Mr. BOEHLERT. No questions. Thank you very much.

Mr. SLATTERY. Thank you. Again, I appreciate the difficulty of the task that you have here.

Mr. MINETA. Congressman Skaggs?

Mr. SKAGGS. No questions.

Mr. SLATTERY. Thank you very much.

Mr. MINETA. Very good. Thank you very much.

[Mr. Slattery's prepared statement follows:]

Testimony of U.S. Representative Jim Slattery
Public Works Subcommittee on Surface Transportation
March 22, 1990

Mr. Chairman and Members of the Subcommittee, I would like to thank you for the opportunity to testify before the Public Works Subcommittee on Surface Transportation about five projects of great importance to Northeast Kansas. These five projects will enhance safety, encourage economic development, and enhance access to federal and state facilities.

THE OAKLAND EXPRESSWAY

I ask that the subcommittee recommend authorization of $21.25 million in contract authority for construction, engineering, administration, inspection, and right-of-way acquisition for the Oakland Expressway in Topeka, Kansas, as a demonstration project in the 1991 highway authorization bill. The total cost of the project is estimated to be $42.5 million.

The Oakland Expressway, located in Eastern Topeka, will provide regional north-south traffic, currently traveling through downtown Topeka on U.S. 75 (Topeka Boulevard) and Kansas Avenue, with a more direct, cost effective route. The new bypass will enhance safety by relieving traffic congestion and also will improve safety associated with the truck traffic through downtown Topeka. An additional benefit will be enhanced economic development in Eastern Topeka.

The project will provide a direct connection from U.S. 24 and Kansas 4 to U.S. 40, Interstate 70, Interstate 470 and the Kansas Turnpike. The project is approximately 5.5 miles in length. The southern terminus of the project is at Interstate 70 just north of the East Topeka Turnpike Toll Plaza. The northern terminus is at U.S. 24/Kansas 4.

The Oakland Expressway will provide a 4 lane controlled access connection between I-70 and U.S. 40, with interchanges at I-70, Croco Road and U.S. 40, and a 2 lane facility from U.S. 40 to U.S. 24/K-4. The project will include right-of-way and protection of the corridor for future expansion to a 4 lane divided freeway from I-70 to U.S. 24/K-4. Preliminary plans were prepared and right-of-way purchased for the section between I-70 and U.S. 40 in the early 1960's. The availability of right-of-way varies from 250' to 315' along this section, with additional right-of-way along interchange locations. Additional right-of-way may be required along this section to meet current design standards and right-of-way will be required for the remaining section between U.S. 40 and U.S. 24/K-4.

Testimony of U.S. Representative Jim Slattery
Public Works Subcommittee on Surface Transportation
March 22, 1990

The economic development of the Oakland area has been stifled due to the lack of adequate roadway facilities. The area has a number of manufacturing and freight distribution firms. Those firms contacted indicated that their economic viability is constrained by the lack of direct connections to highways. Present circuitous routing results in much lost time for shipping, transport, and commuting.

The Oakland area has a declining population and employment share. There are presently 3,425 jobs in the impact area. Without the highway improvement, a continuing decline will occur. With the construction of the Oakland Expressway, the decline will be reversed, creating approximately 1,500 new jobs. There is a sufficient labor pool to provide the new employees. In addition, the City of Topeka has identified $2,505,736 for the Oakland area as part of its Capital Improvement Plan.

The Oakland Expressway also will have a regional impact beyond the Oakland area. The diagonal corridor created by the Kansas Turnpike from Wichita to Topeka, and continuing from Topeka via K-4 and U.S. 59 to Atchison and St. Joseph, Missouri, also will be served by the Oakland Expressway. The Oakland Expressway will reduce travel time by more than 30 minutes for the diagonal corridor.

The City of Topeka has prepared a report on the safety aspects and a report on the economic aspects of the Oakland Expressway project. I ask permission to include text from these reports, along with letters of endorsement from community leaders, in the record.

THE WEST LEAVENWORTH TRAFFICWAY

In addition, I ask that the subcommittee recommend authorization of $8.6 million in contract authority for construction, engineering, administration, inspection, and right-of-way acquisition for the West Leavenworth Trafficway, in Leavenworth, Kansas, as a demonstration project in the 1991 highway authorization bill. The City of Leavenworth has had a longstanding need for a north-south arterial on the western side of the community. The West Leavenworth Trafficway is a 3.1 mile section of 4 lane roadway that starts on Eisenhower Road and continues north to Spruce Street, where it will connect with the existing 20th Street, providing a north-south route between Eisenhower Road and U.S. 73.

Testimony of U.S. Representative Jim Slattery
Public Works Subcommittee on Surface Transportation
March 22, 1990

The West Leavenworth Trafficway will provide a western point of access to the U.S. Penitentiary and Fort Leavenworth. This will relieve congestion on 4th Street (U.S. 73), 10th Street, and Spruce Street in Leavenworth, greatly enhancing safety. In 1980, 4th Street was nearing capacity, and in 1989 a traffic count conducted by the Kansas Department of Transportation found one location where the count already exceeded 20,000 vehicles per day. Projections for the year 2010 show all three routes exceeding capacity, if the trafficway is not built.

Congestion on 4th Street is compounded by adjacent elementary and junior high schools and the narrowing of 4th Street in the central business district. More than 400 students a day, both elementary and junior high, must cross 4th Street in order to attend school. The West Leavenworth Trafficway will reduce this congestion, as well as providing room for growth.

The West Leavenworth Trafficway will facilitate the growth of Leavenworth to the west. The new Leavenworth Business Center, an 80 acre industrial park located on Eisenhower Road, will be served by the facility. Leavenworth is expected to experience population growth of over 50% through the year 2020, the bulk of this growth occurring to the west. In addition, the U.S. Penitentiary is planning a major expansion in the 1990's.

The City of Leavenworth has always had a good and mutually beneficial relationship with its federal neighbors, the U.S.P. and Fort Leavenworth. Leavenworth welcomes the addition to the U.S.P. and is hopeful that the U.S. Marshals Service will locate its new detention center in Leavenworth. With the trafficway, the City of Leavenworth will be able to continue to grow and will be able to meet the needs of its federal neighbors.

I ask unanimous consent to submit a concept study prepared by the City of Leavenworth, Kansas, together with safety information and letters of endorsement from public officials, for inclusion in the record.

THE KANSAS HIGHWAY 113 ENHANCEMENT

I also ask that the subcommittee recommend authorization of $7.5 million in contract authority for construction, engineering, administration, inspection, and right-of-way acquisition for enhancements to Kansas Highway 113 (Seth Child Road, K-113) in Manhattan as a demonstration project in the 1991 highway authorization bill. The total cost of the project is estimated to be $13.337 million.

Testimony of U.S. Representative Jim Slattery
Public Works Subcommittee on Surface Transportation
March 22, 1990

K-113 is the primary arterial servicing Fort Riley, Kansas State University, and western Manhattan and is extremely congested with a very high accident rate. The current traffic volume approaches 20,000 vehicles per day, with peaks at 7:00 a.m. and 5:00 p.m. The Kansas Department of Transportation estimates that within twenty years K-113 will be operating at 129 percent of capacity.

In addition, Manhattan will benefit economically from the enhancements to K-113. Large tracts of land adjacent to K-113 remain undeveloped and underdeveloped because of the transportation concerns associated with K-133. Improving access to western Manhattan will encourage development of this land and planned expansion of Kansas State University. Fort Riley also is considering a site expansion, as part of its Land Use Requirements Study.

I ask unanimous consent to submit a copy of materials, prepared by the City of Manhattan, Kansas, to demonstrate the need for the enhancements to K-113, for inclusion in the record.

THE KANSAS HIGHWAY 177 ENHANCEMENT

I also ask that the subcommittee recommend authorization of $7.5 million in contract authority for construction, engineering, administration, inspection, and right-of-way acquisition for enhancements to Kansas Highway 177 (K-177) beginning at the intersection of K-177 and Interstate 70 (I-70) and continuing to Manhattan, Kansas, as a demonstration project in the 1991 highway authorization bill. This project will provide Manhattan with direct four lane access to I-70, providing economic benefits as well as improving safety. The total estimated cost of the project is $20.196 million.

The enhancements to K-177 will provide better access to Kansas State University, Fort Riley, and the Job Corps Center located in Manhattan, as well as encouraging new businesses to locate in Manhattan. A study conducted for the City of Manhattan estimates that the project would result in the creation of 600 to 1200 additional jobs and $12-$24 million in additional income.

I ask unanimous consent to include materials prepared by and for the City of Manhattan, Kansas, which describe the economic and safety benefits of expanding K-177, in the record.

Testimony of U.S. Representative Jim Slattery
Public Works Subcommittee on Surface Transportation
March 22, 1990

THE SOUTH LAWRENCE TRAFFICWAY

Finally, I am requesting additional assistance for the South Lawrence Trafficway Project, which received $7.2 million in demonstration project assistance in the Surface Transportation and Uniform Relocation Assistance Act of 1987 [Section 149(a)(72)].

This highway project, in Douglas County, Kansas, will demonstrate methods of reducing traffic congestion and facilitating the usage by motorists on the Interstate system of recreational facilities by construction of a limited access trafficway of approximately 14 miles in length which at its western terminus will provide access from an east-west interstate route to a reservoir and a university research park, proceeds easterly around the southern portion of the City of Lawrence, and at its eastern terminus will provide access to a business park and a limited access east-west highway. When completed, the Trafficway will be a four-lane road with the lanes separated by a 44-foot grass median. Paved shoulders will be built on both sides.

Traffic patterns in and around Lawrence and Douglas County have undergone significant changes over the past 10 to 15 years. The major factors causing these changes include: growth of Johnson County (suburban Kansas City, to the east of Douglas County); completion of the Clinton Reservoir, in southwestern Douglas County; the emergence of Lawrence as a central location for families with one or more persons working in Topeka (to the west) or Kansas City; the growth of western Lawrence; and an increase of approximately 500 students annually during recent years at the University of Kansas in Lawrence.

The total cost of the Trafficway project is estimated to be $62,860,100. Thus far, the federal government, the City of Lawrence, and Douglas County have committed over $17 million for the Trafficway project (although the $4 million of County bonds are the subject of pending litigation before the Kansas Supreme Court) and the Kansas Turnpike Authority has committed approximately $2 million for an interchange linking the Trafficway with Interstate 70. The Final Environmental Impact Statement for this project recently was approved. I have attached a copy of descriptive materials on the South Lawrence Trafficway prepared by the City of Lawrence and Douglas County for the Committee's review and ask permission to include it in

the record. I am requesting an additional $20 million in demonstration project funding for the South Lawrence Trafficway Project.

Thank you again for the opportunity to testify before the committee.

Mr. MINETA. At this time let me call forward the Commissioner of the Minnesota Department of Transportation, Leonard W. Levine; and Ernest L. Olson, County Highway Engineer, Douglas County, Minnesota, and the current Secretary-Treasurer of the National Association of County Engineers, representing the Minnesota Transportation Alliance.

First, let me recognize my fine colleague from New York, Mr. Boehlert.

Mr. BOEHLERT. Mr. Chairman, our senior colleague, Mr. Stangeland, had hoped to be here but he is unavoidably detained with a conflict. He personally wanted to welcome both Mr. Levine and Mr. Olson here. He has worked so well with you over the years and he speaks very highly of you. That is a good recommendation.

Mr. MINETA. It is a pleasure to have you here with us today. Mr. Levine, please proceed in your own fashion, sir.

TESTIMONY OF LEONARD W. LEVINE, COMMISSIONER, MINNESOTA DEPARTMENT OF TRANSPORTATION

Mr. LEVINE. Thank you very much, Mr. Chairman.

My name is Leonard W. Levine. I am Commissioner of the Minnesota Department of Transportation.

Thank you for giving me the opportunity to appear before your subcommittee today. I am certainly very pleased and honored to be here.

Transportation safety is one of the most critical issues that face State transportation officials, and it is a very important matter to the millions of transportation users that we serve. Today I would like to briefly outline Minnesota's efforts to improve transportation safety.

I would like to point out to you that I have no intention today to ask for any additional dollars but to point out to you that we have——

Mr. MINETA. Then you are welcome to stay all day. [Laughter.]

Mr. LEVINE. I would just like to indicate we have placed safety as our highest priority and we have utilized existing dollars to accomplish what we have set out to do.

During the last three years we have had the lowest traffic fatality rate in the United States. Even though Minnesota is the best in the nation in terms of fatalities, both the statistics and our citizens tell us that we need to do more to improve the safety of our highways and railroad crossings.

Our goal in Minnesota is to cut the highway death rate in half by the year 2000, and that would bring down our fatality rate to .75 per 100 million vehicle miles travelled.

Last fall Minnesota's governor, Rudy Perpich, and I attended 14 transportation safety forums held around the State of Minnesota. These forums were coordinated and promoted by local citizens groups. Approximately 2,000 people attended and more than 700 citizens gave oral or written testimony. This citizen input has helped us identify some of our major transportation safety problems.

Based on this testimony, we formulated Minnesota's transportation safety enhancement plan. Included is $7.6 million to address

low-cost highway safety improvements during the next two years. The forums also identified another 233 State highway safety needs. To meet these needs will require about $500 million more from the State legislature beginning in 1991. We have a Transportation Study Board looking at our needs at the present time.

The forums identified railroad grade crossing as a significant transportation safety hazard. The Department of Transportation in Minnesota has established a Minnesota grade crossing safety program and designated a program management team.

Survey forms and instructions are being developed to conduct field reviews for the purpose of recommending specific signs and markings on 684 public railroad highway crossings this year.

Last November Minnesota also instituted an intensified truck safety plan which includes a State-wide truck air surveillance program and periodic saturation of truck inspections.

At the present time we are establishing truck inspection agreements with the Departments of Transportation in our neighboring States of North and South Dakota and Wisconsin and Iowa. Our goal is to double the number of truck inspections during this year.

We have also initiated a truck safety hotline for citizens to report suspected truck safety violations.

My written testimony contains additional information on our approach to highway work zone safety, an issue which is becoming even more important as more of our highways require extensive repair and reconstruction.

Finally, I want to emphasize the importance of the Federal-State-local partnership in transportation safety. We get $9 million for safety projects from the Federal Government, and we leverage those funds with the State of Minnesota's dollars for over $15 million for safety improvements. A continuation of this very fruitful partnership in transportation safety is essential to continued safety improvement during the 1990s and beyond.

AASHTO has given its full support to a continued strong Federal role in highway and transportation safety. AASHTO's recommendation is that the safety of Americans should be preserved and enhanced through the continued national commitment to safety research, safety applications, and safety projects. I will heartily concur on these recommendations.

Chairman Mineta, thank you very much for the opportunity to present the views of the Minnesota Department of Transportation on this most important issue. I have a document that I would like to pass out to you. It explains our program. It has been referred to as a model in the United States, and we are happy to share it with the rest of the transportation community.

We would be pleased to respond to any questions.

Mr. MINETA. Thank you very much, Mr. Levine.

Let me go ahead and have Mr. Olson make his presentation at this time.

Mr. Olson, it is a pleasure to have you here. Please go ahead and proceed in your own fashion, sir.

TESTIMONY OF ERNEST L. OLSON, COUNTY HIGHWAY ENGINEER, DOUGLAS COUNTY, MN, CURRENT SECRETARY-TREASURER, NATIONAL ASSOCIATION OF COUNTY ENGINEERS, REPRESENTING MINNESOTA TRANSPORTATION ALLIANCE

Mr. OLSON. Thank you, Mr. Chairman.

I am Ernest Olson, a county highway engineer from West Central Minnesota and, as stated, a member of the Minnesota Transportation Alliance, which was formerly known as Minnesota Good Roads, Inc. I again thank you for the opportunity to appear before this subcommittee.

County government is an active participant in the Minnesota Department of Transportation effort to maintain and improve Minnesota's success in the area of highway safety. Local highway safety improvement programs have been funded with a combination of local, State, and, to a greater extent, Federal safety funds. The success of these programs is the direct result of the favorable local/State/Federal working relationship we have in Minnesota. Examples of our accomplishments may help to emphasize the real need for continued Federal financial participation. My examples will be one of a local nature and two of State-wide nature.

With Federal safety funds, Douglas County, Minnesota, has been able to install automatic signalized railroad highway crossing protection at two locations, with a third crossing scheduled for this spring. Seven additional grade crossings have been identified as critical locations needing improved protection.

The hazards of unprotected railroad grade crossings were mentioned repeatedly at the series of public transportation safety forums recently held throughout the State of Minnesota. It is a tragic reality because of funding constraints that crossing improvement priorities are driven by accident-fatality rates.

The second example: in the early 1980s the Minnesota Department of Transportation—MNDOT—spent nearly $5 million of Federal aid off-system safety funds to improve regulatory and warning signs on the road systems of Minnesota's 87 counties and also in cities having a population of 5,000 or more. This signing project generated a lot of interest in upgrading township signing.

Early in 1986, MNDOT developed a local government off-system or township signing program to help correct regulatory and warning sign deficiencies. The purpose of this safety program is to make Federal safety funds available to local road authorities to bring regulatory and warning signing on local roads and streets into compliance with the Manual on Uniform Traffic Control Devices.

A single project is developed for each county under the administration of the county engineer. In 1987, governor Perpich accepted a national safety award from the Federal Highway Administration in recognition of Minnesota's efforts to improve signing. To date, 70 of the 87 counties in Minnesota are participating, with a total of $10.2 million in Federal safety funds allocated for this program.

Minnesota's bridge replacement program is another example of the accomplishments which can be achieved with a local/State/Federal partnership. Fortunately, Minnesota has had a bridge inventory system in place since 1967, and we were ready when special Federal bridge replacement funds became available in 1975.

Since that time, Federal funds in excess of $111 million have been a major factor in replacing some 4,000-plus deficient structures on the county and local road systems. Unfortunately, Minnesota still has more than 4,000 structures on the county and local road systems which are considered deficient by Federal criteria. There are several emerging issues which will significantly impact and most likely add to the cost of Minnesota's bridge needs on all systems in the next 20 years. These issues include truck weight increases, revised rating standards, ability of local units of government to meet growing bridge replacement needs, and decreasing availability of Federal discretionary bridge replacement dollars.

We urge the members of this subcommittee and your colleagues in Congress to keep the transportation needs of local government in mind as you consider new Federal transportation legislation.

It has been said with substantial documentation that America runs on local roads. Federal aid secondary funds, Federal aid bridge replacement funds, and Federal aid safety funds have been a vital part of local road improvements in the past. Given our aging infrastructure, increasing traffic volumes on all highway systems, and increasing truck weights, it is absolutely critical that adequate Federal funds be provided to preserve the tried and proven local/State/Federal transportation partnership.

In closing, Mr. Chairman, I wish to call your attention to an attachment to the written copies of my remarks which have been provided to this subcommittee. This attachment states the position of the National Association of County Engineers—NACE—on the future of the Federal surface transportation program. This position paper expresses the concerns and suggestions of NACE for the role of the Federal Government regarding local transportation issues in the so-called post-interstate era.

I feel honored for the privilege to appear before this subcommittee and thank you for your attention and consideration. I would be pleased to respond if there are any questions.

Mr. MINETA. Thank you very much, Mr. Olson.

From your testimony, Mr. Levine, it is apparent that Minnesota has a very fine highway safety program and that you have, indeed, made it a priority. What safety programs would you say have produced the greatest safety benefits in Minnesota?

Mr. LEVINE. Well, there are a number of things, as I indicated. Roadway improvements, brighter pavement markings, improved site distances——

Mr. MINETA. Let me ask on pavement markings: have you increased the width of those or the frequency of signs because of maybe an aging population in Minnesota? Have you done something special with regard to aging drivers?

Mr. LEVINE. Yes. For aging drivers we have increased the letters on signs, improved the reflectivity of the signs, better lighting at the intersections because of the loss of the sight for the aging driver.

Mr. MINETA. What about this issue of grade crossings? I take it that is a big problem for you in Minnesota?

Mr. LEVINE. Yes, Mr. Chairman, it is a big problem. We have about 5,000 rail crossings, and only 1,000 of them are signalized. Before I left, in fact, the day before I came out to Washington I

reviewed a preview film that we have made of a test that we are soon to announce. We haven't announced it yet even to the public. We have put new markings with a very high-grade intensity reflectivity on crosswalks and the signs pushing the rail crossings.

Mr. MINETA. Are they buttons or are the——

Mr. LEVINE. No. They will just reflect the lights on a dark road. It is unbelievable when you see it in the film. Without it you come down the road and you can't see a train. Trains go by—I am from the metropolitan area and I never realized that out in rural areas when a train goes by you can't see it. The governor and I visited——

Mr. MINETA. I'm sorry? The train is on the track and you don't——

Mr. LEVINE. The train is on the track going at night, and the car is coming down the road. At a distance where the lights aren't hitting the train, a car is coming down the road and it is virtually impossible in a dark area to see a train going by.

Mr. MINETA. That marking is on the road, itself?

Mr. LEVINE. Those markings will be on the road. This is a test now. We hope to have almost 1,000 of these underway beginning in the summer as soon as the roads are warm enough that we can do this work.

Mr. MINETA. And what happens in the wintertime when you have got three feet of snow?

Mr. LEVINE. Well, we don't allow the three feet of snow to build up.

Mr. MINETA. Even in the rural areas?

Mr. LEVINE. Yes. And——

Mr. MINETA. I wish there were some mayors around who took heed of that. [Laughter.]

Mr. LEVINE. Sometimes it comes as a surprise to people from other parts of the country, but our interstate system has never closed during the worse snowstorms.

Mr. MINETA. But I take it a lot of these are just county roads or rural roads where you have a railroad crossing. Is this kind of striping being done on those roads, as well, or are you just doing this on Federal aid to primary system?

Mr. LEVINE. It is going to be on all roads. I started to say—and I guess I got diverted here—in addition to the markings being on the road, we also realize that as the train goes by the spacings between the train you can't see anything on the other side. What we have done is reflectorize the back of the sign on the other side, and it is dramatic. As the car is approaching it is like a strobe light shooting bright light as the train goes through. I am convinced that we will save lives and it will be a dramatic improvement in rail crossing.

Mr. MINETA. Is this a new product, or is this——

Mr. LEVINE. The product that we are using is on the market now. It is an emerging product. A Minnesota company, 3M, has it. But there are other companies around the world that also are producing this product.

Mr. MINETA. I say maybe something similar to that. I was just recently at the American Traffic Safety Services Association meeting and saw something called Seebulite. I don't know whether——

Mr. LEVINE. Mr. Chairman, it is the same thing. The 3M product is called Diamond Grade, and it is——

Mr. MINETA. Right. Diamond Grade. I remember that now.

Mr. LEVINE. When you see it—if you don't mind, I'll send you the tape that we have made of before and after and you will see the dramatic improvement that this makes.

Mr. MINETA. That sounds great.

Now, do you think that highway safety standards and regulations should be retained primarily at the Federal level?

Mr. LEVINE. Yes, Mr. Chairman. It should be maintained at the Federal level, but we should also maintain it for consistency throughout the State level, as well.

Mr. MINETA. Now, if you were given the responsibility of drafting a new Federal aid program, how would you balance safety with mobility and productivity?

Mr. LEVINE. Mr. Chairman, safety must be the highest priority. It has been our opinion in Minnesota that you can't have mobility in a free flow of ccmmerce and industry unless you have a safe road system. That is why we think that both are compatible and that you can't have one without the other. But safety as a priority—and, as I indicated, many of the things that we are doing allows for the free flow of traffic.

When there is a traffic incident that occurs on one of our freeways, for example, on one of the major roads in Minnesota, it ties up traffic and disrupts the flow for business.

Mr. MINETA. Mr. Olson, thank you very much for your fine statement.

How does Minnesota's design and performance standards compare to those of the Federal Highway Administration? Do they tend to be more stringent than Federal highway criteria or about the same?

Mr. OLSON. Well, first of all, when it comes to safety, particularly in highway signing, we try to comply with the Uniform Manual on Traffic Control Devices, which is a national criteria.

Mr. MINETA. Do you feel that UMTCD is pretty good?

Mr. OLSON. Yes. And I think it is important, too, that except for the interstate system, which everyone recognizes, I think the traveling public is aware of what system of highways it is on. I think it is as important to have safety features on our county system as it is on other State systems for the safety of the traveling public.

Mr. MINETA. Now, since authorization of the rail highway crossings program under section 203 of the Highway Safety Act of 1973, there has been a reduction of 89 percent in fatal accidents and a reduction of 63 percent in non-fatal injury accidents. Given this record, do you think there is a continuing need for Federal funding for rail highway crossing safety projects?

Mr. OLSON. Yes, I would certainly say that there is that continuing need. Even with the statistics of the reduction in accidents, we have a lot of crossings out there yet that continue to be identified as hazards. I think that certainly that program needs to be continued.

Mr. MINETA. In your statement you speak of the bridge replacement program as another example of the accomplishments which can be achieved with a local/State/Federal partnership. I am won-

dering if the State of Minnesota would be able to continue to fund these approximately 4,000 deficient road and bridge projects if there were a reduced Federally-funded bridge program. If that were to occur, what would be the funding source for a bridge program?

Mr. OLSON. I think Minnesota first of all has an extensive bridge replacement program, Mr. Chairman. Certainly the Federal funds have been a major factor in that program. On the other hand, the State of Minnesota, along with Federal funds, has provided special bridge replacement funds through a bridge bonding program—special funds in addition to our regular highway user funds. So I would expect that even without Federal funds bridge replacement projects would continue at Minnesota—at obviously a reduced rate, however.

Mr. MINETA. Mr. Levine, do you have any reaction on that score?

Mr. LEVINE. Mr. Chairman, Mr. Olson is correct. The only thing I might add is that with the continued Federal role—and I think this was asked earlier of me—there is a consistency across the country because we do drive in other States and our responsibility really shouldn't end at our border. So it maintains the consistency. All States are going through similar problems that we are in aging and deteriorating infrastructure.

Mr. MINETA. Mr. Olson, what about current highway safety construction allocations? Are those adequate?

Mr. OLSON. Probably those of us in the highway industry feel that funding is never adequate, but I think, more importantly, we need to at least make our needs known so that those funds are continued as you consider new transportation legislation.

Mr. MINETA. Do you think a percentage of 3R and 4R funds should be dedicated to highway safety 3R and 4R projects?

Mr. OLSON. Yes. I would agree with that.

Mr. MINETA. Thank you very much.

Mr. Clinger?

Mr. CLINGER. Thank you, Mr. Chairman, and thank you, gentlemen, for your testimony.

I am just following up on that. In other words, you are saying that you think that the Federal funds that are presently available for highway safety are inadequate and that we should supplement those by providing for additional funds out of the 3R and 4R program?

Mr. OLSON. I am sure that with additional funds that we could do additional things to make our highways safer. I realize the funding constraints that all of us face on all levels, but I think it is important. Certainly highway safety is our critical issue, and I think we need to keep that in the forefront.

Mr. CLINGER. So we should, in looking at the reauthorization, give increased attention to the safety elements?

Mr. OLSON. I would urge you to consider that. Yes.

Mr. CLINGER. You talked about three programs—secondary, bridge, and safety. Which, in your opinion, has the greatest overall impact on safety? Which has the highest priority, in your view? Or are they all basically the same in terms of impact they would have on safety?

Mr. OLSON. I think they all tie together.

Mr. CLINGER. All tie together.

Mr. OLSON. I really do.

Mr. CLINGER. Not one over the other?

Mr. OLSON. That's correct.

Mr. CLINGER. Mr. Levine, you have talked about your emphasis in Minnesota on violations involving truck safety and driver safety and we certainly applaud that emphasis and priority you are giving that. Do you think that the commercial driver license law, which we passed here in 1986, would aid you in this effort? Where does the State of Minnesota stand in terms of its implementation of that law? Could you tell us that?

Mr. LEVINE. Mr. Chairman and Mr. Clinger, the answer is yes. We are implementing that.

As a follow-up comment, you complimented Minnesota. I would like to indicate for the record that Minnesota has placed historically a high level of support to invest in the infrastructure. Our spending—and I wanted to get this on the record—our spending for public road programs is about one and a half times the national average. Our government provides a larger share. We provide 90 percent State and local dollars compared to a national average of 78 percent State and local in the highway program.

Recently there was a scientific poll taken which indicated that 78 percent of Minnesotans would favor increased taxes to go specifically for continued road improvements.

So we have a good environment and climate in Minnesota.

Mr. CLINGER. What is your State gas tax?

Mr. LEVINE. Our gasoline tax is $0.20.

Mr. CLINGER. It's $0.20, and you are saying that the surveys indicated that people would accept an increase in that?

Mr. LEVINE. Yes. People would accept an increase because it is a dedicated, Constitutionally-protected fund which would go specifically for road improvements.

Mr. CLINGER. And it does get spent for that purpose, I take it?

Mr. LEVINE. Yes, it does.

Mr. CLINGER. We have a little problem here with that.

Mr. LEVINE. I am aware of that. [Laughter.]

Mr. CLINGER. You are requesting $500 million from your State legislature, as I understand it, specifically targeted toward safety improvements; is that correct?

Mr. LEVINE. Yes. We have a Highway Study Commission consisting of legislators and others who have been reviewing all of the needs this past year. They will report next year for the beginning of the new biennium in Minnesota's legislature, and I am confident that they will recommend a significant program for funding for road improvements.

Mr. CLINGER. And you feel that you are not going to have too much difficulty selling that or getting that authorization?

Mr. LEVINE. Well, three years ago we were looking to stabilize and get a predictable source of funding, and then, with a significant effort among the community—Democrats and Republicans, strong support from Governor Perpich—it took about 17 months and the legislature came through with the largest transportation package in the history of Minnesota, followed in the next year with another significant funding program. And then this year within

our existing budget we have allocated almost $4 million for safety programs. We are really trying to get caught up. We have had a high amount of Federal discretionary dollars. We think next year will be another follow-up year to what has become a regular part of the funding entitlement.

We believe that transportation should be considered an entitlement because it drives the whole economy.

Mr. CLINGER. I certainly commend you. Nobody could say that Minnesota isn't doing its share to address the infrastructure problems and highways, and I think you are doing an outstanding job. I certainly congratulate you.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Applegate?

Mr. APPLEGATE. No questions.

Mr. MINETA. Let me call on a very fine colleague who is the ranking Republican on the full Committee on Public Works and Transportation, Congressman Hammerschmidt of Arkansas.

Mr. HAMMERSCHMIDT. Thank you, Mr. Chairman. I have no questions.

Mr. MINETA. Mr. McEwen?

Mr. MCEWEN. No thank you, Mr. Chairman.

Mr. MINETA. Mr. Packard?

Mr. PACKARD. None.

Mr. MINETA. Well, Mr. Levine and Mr. Olson, thank you very, very much for your presentation here. You have a very admirable record there in Minnesota and you have a lot to learn, I think, from your own experience. Thank you very much.

Mr. LEVINE. Thank you.

Mr. OLSON. Thank you very much.

[Mr. Levine's prepared statement appears on page 1426.]

[Mr. Olson's prepared statement appears on page 1440.]

Mr. MINETA. I would now like to call on a very distinguished Governor and a good friend of many of us, the Honorable Richard F. Celeste, the Governor of the State of Ohio. He is being accompanied by our very fine colleague who testified before us last week and a very powerful member of the Appropriations Committee. Let me introduce and have come forward as well the Honorable Congressman Lew Stokes.

TESTIMONY OF HON. RICHARD F. CELESTE, GOVERNOR, STATE OF OHIO, ACCOMPANIED BY HON. LOUIS STOKES, A REPRESENTATIVE IN CONGRESS FROM OHIO

Mr. STOKES. Thank you very much, Mr. Chairman.

Mr. Chairman and members of the committee, it is a pleasure to once again be before this committee.

As you will recall, I appeared before your committee on March 13th, along with other members of the Ohio delegation. We shared with you our concerns about the way that surface transportation projects are funded. We offered suggestions that we hope this committee will consider in the deliberations on the reauthorization of the Surface Transportation Act.

Today the Governor of the State of Ohio, Richard Celeste, will speak on this subject from his perspective as Governor of a donor State.

We hear a lot about the need for States to pick up a greater share of spending in transportation. In my State we are already doing this. We consider it, under our Governor, to be a good investment because we recognize and the Governor recognizes the relationship between a strong transportation system and economic development.

Governor Celeste has made the invigoration of our State's transportation system one of his central priorities. Since 1983, Mr. Chairman, Ohio has invested more than $6.5 billion in highway contracts. Last week the Governor announced 44 new projects in 88 of our counties.

Under Governor Celeste's leadership our State has made a commitment to developing a transportation system that will be a source of pride to all Ohioans. It is, indeed, an honor for me to appear here with him this morning and present to you our distinguished Governor, Governor Dick Celeste.

Mr. MINETA. Governor Celeste, before you proceed, if I might let me put into the record a statement from our colleague, Congressman Feighan, who was not able to be here but wished to have been here. I will go ahead and make this part of the record at this time.

[Mr. Feighan's prepared statement follows:]

TESTIMONY
OF
EDWARD F. FEIGHAN
MEMBER OF CONGRESS

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
SUBCOMMITTEE ON SURFACE TRANSPORTATION
NORMAN Y. MINETA, CHAIRMAN

REAUTHORIZATION OF THE POST-INTERSTATE
SURFACE TRANSPORTATION PROGRAMS

MARCH 22, 1990

CHAIRMAN MINETA AND MEMBERS OF THE SUBCOMMITTEE ON SURFACE TRANSPORTATION, I APPRECIATE THE OPPORTUNITY TO APPEAR BEFORE THIS DISTINGUISHED SUBCOMMITTEE WITH GOVERNOR DICK CELESTE AND MY COLLEAGUES FROM OHIO. I COMMEND CHAIRMAN MINETA AND THE SUBCOMMITTEE FOR HOLDING THESE COMPREHENSIVE HEARINGS ON REAUTHORIZATION OF THE NATION'S HIGHWAY, MASS TRANSIT AND HIGHWAY SAFETY PROGRAMS. LIKE MANY OF YOU, I HAD THE HONOR OF HOLDING LOCAL AND STATE OFFICE BEFORE BEING ELECTED TO SERVE IN THE U.S. HOUSE OF REPRESENTATIVES SO I AM AWARE OF THE NATION'S TRANSPORTATION NEEDS -- NEEDS THAT WILL INCREASE IN THE 1990s AND WELL INTO THE 21ST CENTURY.

HIGHWAY AND PUBLIC TRANSIT DEMANDS HAVE BEEN A MAJOR FOCUS AT EVERY LEVEL OF GOVERNMENT -- AND IN EVERY LEGISLATIVE BODY -- IN WHICH I HAVE SERVED. IT SEEMS THAT, NO MATTER WHAT PUBLIC ISSUE COMMANDS ATTENTION, ELECTED OFFICIALS CONTINUE TO FACE THE PROBLEM OF RAISING ENOUGH MONEY TO KEEP ROADS AND BRIDGES INTACT AND SAFE FOR THE PUBLIC TO USE.

I AM CONCERNED THAT CURRENT FEDERAL HIGHWAY FUNDING FORMULAS RESULT IN SYSTEMATIC DISINVESTMENT IN KEY SECTORS OF THE U.S. ECONOMY. BASED ON DATA FROM THE U.S. DEPARTMENTS OF TRANSPORTATION AND COMMERCE, THE 19 HIGHWAY "DONOR" STATES:

** GENERATE 54% OF THE GROSS NATIONAL PRODUCT;
** PRODUCE MORE THAN 58% OF U.S. MANUFACTURED GOODS;
** ARE RESPONSIBLE FOR MORE THAN 53% OF U.S. WHOLESALE AND RETAIL TRADE;
** GENERATE MORE THAN 56% OF THE TOTAL U.S. AGRICULTURAL, FOREST, AND FISHERIES PRODUCTION; AND
** GENERATE MORE THAN HALF THE VALUE OF ALL U.S. TRANSPORT AND UTILITIES, FINANCIAL, INSURANCE, REAL ESTATE, AND SERVICE INDUSTRIES.

I HAVE ATTACHED COPIES OF THIS DATA AND FORWARDED IT FOR YOUR CONSIDERATION.

IN VIEW OF THE DONOR STATES KEY ROLE IN THE ECONOMIC WELL-BEING OF THE NATION, IT IS IMPERATIVE THAT THESE STATES BE GIVEN EQUAL ACCESS TO DISCRETIONARY FUNDS WITHOUT PENALTY, AND A GUARANTEED RETURN OF 90% OF THEIR FEDERAL GAS TAX USER FEE CONTRIBUTIONS. IDEALLY, FEDERAL FUNDING FORMULAS SHOULD BE UPDATED TO BETTER REFLECT THE NEEDS AND USE OF THE COMPONENTS OF THE FEDERAL-AID HIGHWAY SYSTEM.

I APPRECIATE SUBCOMMITTEE EFFORTS TO MODIFY AND IMPROVE THE EXISTING FUNDING FORMULAS. EXPERIENCE HAS TAUGHT ME THAT SUCH CHANGES ARE DIFFICULT TO ACHIEVE. IN VIEW OF THIS, I SUPPORT THE REQUEST OF GOVERNOR CELESTE AND MY COLLEAGUES FOR A 90% MINIMUM ALLOCATION PROGRAM.

ANOTHER CRUCIAL INGREDIENT IN THE NATION'S TRANSPORTATION PROGRAM DEBATE IS COMPETITIVENESS. EVERY ELECTED OFFICIAL WHO SURVIVED THE RECESSION OF THE '70s AND EARLY '80s IN THE RUSTBELT KNOWS OF THE NEED TO KEEP OUR BUSINESSES AND WORKFORCE COMPETITIVE. COMPETITIVENESS -- BOTH AT HOME AND ABROAD -- HAS BEEN A CONSISTENT AND COMPELLING ISSUE FOR EVERY LEVEL OF GOVERNMENT.

THE U.S. RANKS FAR BEHIND ALMOST ALL OTHER INDUSTRIALIZED NATIONS IN CAPITAL INVESTMENT IN INFRASTRUCTURE -- INCLUDING JAPAN, FRANCE, WEST GERMANY, THE UNITED KINGDOM, ITALY, AND CANADA. BECAUSE OUR INVESTMENT IS SO VERY SMALL, IT IS ESPECIALLY CRITICAL THAT IT BE INVESTED WISELY AND FAIRLY. POSTPONING NEW CONSTRUCTION

CAN INCREASE OPERATING COSTS IN THE PRIVATE SECTOR, THEREBY REDUCING EVEN FURTHER THE COMPETITIVENESS OF AMERICA'S BUSINESSES.

IT WOULD BE A TRAVESTY IF SO MUCH OF THE WORK ALL OF US IN CONGRESS HAVE DONE TO IMPROVE U.S. COMPETITIVENESS THROUGH THE VARIOUS TRADE BILLS, THE JOB TRAINING PARTNERSHIP ACT, SMALL BUSINESS ADMINISTRATION PROGRAMS, AND OUR INVESTMENTS IN NASA AND RELATED TECHNOLOGIES, WAS UNDERMINED BY A HIGHWAY PROGRAM WHICH INVESTED CONTRARY TO THE NATIONAL INTEREST.

WHEN TWENTY-FIVE CENTS OF EVERY DOLLAR OF EXPORT GOODS IS SPENT ON THE TRANSPORT OF RAW MATERIALS, SEMIFINISHED GOODS, AND COMPONENTS BETWEEN DOMESTIC MANUFACTURERS, WE CAN'T CONTINUE SUPPORTING AN OUTDATED FEDERAL HIGHWAY INVESTMENT POLICY.

THERE IS ALSO AN ENVIRONMENTAL ISSUE I WANT TO BRING TO THE SUBCOMMITTEE'S ATTENTION. I AM ALARMED BY THE POTENTIAL FOR SERIOUS EARTHQUAKE DAMAGE IN OHIO AND PARTS OF THE EASTERN UNITED STATES. AS THE CHAIRMAN IS WELL AWARE FROM HIS OWN PERSONAL EXPERIENCE IN CALIFORNIA, EARTHQUAKE DESTRUCTION CAN DEVASTATE A COMMUNITY.

JOHN CARROLL UNIVERSITY, LOCATED IN MY DISTRICT, HAS A SEISMOLOGICAL OBSERVATORY WHICH HAS COLLECTED EARTHQUAKE INFORMATION FOR A NUMBER OF YEARS. FROM THIS DATA, SOME SEISMOLOGISTS HAVE REASON TO BELIEVE THAT MUCH OF THE BASEMENT ROCK IN THE EASTERN TWO-THIRDS OF NORTH AMERICA IS FRACTURED AND FAULTED. IF THERE ARE AS MANY FAULTS AS SUSPECTED, IT IS POSSIBLE SOME REGION OF THE EASTERN UNITED STATES COULD EXPERIENCE A MAJOR EARTHQUAKE AND INCUR SERIOUS

OF LIFE AND MAJOR DAMAGE TO THE INFRASTRUCTURE.

I AM SUBMITTING FOR YOUR CONSIDERATION A SUMMARY REPORT PREPARED BY WILLIAM R. OTT, S.J., DIRECTOR OF THE JOHN CARROLL UNIVERSITY SEISMOLOGICAL LABORATORY.

BECAUSE MANY BRIDGES IN OHIO AND THE EASTERN U.S. ARE BEYOND THEIR DESIGN LIFE, EARTHQUAKES POSE A PARTICULAR HAZARD TO THIS PART OF THE COUNTRY. THESE STRUCTURES WERE BUILT BEFORE MODERN EARTHQUAKE DAMAGE-CONTROL TECHNIQUES WERE KNOWN. BECAUSE OF THEIR AGE, THESE STRUCTURES ARE ALREADY FRAGILE. THE INFORMATION IN THIS REPORT CONFIRMS THE NEED TO INCREASE THE FEDERAL BRIDGE INSPECTION PROGRAM.

STUDIES CONSISTENTLY SHOW THAT AMERICA'S INFRASTRUCTURE NEEDS -- THE PRICE TAG FOR REPAIRING AND FINISHING THE NATION'S ROADS AND BRIDGES -- WOULD COST MORE THAN $100 BILLION. WITH THESE ADDED ENVIRONMENTAL CONCERNS, THE LONGER WE WAIT TO ATTACK THESE PROBLEMS, THE HIGHER THE PRICE TAG.

THANK YOU FOR YOUR KIND ATTENTION. YOU HAVE MY SUPPORT IN MAKING CHANGES WHICH WILL HELP CORRECT THE PROBLEMS I HAVE RAISED.

SEISMOLOGICAL OBSERVATORY

EARTHQUAKE FAULTS IN THE EASTERN UNITED STATES

For the last four years the Seismological Observatory at John Carroll University has been carefully monitoring several counties in northeast Ohio for earthquakes. We have found far more, low-level, seismic activity in this area than anyone had previously been aware of, or even suspected.

Similar studies in other parts of the Eastern United States and Canada have given seismologists reason to believe that much of the basement rock in the eastern two-thirds of North America is fractured and faulted. We know that some of these faults have produced major earthquakes in the past and will do so again in the future. The seismic and geological evidence that we have suggests that there are many other such faults that have not been detected because their recurrence interval is very long and they have been quiet during the two to three hundred years of recorded history in this part of the world. Such faults are usually covered by layers of sedimentary rocks and soils which makes their detection difficult and hides evidence of past earthquakes. They may, however, make their presence known by producing microearthquakes which can be detected if likely regions are properly monitored.

If there are as many of these faults as we suspect, it is only a matter of time before some region of the Eastern United States will experience a major earthquake and incur serious loss of life and major damage to its infrastructure.

SEISMOLOGICAL OBSERVATORY

EARTHQUAKES AND PUBLIC INFRASTRUCTURE IN NORTHEAST OHIO

During historic times earthquakes have occurred throughout the central and eastern United States and Canada. We know that these quakes can affect a much larger area than the same size earthquake in California and the western states. The seismic energy is transmitted much more readily through the crustal rock in the eastern part of the continent.

There are a number of areas in the east where seismologists would not be surprised if a moderate or even large earthquakes were to occur at any time. Northeast Ohio would seem to be one of these areas. Such area will suffer a variety of different types of damage to the public infrastructure from such quakes. Earthquakes of magnitude greater that five might be expected to damage energy and water distribution systems, transportation and communication systems, and do significant damage to some of the older and weaker structures in the area.

Such quakes could damage both the nuclear and coal fired electric power plants, in the area, as well as their transmission lines. Damage to a nuclear power plant would be especially disastrous if it resulted in the release of radioactive material into the atmosphere.

We know from past earthquakes in the area that water wells can be unusable, because of turbidity, for some time after the event. Transportation could be hindered by damage to rail lines and roads and the collapse of bridges and overpasses. Many of the bridges in the area are known to be in poor structural condition. Airports could be rendered unusable for some time if their control towers of runways are damaged. There are a number of petroleum pipelines in the area that may also be ruptured by such a quake. Spills from such pipelines could, in turn, cause long lasting environmental problems. Communication problems could result from the downing of telephone and power lines and damage to microwave transmission systems. Few, if any, of the buildings in this area were designed to withstand large earthquakes. There are no seismic building codes in this part of the country as there are in California.

INJECTION WELL AND EARTHQUAKES IN NORTHEAST OHIO

There was some concern after the January 31, 1986 earthquake in Leroy township of Lake County that it might have been induced by the operation of two nearby waste injection well. Two networks of instruments, one operated by Cleveland Electric Illuminating Co. and one by John Carroll University, were installed to monitor this area. A number of small quakes have been detected in the vicinity of these wells. Several studies have been done to investigate the connection between the wells and the quakes. One study by Moid Ahmad and Jeffrey Smith of Ohio University found that the pressure build up from the wells might have been sufficient to trigger the 1986 quake. Another study by Nicholson, Roeloffs, and Wesson finds that this quake probably had "natural" origins but that "triggering by well activities cannot be precluded". A study by Keith Evans of Columbia University has found that the earth's crust in this area is close to failure so the fluid injection could produce earthquakes.

During the summer of 1987 we recorded a number of earthquakes in the area east of Ashtabula Ohio. Several of the earlier quakes were large enough that they were felt by many people in Ashtabula and Lake Counties. Using data from the seismic networks to the west and from several portable instruments operated by the Lamont-Doherty Observatory of Columbia University, the epicenters were found to be very close to another injection well operated to the east of the city of Ashtabula. A study by Seeber and Armbruster has concluded that these quakes are "the best candidate yet for a macroseismic event in the eastern U.S. which has been induced by fluid injection in a deep waste disposal well". More earthquake activity has been detected in this area during December of 1987 and August 1989 that supports this conclusion.

Mr. MINETA. I would also like to call on our colleague from Ohio, Congressman Applegate.

Mr. APPLEGATE. Thank you, Mr. Chairman.

I have nothing to say at this point. I am very anxiously awaiting to hear the glorious words of our Governor and then will proceed from there.

Mr. MINETA. And our fine colleague from Ohio, Mr. McEwen.

Mr. MCEWEN. Thank you, Mr. Chairman. I think my colleague from Stubenville said it very well. We are delighted to have the Governor.

Mr. MINETA. Governor, your statement will be made a part of the record. Please go ahead and proceed in your own fashion.

Governor CELESTE. Thank you very much, Mr. Chairman. I appreciate the opportunity to appear before the House Public Works and Transportation Subcommittee on Surface Transportation to talk about Congressional reauthorization of the highway, transit and highway safety programs. I have to tell you I feel very much at home here with friends and colleagues like Congressman Applegate, Congressman McEwen, and Congressman Traficant as members of the subcommittee, and to be with the distinguished dean of the Ohio delegation and a great leader here in the Congress, Congressman Stokes. And I appreciate the fact that a number of my State's delegation have shared with you their views on this very important issue.

I apologize for my hoarse voice. The reason is that I spent Monday and Tuesday in six different communities across the State talking about transportation infrastructure, announcing a $1.1 billion investment over the next four years as we try to plan in a rational way and set priorities that will work for our community.

As Congressman Stokes indicated, we announced 88 different projects in 44 counties across the State. My voice may be worse for wear, but I think our infrastructure will benefit from wise planning and wise decisions.

Some of the very big projects, Congressman McEwen, relate to your district.

Mr. APPLEGATE. Governor, if I might just say, that is $1.1 billion.

Governor CELESTE. Billion. That is right.

Mr. APPLEGATE. I thought it sounded like million, and I didn't want to go on record that you only spent $1.1 million.

Governor CELESTE. No, billion.

Like many other Governors across the country, I was keenly interested in the unveiling of the President's Moving America policy as it was being unveiled. But, frankly, I was disappointed by what I saw. I think that Secretary Skinner provided us with an excellent analysis of the problems plaguing our infrastructure, but the plan, in my judgment, falls far short in terms of real solutions to these problems.

Instead, I believe that the Bush plan represents a reversal of the original intent of the Highway Act of 1956, the legislative embodiment of President Eisenhower's national system of interstate and defense highways.

President Eisenhower's plan was a clarion call intended to unite the nation, as he said at the time. I am afraid that the current

President's plan sounds a note of retreat from that ambitious purpose.

In his message, President Eisenhower noted the desperate need for highway development and really stressed that we had a major obligation at the national level to move forward. He saw the condition of our highway system as nothing less than a matter of our national defense. He was right then, and in this world of increasing economic competition Dwight Eisenhower is even more right today.

President Eisenhower went on to say in his special message to the Congress that in the case of the Federal Government, expenditures on a highway program are a return to the highway user of the taxes he pays in connection with his use of the highways. In other words, the notion has always been that the States should get back what we put in. But now, 35 years later, we are far from that reality. The Moving America plan moves us, all right, but further away still.

This year Ohioans will receive about $496 million in Federal aid highway funds. We will pay approximately $531 million in Federal gas taxes. In total, Ohio will lose about $35 million just this year.

Even with the enactment of the 85 percent minimum allocation provision in the 1982 Highway Bill, for which we were grateful, Ohio's cumulative return has been about $0.80 for every $1 sent to Washington. The irony is that in every major national infrastructure study which has been released during the past decade Ohio has ranked among the top five States in need measured against a lack of sufficient resources. Of our urban interstate, 13 percent—some of which I think you drove over, Mr. Chairman, at one point——

Mr. MINETA. I promised I would never mention that again. [Laughter.]

Governor CELESTE. I understand that. I am not mentioning any specifics. Twenty-two percent of our rural interstate and 21 percent of our bridges are considered structurally deficient. Although we have been experiencing nothing less than what I would call highway robbery for more than a decade, President Bush has proposed a plan which would make the situation even worse. Instead of repairing the inequities in the current allocation of funds, the President wants to fly the white flag of surrender over the Federal Government's leadership role and shift responsibility further to the States.

Secretary Skinner's introduction of the Administration's proposal I believe belied an unfamiliarity with what States like Ohio are already doing to try to address our infrastructure concerns. Contrary to what the Secretary seems to think, in Ohio we have been taking up the slack left by diminished Federal participation.

As I mentioned earlier, I was making major highway announcements throughout Ohio this week. We have funds for these highway projects because our legislature voted to raise the gasoline tax by 5.2 cents this past year. It was the second gasoline tax increase in three years.

As Governor, I know that raising the gas tax is never easy nor is there an outpouring of popular sentiment for it, but the State legislators, the business community, and the travelling public have

come to see the necessity of this additional revenue. We achieved bipartisan support for those tax increases.

In addition, Ohio has passed a $1.2 billion bond referendum to finance local infrastructure and road improvements.

These increases will put the current gasoline tax in Ohio at $0.20, one of the highest in the region, come July 1. We will spend more than $800 million this year in State funds on highway and bridge improvements. This is the reason that I was particularly startled when Secretary Skinner's major recommendation was that State and local governments do more. The Secretary even went so far as to say that the Federal Government cannot bail out every system that hasn't been able to care for itself.

Well, I disagree on two counts with the premise implicit in the Secretary's remark. First, infrastructure funding is not a Federal bailout. It is a Federal commitment, a Federal investment that Secretary Skinner and the President are abandoning—which contrasts, incidentally, with the Federal Government's response to the savings and loan crisis which was, in fact, a bailout. We have some experience with savings and loan crises in Ohio, too, so I think I can speak for the difference between the two.

I fail to understand why the Federal Government can be quick to come to the aid of failing private enterprises but cannot seem to find the money to assist State and local governments in meeting the critical need we are discussing here today.

While countries around the world are responding to the need for more efficient infrastructure, we are allowing ours to crumble. Why should the Secretary of Transportation have to go to Europe to see one of transportation's newest technologies, high-speed rail? The Federal Government should be leading our investment in such technologies here at home. Instead, its States—Ohio, Pennsylvania, Florida, and many other States—are struggling now to find a way to make high-speed rail work here in the United States.

We have been transportation innovators, and we have ceded that leadership, I feel, in a way that is disturbing.

Secondly, I find it ironic that the Administration would call into question the budget practices of State government when $17 billion of highway and transit funds are being hoarded to disguise the size of the Federal deficit. The results of this sort of budgeting for highways as well as for other vital services are obvious.

I am proud to say that in Ohio we have avoided such gimmicks during the past eight years. In Ohio "read my lips" doesn't build roads across the country. "Read my lips" doesn't build highways. States like Ohio are fulfilling our part of the Eisenhower bargain.

I believe the time has come for the Federal Government to step forward to become a full partner with us once again rather than sound the trumpet of retreat.

In an effort to reestablish this partnership—and because I want to be positive and my comments are hopefully helpful—let me offer some recommendations. These are very similar to policy principles that were adopted by the Nation's Governors at our recent meeting.

I want to suggest that the Federal Government:

Maintain a significant Federal role in assisting States in financing highway and public transit projects;

That we increase the Federal investment in transportation by fully utilizing the balances in the highway and transit trust funds;

That we increase the flexibility in Federal transportation programs. One of the reasons why the 85 percent minimum allocation program is so successful, besides the additional funds coming back to the States, is its flexibility. I want to underscore our gratitude for that. Ohio can use this money for any project, and it is not subject to the highway obligation ceiling.

That we initiate major changes in the distribution formulas which allocate billions of highway dollars.

Factors that reflect the relative use of highways are more equitable—especially now that the major portion of the infrastructure has been developed—to States like Ohio that have fewer miles of highways but are very heavily travelled. For example, Ohio has 3.4 percent of the nation's interstate miles, but 5.2 percent of the traffic on the nation's interstate.

We have to increase the minimum allocation program to 90 percent and make any discretionary money available to all States, including donor States.

While I hope that the Congress makes major structural changes to the Federal aid highway program that would eliminate Ohio's donor status—and I know that has been something our delegation has spoken to very eloquently—at the very least I would hope the minimum allocation would be increased.

Finally, that we maintain Federal funds for operating assistance for our increasingly important system of public transportation.

I might just note as a footnote there that the State of Ohio also began seven years ago to use State general revenue funds to help our public transportation systems across the State.

Mr. Chairman, only with the firm adoption of these principles can we achieve the Federal participation so crucial to the rebuilding of our nation's transportation infrastructure. The President, Secretary Skinner, and many Members of Congress should be applauded for identifying infrastructure as a priority, and the President's voice on this is very important. However, the real measure of the Administration—and, frankly, of the Congress' resolve, as well—will be whether the rhetoric is matched with Federal funds. As we say in Ohio, this is where the rubber hits the road.

I appreciate having this opportunity to share these thoughts with you, Mr. Chairman. Before I was Governor and before I was in public life I was a student of history. I think it is worth reflecting on just a footnote to our history.

Albert Gallatin, Secretary of Treasury under President Jefferson, developed a plan for an elaborate network of canals and roads to promote national defense and economic development. He convinced Congress to finance the construction of these public works through an innovative funding arrangement. Because of Secretary Gallatin's efforts, in 1802, in the act that admitted Ohio into the Union, that Act earmarked 5 percent of Federal land sales in the new State for building roads linking the State with the navigable waters flowing to the Atlantic. The initial product of this effort was the nation's first interstate highway, the Cumberland Road.

Mr. Chairman, thank you again for this opportunity. With this important history in mind, I look forward to our continued work together.

Mr. MINETA. I appreciate, Governor, your very fine statement. This shared highway, the Cumberland Road, is still eligible for 3R and 4R funding. [Laughter.]

My good friend is nodding his head no.

The recently announced transportation policy, Governor, advocates greater State and local government responsibility for meeting transportation needs. In view of the fact that the State of Ohio has now raised their State gasoline tax to one of the highest in the nation, does the State of Ohio have the resources to continue to absorb the shortfall in Federal funds for transportation?

Governor CELESTE. Mr. Chairman, I have ambiguous feelings on this matter. I think that the people of the State of Ohio and the General Assembly are determined to do everything we need to do to have a first-class transportation infrastructure because it is so vital to our economic welfare. Every single major corporate investment in Ohio in the past ten years—Honda's location in Ohio, Honda's second plant in Ohio, a major Ford-Nissan joint venture up near Cleveland, the relocation of a Fortune 500 plant into Congressman Stokes' district—every single one of them has required a major commitment of highway dollars, usually of infrastructure funds to help extend rail to those sites, in order to grow.

So there is a very strong determination by the State to do what it has to do to meet these needs, but there is a growing sense that the system isn't fair.

On the one hand I think that there is a strong will to provide those resources, and we have demonstrated it already. I would hope that if there is some change in Federal formula that it would take into account what States have already been doing.

But I think that Ohio's determination is really a reflection of a national sentiment that says we really must do more in this area and a sense of frustration that the partnership that we had enjoyed for many years between the Federal Government and the State has somehow now gotten out of sync.

Mr. MINETA. Now, as the committee considers reauthorization legislation for the surface transportation programs, we will be extending the Federal/State/local partnership to include the private sector. I am wondering, in the State of Ohio, Governor, has—from what I understand, again, the State of Ohio has used the transportation infrastructure to encourage private investment in the State, as you have indicated by some of the examples. Has the State also seized the initiative to induce the private sector to contribute towards the building of that transportation infrastructure?

Governor CELESTE. Yes, we have, in ways that are not well institutionalized at this point, Mr. Chairman. We, for example, have sought private participation to help pay for some of the costs of highway improvements where we could identify a direct beneficiary in the private sector side. In some occasions engineering costs for a major new interchange would be picked up by the private sector where the construction costs would be picked up by the public sector. And there have been what I would call ad hoc in-

stances where we have sought private participation on the highway side.

We have worked probably for almost ten years or maybe more than ten years on the issue of high-speed rail in Ohio. At this point the proposal to move forward in high-speed rail envisions a 100 percent private initiative in which the public sector might provide some seed money with a return from the private sector to do this.

So I think there are several different examples of the way in which we have looked to a direct involvement of the private sector in the infrastructure, in itself. Generally speaking, the relationship with the private sector has been that we provide the transportation infrastructure, you do the investment that generates jobs. The State spent $78 million on highways for Honda; Honda now has invested in excess of half a billion dollars, probably approaching $1 billion, and has generated 4,000 or 5,000 jobs.

Mr. MINETA. But I am wondering if we are not always trying to play catch up ball. We never get to the point of having an adequate cloverleaf at some intersection because the plant is going to be located here. By the time the plant is located, maybe then up the road a shopping center gets developed. To what extent then, as that continues, do those additional developments contribute back to that original overpass or turn-off or whatever that creates the attraction, as well as becomes a real impediment in terms of traffic flow?

Governor CELESTE. I think it depends. Where we have an opportunity, where we can specifically identify a cost and ask them to participate, we do increasingly.

Mr. MINETA. Is that something that local government has a better handle because they can withhold zoning more so than any kind of leverage that the State has on what happens?

Governor CELESTE. It depends on who the toughest bargainer is. I think sometimes local government can be very effective, but frequently the lure of additional tax base or additional jobs is so strong that they are ready to do everything they can and it is easier for State government to say, "We are prepared to do the highway work. What we would like you to do is to pay the cost of engineering."

Mr. MINETA. I think that is the reason why the Secretary uses that, as you said, the bailout approach in the sense that we have people coming on a regular basis and saying they need Federal on this, and yet, from our perspective, I guess we look at it and ask what the Federal perspective is on what is being done here. Is it a State or local perspective? What is the Federal public policy interest? I know there is a rationale for it in some of these, but I am not sure that all of the examples where Members come and say they need this for State and local development that, given the constraints on us, we can say yes to a lot of these programs. I am just trying to figure out what the criteria is that we ought to be using to say yes to Project A but no to B and we'll help you some on project C.

Governor CELESTE. Mr. Chairman, I think it is very difficult in mapping a national strategy to be project specific. I respect that problem. I think it is very difficult to be project specific when you are working at a national level.

I think that part of a national transportation policy is to set certain standards and guidelines as to who will contribute what to make the partnership work. If part of that is to say to the private sector more explicitly than we have in the past, "Look, we think where there is a direct benefit to you. You ought to pay engineering costs for this," or some other formula that could be applied on a general basis, it would help everyone. That would help State officials. That would help county engineers and local communities in their decision making. And it would reduce what can happen where you start to have States bidding against each other or communities bidding against each other on the basis of what they can afford to do and other communities become seriously disadvantaged.

I take as the context the Eisenhower period when we were looking at national defense as a rationale for a national strategy. People agreed with that. Now we are looking at economic competitiveness as the real arena for our national struggle and survival. And if we take Europe as an example of our competition where there will be a single market in 1992 and what they are doing in investment in transportation systems, they are making a major investment in transportation systems—highways, tunnels, high-speed rail, every aspect of this. I think we have to somehow or another think of it in that context.

I believe the users are willing to pay. I think what we have seen over and over again is that the users are willing to pay. Part of the frustration is when those user dollars don't come back to do what they were intended to do, whether that is highways or public transportation or rail innovation.

Mr. MINETA. Let me touch on something else, and that is the sanction provision.

Under the Federal aid highway program, we have certain sanctions that relate to requirements that encourage States to enact laws relative to safety. We have them as they relate to the 55 mile per hour speed limit, drinking under 21, child restraints in automobiles. I am wondering if you could recommend to the committee any incentives that would have the same effect as sanctions?

Governor CELESTE. Mr. Chairman, rather than answer that off the top of my head could I think about that and send some thoughts to you?

Mr. MINETA. Absolutely.

Governor CELESTE. Because it is a very important question and I would like to give it more than a casual answer.

Mr. MINETA. Finally, Governor Celeste, the committee has received testimony in support of several meritorious Federal aid highway projects such as the Center Street Bridge, a bridge crossing the Meander Reservoir, the Hubbard Expressway, the I-680 access ramp development project, the I-280 Craig Memorial Bridge, the Buckeye Basin Greenbelt Parkway, the new Maumee River Crossing. Your representatives from the State of Ohio have been very——

Governor CELESTE. They all sound excellent to me. [Laughter.]

Mr. MINETA [continuing]. Very creative and very forceful in their presentations.

If additional funds from the Federal perspective are not made available for these very, very meritorious projects, how would the State provide for the construction of these important projects?

Governor CELESTE. Mr. Chairman and members of the committee, we have tried to follow a policy which I began when I ran for the office of Governor. I never promised a highway project unless I knew where the money was to build it. In fact, the only highway project I promised when I was running for Governor was in Congressman Applegate's district, and that had been promised for 25 years and is now under construction.

Some of the projects you have mentioned are projects in which the State has made a commitment to participate. We will fund projects within our resources. As I indicated, we have just had an increase in the gasoline tax. We try to base those priorities on the recommendations of local officials who will often set a very high priority on a project that has previously not been on the construction list.

I would like to say that the State would be able to do everything that the Federal Government could not see its way to do, but I wouldn't be honest if I suggested that. We take up these projects as quickly as we can. We do projects with 100 percent State funding. In fact, we have chosen to do some projects that way because we could build them faster than if we tried to do them with the Federal match, so we have reduced the construction time by two and a half years and probably saved some money as a consequence.

I think a number of these projects have considerable merit, and I would hope that, in its wisdom, Congress would find a way to be supportive of them.

Mr. MINETA. Wisdom is long, cash is short.

Mr. Shuster?

Mr. SHUSTER. I have no questions. It is nice of you to be here, Governor.

Mr. MINETA. Mr. Applegate?

Mr. APPLEGATE. Thank you, Mr. Chairman.

Governor, thanks very much, of course, for being here on behalf of 11 million people in the State of Ohio who have been donating many of their hard-earned bucks into the Highway Trust Fund and getting less back for their money.

I want to say this about the Governor, too: he did, when he was running for Governor of the State of Ohio, come into my area and looked and talked with our local people. To my knowledge, that is the only promise that he had made on a highway proposal, and he delivered. It is a major step in our area.

The Governor did talk at one point about a $1 billion release of projects that he has just gone around to the State and I think in half of the State he said we had some projects, but he didn't say about in October when he also went around the State and got laryngitis again releasing some other money for highway projects. Could you just make a reference to that, Governor? I think that is very important just to show what Ohio—what you have been doing.

Governor CELESTE. Mr. Chairman and Congressman Applegate, when the legislature decided to raise the gasoline tax in June and that became effective in July, what happened was that we immediately became the beneficiaries of additional money available for

construction. So at that point I went to the Department of Transportation and said that we have projects that are mature to the point where we can get them to construction promptly and it is my goal to put this money to work, not to let it sit there. That is the intention of the people who are paying the tax.

And so we announced a series of projects in October that I think totaled more than $90 million in this year. In fact, Congressman, we are having a special bid letting—today is the 22nd, right?

Mr. APPLEGATE. Yes.

Governor CELESTE. We will have a special bid letting tomorrow. Normally we do two contract bid lettings each month. On the 23rd of March there is a special bid letting for $73 million worth of the $90 million that is done in the first year of the biennium. The total amount is almost $260 million of additional construction that was made possible to be operated on a biennial budget for the biennium for new highway construction. So those projects were announced last October.

This $1.1 billion is the next stage after that to carry on a rational construction program.

Mr. APPLEGATE. And I think that is very good. And you had mentioned, of course, that the people in the State of Ohio, through the State legislators, then increased the gasoline user fee, which shows that Ohio really has shown responsibility in all of this. I agree with you—try to put it together to find out, because I think, too, there is a shift in the direction of the Administration now as to what the Bush Administration wants to do in relationship with what Secretary Skinner said. It is going to make it very difficult.

Here we have two things: one, they want to put all of the responsibility back on the local level—read my lips—no new taxes over here but we are going to tax the people back in the local district, but that is going to have to be up to the local people to do. And yet they are showing a warm reception to Rostenkowski's proposal which calls for $0.25 additional on a gallon of gasoline to try to reduce the Federal deficit.

Well, as I said before—and Lew, you were here last week—if anything like Rostenkowski's bill would get out, that would just kill every opportunity for every local community to be able to try to assume any responsibility that the Bush Administration wants to place back there.

So I just think, at least in Ohio's case where we have been a donor State, we have been punching out a lot more money than we have been getting back in. And we have a commitment to try to fulfill to the people of Ohio to try to finish off the highway systems, to improve them, rehabilitate, and to improve the infrastructure which, of course, Lew and Mary Rose and some of the others were sitting before us last week and showed the enormity of the problem—the deficiency, as you have pointed out in your testimony, on the highways and the bridges—the deterioration and all.

And another thing I want to say is that Ohio, while we—we cost share. Any project in any other district in the United States Ohio is helping to pay for. The same is true with the savings and loan situation, which is going to be $150 billion to $300 billion. But when we had a savings and loan problem the Federal Government didn't come and give us a nickel. I want to commend the Governor

for that because you were able to put that together to save these small thrifts and work this deal out, and Ohio did it within its own structure, and I thought it was done exceedingly well.

I would just mention about a couple of things that you said, Governor, that I think most of us probably agree on—and I intend to offer an amendment to increase that minimum allocation, whether it be from 85 to 90 percent or whether it be to 100 percent, I don't know.

Governor CELESTE. I would start with 100. [Laughter.]

Mr. APPLEGATE. I think that is a good idea, then compromise to 99. I think we could do that. But even at 90 percent Ohio could realize $130 million to $140 million additional, which I think would be very important. And when we look at States like Pennsylvania, which is getting 110 percent—and I don't see that much difference between the two—I think the distribution formula—and I agree and I was very happy to see the ranking member of the committee express his sympathy for a restructuring of the distribution formula. I think that he feels it is inequitable, and I think it should be restructured. In that way we are going to see maybe more dollars come back to the States of need and to the States that have been the donor States. And the other, of course, is that the trust fund should be taken off budget and whatever amount—the $12 billion or $17 billion—instead of using it to show a lower deficit, for that money to be released so that we can spend it for the purposes for which it was paid. I think it is very important.

So I would just say that there is a need to help Ohio and the other donor States. Ohio—who, incidentally—and I'm sure everybody knows and I don't have to tell anybody—was an economic giant at one time. We are coming back and we are going to get people to come back to Ohio. We did increase in our census. We will show a small increase, but not enough, because we are going to lose two Congressman. But people are going to come back because they are going to see that it is a better environment. We have fresh water. And the highways are going to be very important in this whole thing.

The donor States—and I think the figures were brought out before that since 1982 the donor States have paid out $32 billion more than we have taken back in. That might be a figure that Lou Stokes brought up last week which I was very impressed with.

So Ohio and its 11 million people, like all the rest, do need a lot of help. We hope that what we are doing here now and with the help of our ranking minority member, as well as our very gracious chairman from California, who also comes from a donor State, will see fit to restructure the formula and see that more monies come back and on a more equitable basis.

I thank you very much, Mr. Chairman.

Thank you very much, Governor.

Mr. MINETA. Mr. Hammerschmidt?

Mr. HAMMERSCHMIDT. Governor Celeste, we are delighted you are with us today. We appreciate your statement, and we especially appreciate your bringing Lou Stokes over here from the very important committee to be with us.

Governor CELESTE. Thank you.

Mr. HAMMERSCHMIDT. You know, to give myself some credentials I want you to know I am from a donor State. But let me go back with you in time to 1956. We have spent about $125 billion since then on the interstate program. I guess that original—it was a 40,000-mile national highway defense network system. Later it became 42,500 over time. But I guess the idea was that it was a national system and some States at the point of tax collection would have to give more than others. Now there are 19 donor States. That shifts from time to time.

But the idea is that because it was a national concept that's the way it worked. Everybody understood that was the way it worked and everybody benefitted from it.

Now it is the post-interstate period and we are writing new legislation. We may very well want to write new policy and figure out where we are going to go from here after the 42,500 miles.

We are all for expending money out of the trust fund and we try to get the money out of the trust fund. We have had votes on it here in the Congress. That is a major issue with us. But, as you know, ever since President Lyndon Johnson started holding up money in the trust fund it has been very hard to wean the Executive Branch away from that because of the budget problem, and so we are still holding up money there.

But there is more to it than that. You know, they allocate this money and DOT and the Executive Branch say, "Well, we don't have any money because we have allocated it all." Do you know that about $275 million is behind held up for the State of Ohio and about $40 million from the State of Arkansas—and I don't know the California figure, but it is about 48 percent—because Congress placed the obligation ceiling on there? The Appropriations Committee, in consultation with the Budget Committee, have held those funds up. I think it is important that we make that point because it is a major system problem and one that has to be resolved. We have to do this together with the Executive Branch, and I fell that we will.

I think under Chairman Norman Mineta and certainly other members of this committee—we all have strong feelings about it, and I know we will work with the Appropriations Committee to try to resolve this problem.

But if a President comes into office and he has got $150 billion budget and you say let's take these trust funds off budget. There is about $20 billion worth of them in aviation and highways. Is he going to say, "Yes, let's take them off and I'll have $170 billion deficit."?

Well, you know, if you were President, just like you are a Governor, you would be very hesitant in doing that. I just make that point. It is a very complex problem. It is a difficult one to solve. But we do appreciate your statement this morning, Governor. It was very helpful to us.

Governor CELESTE. Thank you very much, Mr. Hammerschmidt. You are absolutely right, Congressman. Fortunately, we budget differently at the State level than at the Federal level, partly because most of us can't deficit finance.

Mr. HAMMERSCHMIDT. We have that same Constitutional provision.

Governor CELESTE. We have a capital budget and an operating budget, and we actually have a transportation budget which is separate so that we can really account for those dollars directly.

There are two thoughts that I have. One, in terms of money out of the trust fund, I agree very much that this is a concern addressed both to the Administration and to the leadership of Congress and Members of Congress. There has to be an agreement about the release of those funds, and my own feeling is that even if we leave what has been used in the past it would be terrific if, starting this coming year, we could allow the allocation of all of what comes in to be part of that.

The National Governors Association has asked that the cap be raised from $12 billion to $15 billion which would, in effect, essentially allow for the money that is coming in to be allocated. That would not all be outlays, at least in the first year. Again, I am not sure that I fully understand how all of these things work, but I think it is something that would have to be dealt with.

The second point I would make goes to this notion and was implicit when we got started with the program in 1956. If you look at a State like Ohio—and I think this is one of the misperceptions behind Secretary Skinner's comment about changing Federal formulas—the State of Ohio has about 113,000 miles of highway. Only about 25,000 miles of highway are miles on which there is any Federal participation. So our responsibility, working with local government, is to deal with 113,000 miles of highway. When you change the formula on the 25 percent or less of highways that we have of Federal interest, that is squeezing resources that we need to use over a much larger area. That is true in Arkansas, it is true in California, it is true across the country.

I think it is really important for us to try to help people understand this. As I said, a stable partnership between us on which we could count on the relationship over time is essential when we are dealing with infrastructure, which is long-term investment.

Mr. HAMMERSCHMIDT. Thank you. I think these dialogues and certainly your testimony are all very helpful to the process. I know Chairman Mineta and I have been out speaking to a group in California on the weekend, and there is a generally feeling that not only do we want the $15 billion, but we want to get it up to $23 billion or $26 billion to help this nation's infrastructure, but, of course, that is going to take more dollars and we have to figure out where those dollars are going to come from. Obviously, it will have to come from users in some way or the other. I want to throw that out as a comment about the general direction in which the chairman wants to go, and I think all of us want to go.

Thank you.

Mr. MINETA. Thank you very much, Mr. Hammerschmidt.

Mr. McEwen?

Mr. MCEWEN. Thank you, Mr. Chairman.

Governor, thank you for being here. I think most of the topics have been covered well. I express again my strong support for taking the trust funds off budget. As our colleague from Arkansas has just mentioned, one of the real difficulties is that the Byrd Amendment says that you can only expend the amount of money that you have for that year plus two years of outlays. That has to

be kept in reserve in the trust fund at all times, and that literally absorbs all of the trust fund.

Secondly, your reference to the fact that just to make sure the money going in doesn't get any bigger, I would point out that over the 1980s we have expended slightly more. I use the term "slightly." The Office of Management and Budget says they have spent more than came in during the 1980s. It is actually about a 1 percent difference. But we have at least spent all the money that came in and a little bit more, but that does not dissuade me in the slightest from wanting to get at the rest. So I thank you for your testimony.

I never miss opportunities like this, also, to say that I think Ohio as one of the best offices on Capital Hill. I refer to it as the Ohio Office, but it is your office. They do an excellent job and we are all dependent and grateful for them.

You made reference in your testimony to flexibility, which I think is exactly the direction in which we need to go. Each State has different needs. Recently, trying to drive between Fort Lauderdale and Miami, that is an absolute disaster. I would hate to think that we are responsible for setting up all of the criterion whereby States have to decide how those funds are spent. We in Ohio appreciate that flexibility.

Also I would mention this in relation to your discussion about the formula: the formula is significantly better than it was in 1982. There were tremendous reforms. I will say that Pennsylvania is a very talented, capable State that has many talented, capable representatives. If they are getting 110 percent, that shows the skill with which they choose their leadership. [Laughter.]

Mr. McEwen. Let me also add, however, the our funds were virtually tripled to Ohio, but it does leave us in the position of being a donor State which, of course, someone has to be because all of America benefits and all of Ohio benefits because there is an interstate system across Nebraska and Nevada and Utah. But your reference to the suggestion now that we have built it—we had to donate in order to get it built in South Dakota and Montana, but now that it is built we should look at the rate at which it is consumed, and that is the miles travelled. I am sure that we will take that into consideration on establishing the new formula.

I just have to be a little bit—I debated whether or not to say it. There is a sucker punch in your testimony, and that is about the bailout of the savings and loan. I would not be so disingenuous as to suggest that the efforts by Ohio to restore their depositors' savings was an effort to bail out any private entrepreneur. I think that what Ohio did to save its savings and loan was done for the effort to be fair to the depositors and have their money restored and the confidence of the savings and loan system.

When Franklin Roosevelt made that commitment on behalf of the United States in the 1930s that whoever would place money in the United States would have the assurance that no one could run off to the Bahamas and they would be left with their savings gone, that time came due and that tab was presented and this Congress did what was right for America, in my judgment, and said we will honor those obligations. I would not want to refer to that as an effort to save private enterprise, as such, because those entities

have disappeared and are rapidly disappearing. They are no longer with us, but the depositors have been protected. I think that was the fair and equitable thing for America to do.

Thank you.

Mr. MINETA. Mr. Packard?

Mr. PACKARD. Mr. Chairman, I will defer to Mr. Clinger.

Mr. MINETA. Mr. Clinger?

Mr. CLINGER. Governor, we thank you very much for your testimony. I think it has been very helpful to us.

One of the options that we have, I suppose—I don't present it as a very realistic option—would be for us to, since we built the interstate and the Eisenhower dream has been fulfilled for a national interstate system, to just drop the $0.09 and allow the States to increase their taxes by the difference. Wouldn't you be better off when you control your own destiny by having the ability to raise your own taxes by $0.09?

Governor CELESTE. That is very attempting. Mr. Chairman and Mr. Clinger, that is a very tempting through. There have been times I think when several of my colleague Governors and I have said we would be better off if that were to be the case. But I think there are also dimensions of transportation beyond highways that we need to remind ourselves about. Public transportation is very important. It ties in directly with the whole efforts on the Clean Air Act and leadership on new transportation systems. I don't know exactly how that fits in with what the next stage is, but I would certainly put that before you, as a committee, as a place which is consistent with our sense of ourself as a nation.

If President Eisenhower had the vision to see what was needed and created an interstate system, the question for us in the 1990s is: what is needed for the 21st century and can we envision that and articulate that and find an appropriate way to fund it?

Mr. CLINGER. I would just point out that President Eisenhower had something to help sell the idea of the interstate system that we maybe will not have in the future, and that is that he sold it as a defense highway system. That was really the basis on which we got the impetus and the national backing for it because there was recognition we needed to have a national interstate system to move men and materials around.

I am not sure that defense is going to be that central to our thinking in the future, but I do agree with you that we need to have a national focus on the USOC. I was really being somewhat facetious.

I just want to express my appreciation to my colleague from Ohio for his kind remarks about the Pennsylvania delegation, as well. [Laughter.]

Mr. MINETA. Mr. Packard.

Mr. PACKARD. Thank you, Mr. Chairman.

I agree that the next long-term transportation plan is going to need to be a national plan that will address a lot of research and development in terms of smart highways and smart vehicles and a variety of other things. It will help us address the transportation of the future.

But the dollars are simply not there now, nor will they be even if we release the trust funds—which I certainly have supported and

would like to see us do—to where they can be used for transportation purposes. But even if we released all the trust funds there simply would not be enough money to do all that needs to be done in rebuilding America's infrastructure—particularly as it relates to transportation. That means that the States and local areas will still have to look at innovative ways of developing new resources. Some States and some areas are doing that.

In our State in California the bulk of the metropolitan counties of California have passed bond elections or tax elections that call for a half cent sales tax earmarked strictly for transportation. My county has done it, and most of the Southern California counties and the Bay Area counties where the chairman and others are have done that. That will bring in billions of dollars into local highways, local streets, and county highways that will not be funded only by State and Federal moneys.

Has Ohio considered that? Or is that happening anywhere in your State where efforts are being made on a local basis to augment what will be coming, even short as it may be, from Federal and State resources?

Governor CELESTE. Well, we have—there are several examples.

Mr. PACKARD. I might add, Governor—and I apologize for interjecting—that we also will have on the ballot a gas tax increase of $0.09. So we are doing that at the State level, as well. But I am talking now about local, county-wide sales tax—half-cent or one cent sales tax—earmarked specifically for mass transit and for county roads, as well as for local streets.

Governor CELESTE. Mr. Chairman and Mr. Packard, yes, we have counties that have earmarked a portion of the sales tax, usually for public transportation rather than for highway purposes. There are two things. When we raise the gasoline tax in Ohio we have a formula for a portion of that going back to counties for their use. In addition, we have given them an opportunity to piggyback on our license tag fee. They have an optional ability to increase that fee locally for highway use. Many of the counties now have exercised that option to generate additional resources locally.

I think that your point that there will be great inventiveness on the part of State and local officials to try to devise appropriate revenue sources for this kind of transportation investment is absolutely on target. We will continue to do that.

Mr. PACKARD. That's all I have, Mr. Chairman. Thank you.

Mr. MINETA. Very well. Thank you very much.

Governor, let me thank you very, very much for your presentation here today and for your leadership not only in your State but also with the National Governors Association. I know that infrastructure is a big issue with the NGA, and you have been an integral part of that discussion. Again, thank you for your presentation here, as well as for your leadership.

We will continue to have a dialogue with NGA and with you, specifically. Let me also say that you are being well represented in terms of your highway interests here in Washington, DC.

Governor CELESTE. Thank you very much, Mr. Chairman. I appreciate the kindness of the committee in hearing the testimony today and your interest and concern and would be happy in any way to try to be helpful as you pursue your deliberations. I will

38-253 O—91——44

send you some thoughts on incentives versus penalties on that matter.

Mr. MINETA. Thank you very, very much.

[Mr. Celeste's prepared statement appears on page 1410.]

Mr. MINETA. At this time I would like to call on the President of the Kemper National Companies, Gerald L. Maatman, who is the Co-Chair of the Advocates for Highway and Auto Safety; as well as Joan Claybrook, the President of Public Citizen and Co-Chair of the Advocates for Highway and Auto Safety; accompanied by Judith L. Stone, the Executive Director of the Advocates.

It is a pleasure to have Mr. Maatman and the former administrator of NHTSA before us. Mr. Maatman, just let me preface by saying my background is insurance brokerage. I was an independent agent. You know me better as VF461074. [Laughter.]

That's my policy number.

Mr. Maatman, your statement will be made a part of the record. Please proceed in your own fashion.

TESTIMONY OF GERALD L. MAATMAN, PRESIDENT, KEMPER NATIONAL COMPANIES, AND COCHAIR, ADVOCATES FOR HIGHWAY AND AUTO SAFETY

Mr. MAATMAN. Thank you very much.

I am Gerald Maatman, President of the Kemper National Insurance Companies and Co-Chair of the Advocates for Highway and Auto Safety. This is a new coalition of consumer, safety, and insurance organizations which was formed about six months ago to promote highway and auto safety, to reduce death, injury, and economic losses due to motor vehicle crashes.

Advocates is working at the Federal, State, and local levels to improve highway safety, and we have a strong interest in seeing that the highway program reauthorization emphasizes the importance of tougher laws and other programs for safer highways.

With me today is Joan Claybrook, former NHTSA administrator, who is also president of Public Citizen and who I am pleased to say is our co-chair of the Advocates. We also have with us Judith Lee Stone, our Executive Director.

Joan and I will share the testimony and will summarize the key points.

The Advocates has identified a number of critical issues to advance highway and auto safety in the coming decade, and we are trying to develop and implement strategies to address them. Many of the problems for which we seek solutions are certainly going to be permanently affected by the highway bill that will be shaped this year and next in this committee.

Our safety emphasis includes the following:

Drunk driving countermeasures, including passage of administrative license suspension laws in the 22 States without them. Also, open container laws and the promotion of roadside sobriety checkpoints.

The second area is occupant protection legislation, including passage of safety belt use laws in the 17 States without them. Also the upgrading of existing laws to provide for primary enforcement; and more and better protection for children, both in child safety seats

and safety belts; and also better education about and the promotion of air bags.

Another area is adoption of motorcycle helmet use laws covering riders of all ages. Specifically, we support motorcycle helmet and safety belt use legislation which is being sponsored in the Senate by Senator Chafee and in the House by Representative Cooper.

We also support a return to the national maximum speed limit of 55 miles per hour, increased enforcement of all speed limits, a ban on radar detectors in both trucks and passenger cars, and the promotion of responsible advertising on the part of auto manufacturers that does not glorify fast and powerful cars and driving practices.

We also support renewed emphasis by the Federal Government, specifically by increased tough enforcement of existing standards for roadway appurtenances; and to improve worker and motorist safety by using high-standard equipment in construction areas that are already open to traffic.

We also emphasize opposition to wider, longer, and heavier commercial motor vehicles and to their access to additional roads; and we support more effective truck braking systems, including more widespread installation of anti-lock brakes in big trucks.

We certainly also are supporting more funding and other support for enhanced traffic safety law enforcement and additional funding and emphasis on research, development, and demonstration grants for highway safety programs.

Finally, we support quick and effective promulgation of new Federal motor vehicle safety standards to improve side impact passenger protection, to upgrade all standards to apply to vans and light trucks; and to improve child restraint, pedestrian, and rollover crash protection standards.

We also support reauthorization of the National Highway Traffic Safety Administration motor vehicle safety program. Senate bill 673 has passed the Senate and now lies dormant in the House.

Joan?

TESTIMONY OF JOAN CLAYBROOK, PRESIDENT, PUBLIC CITIZEN, AND COCHAIR, ADVOCATES FOR HIGHWAY AND AUTO SAFETY, ACCOMPANIED BY JUDITH L. STONE, EXECUTIVE DIRECTOR

Ms. CLAYBROOK. Mr. Chairman, over 45,000 people still are killed every year on our highways and hundreds of thousands more are permanently injured. Our nation is paying an enormous and unnecessary price in dollars, family tragedy, and in loss of productivity because of this.

To address this national tragedy, I would suggest the following:

That the successful Federal/State/local partnership for highway safety through the Highway Trust Fund be continued, and funding for its major grant and research and demonstration programs be increased. These include the section 402 State and community grant program, the sections 408 and 410 alcohol safety incentive grant programs, the section 403 research and demonstration programs, the Federal highway safety construction grant programs—hazard elimination and rail highway grade crossing—and the Federal motor carrier safety grant programs.

We also support existing highway safety incentive grant programs aimed at curbing drunk driving, which we believe should be combined into a single program and expanded to address, as well, occupant protection, speed, and other high-priority safety issues.

Additional emphasis should be placed on the need for accelerated research and supporting data collection—its analysis and dissemination—regarding types and severity of crashes, injuries, and fatalities, in order to better assist in the identification of new vehicle, roadway, and driver behavior safety programs. With the number of new laws and programs that have been adopted in the 1980s, we think this is a particularly important issue.

We are at the beginning of a new decade and approaching what is potentially a far more complex, dangerous, and expensive new century. Our group, Advocates, has chosen to lobby aggressively for tough, strong, effective laws and regulations to serve as the foundation for the society's efforts to stabilize and prevent costly injuries. We know that these laws work. We have data. We know that they pay off—they save lives, they reduce injuries, they save costs.

We believe that they could be even more fully effective when combined with highly visible police enforcement, public education, and publicity about safety enforcement. We also know that this works, and we know that the general motoring public is supportive of such programs.

Highway and auto safety has come of age in recent years. Even Lee Iacocca is supporting this, as you know.

Some motor vehicle manufacturing leaders are marketing safety; others, unfortunately, haven't yet adopted such programs, but we think they might. Other industries recognize that they can no longer afford not to require safety belt use for their employees or install air bags in their fleets.

Victims who have survived crashes or who have lost loved ones in a crash dramatically demonstrate the needless nature of lost lives and crippling injuries and teach us that such a high price need not be paid.

It is important to point out, Mr. Chairman, the high payoff of this program in terms of the numbers of lives lost. People who die in highway crashes are young. This is the largest killer of people under age 45. When you compare, for example, the years of lives lost to cancer is 1.7 million and the number of lives lost to heart disease and stroke is 2.1 million, whereas the figure for injuries is 4.1 million, the majority of which are motor vehicle injuries. Therefore, the investment that is made in saving lives in this program has a tremendous payoff.

Therefore, we urge you and this committee at this critical point in the lives of these programs to increase the resources at all levels.

Since passage of the Safety Acts in the 1960s we have learned that these investments pay off: They avoid crashes, they protect highway users should a crash occur, and they are cost effective.

It is quite clear that it is not the time to pull back or even to accept the status quo if we are to build on our knowledge of how to successfully prevent death and injury on the highway. These programs need a boost in funding and increased emphasis in the overall highway program.

Thank you very much for the opportunity to testify. We would be pleased to answer any questions.

Mr. MINETA. Very well. We now have a call of the House for a vote, and so at this point I am going to recess before getting into the question and answer period since we have a procedural motion on the floor and a number of us are going to have to get over there to have explained to us what is going on. So at this time I would like to recess for about 15 minutes.

[Recess.]

Mr. MINETA. Let me reconvene the meeting, if I might. I apologize for this recess.

I know you are a newly-formed organization, but that you are talking about lobbying aggressively for tough, strong, and effective highway safety laws. So far how would you say that effort is coming along?

Mr. MAATMAN. I think in terms of what we, as an organization, could take credit for, we haven't been in existence that long to be able to point to specific victories of our own. But certainly the trend across the States over the last couple of years has been encouraging. We have had a good number of States pass mandatory seatbelt laws, and certainly in the drunk driving legislation area we have seen some good progress.

But, nevertheless, as we indicated in our testimony, we think there is more to be done and we see a fairly long agenda—a good number of States in which our further efforts are needed. That is where the Advocates intends to focus a lot of its attention.

Mr. MINETA. Do you think local and State laws are easier to get passed than at the Federal level?

Mr. MAATMAN. In some States.

Mr. MINETA. I am just wondering whether you have better leverage at the local level, especially as it relates to safety.

Ms. CLAYBROOK. Not if you put incentives in there.

Mr. MINETA. Or sanctions?

Ms. CLAYBROOK. Or sanctions. I think that if you do that it really helps. We are very enthusiastic about having the grant program include those kinds of assists.

Mr. MINETA. Is there a trend towards State passage of tougher safety laws?

Ms. CLAYBROOK. I think so. For example, in the motorcycle helmet area, certainly an area of some controversy in the past, there are four States that have passed helmet use laws on their own without any real efforts by the Federal Government at all. California has been passed twice, in fact. As you know, it has been vetoed by the Governor. I believe the next Governor is going to sign it.

Mr. MINETA. Well, the candidates for the governorship—two of them, at least——

Ms. CLAYBROOK. Have indicated that they would sign such a bill. So that is an example. The seatbelt use laws have been passed in 33 States. While a few States have revoked those laws, we think there is general support for them and certainly an enormous increase in safety belt usage. It is up from 12 percent to 48 percent nationwide. That is a very, very encouraging sign.

I think that the issue for us here, Mr. Chairman, is that these laws work. Helmet use laws work. Belt laws work. Child restraint usage laws work. Age 21 for drinking works. These laws, by and large, the public obeys, and it does result in significant lifesaving.

Mr. MINETA. You said that funding for safety programs and research should be increased. In what areas do you think existing safety programs are lacking due to insufficient funds?

Ms. CLAYBROOK. I would certainly say enforcement would be the number one item in my view. This is now in the grant program. With the cutback of the 55 mile an hour speed limit I think there has been a lot of discouragement among State police in this area. In addition, we know that enforcement of these laws that have been saving lives increases lifesaving, particularly when combined with publicity programs. So I would certainly say that.

Secondly, we highlighted the need for increases in research programs. The payoff from the highway safety program, Mr. Chairman, is perhaps one of the highest of any government programs because it is very measurable, and it is measurable because a lot of research is done in advance to determine whether or not these programs work, and then it is evaluated after the laws have been adopted.

So we know a great deal about the payoff from the investment that is made in this area, and I think it is one of the things that the Federal Government could really boast about. In many government programs we have no knowledge of whether or not the funds really are making a difference in the quality of life of people in this country. In these programs we absolutely know that they are saving lives.

Mr. MINETA. Let me ask you about that data base. Do we have a good Federal data base?

Ms. CLAYBROOK. Yes. There is a program called FARS--the Fatal Accident Reporting System—that was set up in 1975. And then there is the national accident sampling system, which was set up at the same time, which is a sample to get more information about the injury area. Then there are some specialized programs that have been set up to do particular evaluation efforts. So there is a good data program, but there needs to be, in my view, more emphasis on evaluation. The capability——

Mr. MINETA. That was the question I was going to ask you. If we have a good data base, are we using it to accurately impact and to improve driver safety? Is there a linkage there or are we just collecting data for the sake of collecting data? Are we impacting on driver safety behavior and standards?

Ms. CLAYBROOK. I think absolutely we are. But I think that with the cuts in this program—you know, the agency has lost a lot of personnel. Since 1981, when I left the agency, to today I think the agency is down from something like 800 people to less than 600, maybe 550. What happens is that the research, particularly the evaluation area, gets strangled in that process. I think that we need to—we are spending now something over $20 million a year in data collection, it seems to me a very modest investment to have an increase in the evaluation staff because they are the ones who can tell us whether or not these programs are working. The agency has put a premium on publication of the evaluation activities that

they have underway, but it seems to me that now, with a data base that is of almost 15 years duration, that we should be putting greater emphasis on evaluation.

Mr. MINETA. Mr. Maatman, later on we will have the president of the Insurance Institute for Highway Safety before us, as well. From your perspective, has industry been doing enough to leverage on their colleagues in the business sector to do more on this safety side?

Mr. MAATMAN. Of course, from our perspective we think we have made some very good contributions in this whole area. On the issue of whether or not we have applied enough leverage on the business community, I suppose the answer to that depends upon where you are standing and looking at the picture.

Especially over the last couple of years, many of the leading companies in our industry have begun to develop good dialogues with the manufacturers in Detroit, and I think some good progress has begun to be made.

But more can be done. There is no question about it. And I think the automobile insurance industry is recognizing the fact that the public expects us to be more than simply a pass-through mechanism shifting the cost of accidents back to the public, and I think you are going to see more and more evidence of the automobile insurance industry taking a very proactive stance on a lot of things. I think this particular coalition, in itself, is evidence of that.

Ms. CLAYBROOK. Mr. Chairman, I would just like to say that Mr. Maatman has been one of the leaders in pushing this industry to do more. If the entire industry did as much as he has done, I would say hallelujah. So he deserves kudos. This industry really has made a big effort to reach out. Of course, the consumers always think that everyone else can do more.

Mr. MINETA. Mr. Packard?

Mr. PACKARD. Thank you very much.

Welcome to the committee, Mr. Maatman.

In California you are aware that there has been a significant effort through the initiative process to reduce the cost of insurance. Certainly as we make progress in terms of safety and reducing——

Mr. MINETA. You are referring to proposition 103? [Laughter.]

Mr. PACKARD. As we make progress in reducing accidents, insurance costs should maybe not come down, but certainly the increases should be slowed. I would be interested in your observations as to what did happen in California and what effect it has upon the industry as it relates to automobile accidents and coverage, and what a better solution may be.

I agree with the chairman, at least from his gestures. I did not support them, but, nevertheless, one out of five or six initiatives did pass that affected insurance rates.

I would appreciate your comments on that if you wouldn't mind.

Mr. MAATMAN. Certainly, to begin with, proposition 103 certainly got the attention of the industry, and it continues to get the attention of our industry. It is indicative of the fact that there is an affordability problem, especially in the more concentrated urban areas of California and some other States. There is no question about it. The cost of automobile insurance for a good portion of the public is frightfully high—we would say justifiably so because of

the accident experience in urban areas, but the fact does remain that we have gotten to the point in many urban areas where it has become unaffordable for people, and especially people on the lower part of the economic scale.

Our industry, of course, feels that proposition 103 is the wrong way to go at the problem. It is going to take some period of time—and most of it I am afraid is going to have to be settled in the courts in terms of attempting to use the approach that 103 has chosen to use.

The fact that our industry has joined in this coalition—the Advocates for Highway and Auto Safety—I think is indicative of the fact that we think this is one of the best ways to begin to do something about the high cost of auto insurance, and that is to reduce the frequency of accidents and, equally important, the severity of them.

This, along with taking other kinds of loss costs out of the system through other means such as a good, effective automobile no-fault plan and things of this nature doing a better job of controlling medical care costs, we think represents the only rational way to get at this problem.

Unfortunately, the solutions to the affordability problem in California and some other places are going to take some time to take hold. Certainly with this approach of attempting to reduce the frequency and severity of accidents you are not going to have any great relief overnight from using that kind of a remedy. The fact remains, we think, over the long run, that is the best way to tackle it.

Mr. PACKARD. Ms. Claybrook, would you respond also to the question regarding the effect of making the 55 mile speed limit optional to States on certain rural interstates?

Ms. CLAYBROOK. First let me say that if you look at the premium dollar, approximately two-thirds of it is the result of pay-outs for property damage and personal injury. It is about 39 percent for property damage and the rest for personal injury.

If you can significantly reduce the losses from property damage and personal injury, then you can reduce or control insurance costs much more effectively.

Mr. Maatman is exactly right: it does take time. You have to make an investment up front to get these programs in place, but they have a very high payoff.

With air bags coming into many cars in the next decade, I think we are going to see a significant reduction in death and injury, along with the other State law programs that we have already mentioned today.

In addition, our coalition is working on theft reduction and on other kinds of controls for property damage.

So we hope that these efforts will reduce some of the disagreements and tensions between consumers and insurers by attacking the problem in the most effective way for the long term, but it is a long-term issue.

In terms of the 55 mile an hour speed limit, the Department of Transportation has found that there is about a 20 percent increase in the number of deaths on the rural interstate highways that have

adopted the 65 mile an hour speed limit compared to a 55 mile an hour highway. It has made a difference.

The National Academy of Sciences did a study in 1986 that evaluated this option, and they estimated approximately this amount of increase in death and injury. I have to say it is the only program I know that has been adopted in the last 25 years that increases death and injury on the highway. I find it very sad. My view is that people are always going to exceed the speed limit—probably by 5, 6, or 7 miles an hour. It is better to have it a little bit lower so when they exceed it they are not going so fast. There is also a spill-over effect on 55 mile an hour highways when they are coming off of 65 mile an hour highways.

We advocate a return to 55 miles an hour.

Mr. PACKARD. I have one last question, if I may, Mr. Chairman.

Mr. Maatman, California was used as an example in one of our hearings—I don't know whether it was in this committee or not—regarding the capping of some of the pain and suffering legal judgments. It was at a medical meeting that I attended. They used California as an example that other States could follow in terms of changing the law in terms of judgments rendered in terms of accidents in terms of pain and suffering. Has that affected insurance rates in California compared to other States that do not have these changes?

Mr. MAATMAN. First of all, I don't think we would point to California as being one of the sterling examples of having put an effective cap on it. New York, for example, I think has done a better job of that. A lot of people point to Michigan as another example.

We happen to think that caps on what is recoverable for pain and suffering can definitely have an impact on insurance rates over the long run. The fact remains that in a lot of States that do have no-fault systems, first of all, they have a very low threshold which permits law suits to be filed in any case and a very high percentage of cases. That is a lot of the problem. The no-fault systems aren't too effective in reducing that down.

Mr. PACKARD. Thank you very, very much.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Valentine?

Mr. VALENTINE. Thank you, Mr. Chairman. I apologize for getting here so late. I was going to step in and ask some questions about the radar detector and that sort of thing, but my chairman tells me that you have addressed some of those matters. So my question might re-plow some territory, but I will be brief and I apologize in advance.

The prepared statement that I have indicates that when the speed limit was raised from 55 miles an hour, which I think was a tragic mistake——

Ms. CLAYBROOK. We agree.

Mr. VALENTINE [continuing]. The people in the Congress and elsewhere who say that speed doesn't kill—I think it is the difference between tossing a bullet and shooting a bullet. Do you have any figures to go with the 25,000 lives lost indicating the increase in the severity of the injuries sustained by people because of those extra miles? I am interested not just in percentages, but in figures like this 25,000.

Ms. CLAYBROOK. Well, the number of deaths that the Department of Transportation has indicated I believe amounts to about 350. Now, this is with 65 mile an hour speed limit just on the rural interstate highways, and nine States haven't adopted that. It is in about 40 States.

In terms of the number of injuries, I don't have a number. We would be glad to see if there is one and submit it for the record.

By and large, a rough calculation, based on my experience, is that you could multiply the number of deaths by about 20 to get the number of severe injuries. That is just a rough calculation. But we would be glad to see if the Department of Transportation has done this.

It is much harder to collect injury statistics because many crashes are never investigated and the fatality data comes from coroners and so on. It is much harder to get the injury statistics, but we would be glad to see if there is anything.

[The information to be supplied follows:]

RESPONSE TO QUESTION FROM MR. VALENTINE:

As one example of the strained resources at NHTSA, the agency itself does not have the ability to keep a data system on motor vehicle injuries to the degree that we could firmly document the impact of the increase in the speed limit from 55 mph to 65 mph on the number and/or severity of motor vehicle injuries, though such injuries cost our society billions of dollars. Such data would be an extremely valuable tool, as we know from the knowledge we already derive from the Fatal Accident Reporting System (FARS).

In one April 1989 study looking at the impact of the 65 mph speed limit in Alabama, the researchers found that there was an increase of approximately 18 percent in the accident frequency in all classes of accidents -- fatal, injury, or solely property damage when comparing the same roadways at 55 mph and after the limit was increased to 65 mph. Significant increases in property-damage and injury accidents were found for all interstate roadways (the 65 mph and 55 mph interstates combined). In comparing the test areas (Interstate highways on which the speed limit had been raised to 65 mph) against the rest of the state, both property damage and injury accidents were significantly higher in the test area than for the rest of the state.[1]

I have not located any other studies which provide a better analysis of injury rate and severity in correlation with the 65 mph increase than this, and I realize that the study cited above does not

---

[1]"The Safety Impact of the 65 mph Speed Limit: A Case Study Using Alabama Accident Records," Brown, Maghsoodlo, McArdle, Auburn University, through U.S. DOT, April 1989, p. 75.

directly answer your question. Such a lack of data strongly indicates the need for additional Federal research and demonstration funding for the highway safety field.

Mr. VALENTINE. As to these radar protectors here. I was just going to ask you about that word.

Ms. CLAYBROOK. It should be "detectors."

Mr. VALENTINE. Do you know of any use to which those contraptions can be put except to help people violate the laws of this country?

Ms. CLAYBROOK. No.

Mr. VALENTINE. Do you have an opinion? I know this is probably a political question, but do you have any opinion based on your interests as to whether or not a constituency has built up in this country to the extent that we might be able to do something about this scourge?

Ms. CLAYBROOK. Well, we certainly support banning of radar detectors. There is a constituency on the other side among the manufacturers who manufacture them. I think that there is not a strong constituency that has built up on our side across the nation. I do think that the insurers have played an important role.

Right now, for example, GEICO Insurance has asked the Maryland Insurance Commissioner and our organization and the National Safety Council—others have supported them in amicus briefs—has asked to be able to refuse to sell insurance to any person that owns a radar detector. I think that is a great idea. We lost at the Insurance Commissioner level. We took it to the court. We lost in the court. There is a consideration about appealing.

There is also a case now that is being considered in the State of California.

We are pursuing this. I think that is one way that we can do it individually and independently.

Mr. VALENTINE. I seem to see more of the advertisements in airplanes than anywhere else. I don't know whether there is a lesson in there or not about safety. If you pick up the magazine furnished by United Airlines—I wrote to them some years ago. They kind of thought it was amusing. I asked them about advertising and about having the name of that airline on a publication that advertised machines, the only purpose of which was to help people violate the law. The strange thing is that I—and I am one of what they call the "tobacco boys" around here. We go down there every year and talk to Mr. Waxman when he wants to outlaw advertising of certain legal products and we fan through that magazine and show him the automobiles that advertise they can be—of course, foreign cars, I guess—accelerated from a stopped position to 75 miles an hour, an illegal speed. They advertise other commodities that don't have any warnings on them there. I always bring out these little detectors.

Ms. CLAYBROOK. Well, I think it is outrageous.

Mr. VALENTINE. I do, too.

Ms. CLAYBROOK. In fact, Nissan Motor Company had an ad that they put on the Superbowl that showed one of their cars could—and it was compared to an airplane that goes about 700 miles an hour. The Insurance Institute for Highway Safety and all the safety groups objected violently and made a big stink with CBS and tried to not have them run it. We didn't succeed, but it turns out they have announced now they are not going to run that ad again.

But I think we have to be bolder and more aggressive about tackling these unsafe ads. It is something we are starting to talk about inside of Advocates. While I can't make any commitment because we haven't drawn up a program yet, I certainly think that we agree very strongly that these kinds of ads are very misleading to the public.

Mr. VALENTINE. If you have any additional thoughts that might be illuminating, write to me or come by to see me some time.

Ms. CLAYBROOK. Okay. I would love to do that.

Mr. VALENTINE. The world is turned upside down.

One more question, Mr. Chairman.

How many States outlaw these devices?

Ms. STONE. Two States and the District of Columbia. The States are Connecticut and the State of Virginia.

Mr. VALENTINE. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Shuster?

Mr. SHUSTER. Thank you, Mr. Chairman.

I certainly welcome you here today. I'm still not sure whether my friend over here is advocating for or against banning the advertising of dangerous products. Or is it just some dangerous products? [Laughter.]

Mr. VALENTINE. Products that allow you to violate the law or do illegal things.

Mr. SHUSTER. I see. We could pass some laws that make things illegal that ought to be illegal, and I would be for that. [Laughter.]

Mr. SHUSTER. That's a different subject.

Mr. VALENTINE. We can, indeed. And if we did that, our attitude, it should be different.

Mr. SHUSTER. Right. I thank my friend.

Joan, you lost me on one statistic. When you referred to highway deaths, cancer, and heart disease, I thought you said there were 4.1 million highway deaths——

Ms. CLAYBROOK. Years of life lost.

Mr. SHUSTER. Okay.

Ms. CLAYBROOK. It is because the people who are killed in auto crashes are young.

Mr. SHUSTER. I've got you.

Ms. CLAYBROOK. They have many, many more years of life lost based on average lost.

Mr. SHUSTER. I've got you. Thank you.

With regard to seatbelts and the various safety programs and the 65 mile an hour speed limit, I was opposed to increasing the speed limit from 55 to 65, but when it looked to me like we were going to lose I tried to persuade my colleagues on the House side that there was a compromise which we should offer, which was to tie any 65 mile an hour speed limit to a tough seatbelt law in the State and say, "If you are going to go to 65, you have to have a tough seatbelt law." I couldn't sell that to my colleagues, and so we lost everything.

My question is: would you see that as a reasonable compromise? I think it is going to be awfully tough, once you pass a law in setting it to 65, to roll that back to 55. What would your feeling be about a compromise that said if you are going to have 65 you have to have a tough seatbelt law?

Ms. CLAYBROOK. Well, I have great faith, Mr. Shuster, in your legislative ability. [Laughter.]

Ms. CLAYBROOK. If I were going to ask you to do anything, it would be to tie a highway funding penalty to a 65 mile an hour speed limit and then we might see the States behave differently. Failing that, I would certainly like to see safety requirements tied to it. But I guess it is very difficult for us to support any reduction in safety on the highway.

Mr. SHUSTER. Which is more important, the 65 mile an hour speed limit or a seatbelt law?

Ms. CLAYBROOK. I think that the number of lives saved by seatbelts overall is larger than the number of lives lost by a 65 mile an hour speed limit.

Mr. SHUSTER. That is my sense of it, as well.

I have no further questions. Thank you very much.

Ms. CLAYBROOK. Thank you.

Have you gotten an air bag car yet?

Mr. SHUSTER. No, I haven't. But I have ridden in one.

Mr. MINETA. Well, Mr. Maatman and Ms. Claybrook——

Mr. SHUSTER. With my seatbelt on.

Mr. MINETA. Thank you very, very much for your testimony and, again, for all of your efforts on behalf of highway safety.

Ms. CLAYBROOK. And thank you for yours, Mr. Chairman.

Mr. MAATMAN. Thank you, Mr. Chairman.

Mr. MINETA. Take good care of Carol Stroebel.

Ms. STONE. Absolutely. It is a gain for safety, Mr. Chairman.

[Mr. Maatman's and Ms. Claybrook's prepared statement appears on page 1436.]

Mr. MINETA. I would like to now call on Mr. Henry Jasny, Senior Attorney, Center for Auto Safety; accompanied by Doctor Gerald Donaldson, Associate Director for Highway Safety.

Your statement will be made a part of the record. Let me call on you, Henry, to proceed in your own fashion.

TESTIMONY OF HENRY JASNY, SENIOR ATTORNEY, CENTER FOR AUTO SAFETY, ACCOMPANIED BY GERALD DONALDSON, ASSOCIATE DIRECTOR FOR HIGHWAY SAFETY

Mr. JASNY. Thank you, Mr. Chairman. Good afternoon.

My name is Henry Jasny. I am the senior attorney at the Center, where I work exclusively in highway safety. The Center is a not-for-profit, public interest, consumer advocate organization dedicated to reducing losses on our nation's streets and highways because of unsafe motor vehicle and highway designs.

I am accompanied today by Doctor Gerald Donaldson, our associate director for highway safety, who is here to help answer any questions you may have regarding our ideas for an improved Federal highway program.

Mr. Chairman, America's highway program is in serious trouble, with more threats launched against it today than ever before and a crisis in funding for the future that must be overcome by rapid, assertive action by our Congress.

We believe that this reauthorization legislation will determine much of the quality of life in this country into the next century.

This is no time to cripple our transportation system with short-term gains in deficit reduction by mugging the Highway Trust Fund, nor to continue practicing bookkeeping sleight of hand which holds our money hostage.

Two weeks ago today you were presented with a short-sighted vision of our nation's highway program that radically reduces Federal leadership in achieving improved safety, mobility, and economic health for America. You heard a proposal to dump large areas of the existing highway program into the laps of the States, counties, and cities, with either much lower or no Federal funding.

Where will the money come from to assure the improvement and maintenance of these orphaned highways, streets, and bridges? It is well known that improvements in materials and design naturally produce more efficient, as well as safer, highway operations. How will this come about if funding is supposed to issue from each State legislature where road funds often compete directly for general revenues with other, non-transportation programs? How will fragmentation of our highway program produce the increasing design uniformity that lowers the chances for accidents?

Cutting our Federal program to so-called systems of national significance is a retreat in the face of an even greater need than ever before for enhanced safety and mobility and transportation-based prosperity.

The Center believes that there are defensible national goals and needs that rise all the way from a county major collector route that is a lifeline for farmers and coal trucks, through an urban artery that is essential for the distribution of goods, up to an interstate highway with 100,000 vehicles a day. These national goals of safety, mobility, and economic well-being can be assured only through increased Federal funding and Federal leadership.

As you appropriately expressed in your remarks of March 8 which opened the consideration of this watershed reauthorization bill, our transportation system must not be regarded as a collection of individualized concerns, but as a national program with overarching goals that are wisely managed by innovative leadership. "How we spend trust fund monies is as important—if not more important—than how much money we spend."

In his testimony before this committee on March 8, Secretary Skinner also stressed sound infrastructure management programs. He proposed that management programs become a condition for Federal aid because the States have not spent, in his words, these "free" Federal dollars as wisely or as carefully as State and local funds.

We agree with this wholeheartedly, Mr. Chairman, and, in response, we are submitting to you today a highly-detailed package of management initiatives which address the core program areas of the Federal Aid Highway Act. These comprehensive management proposals integrate many diverse provisions scattered throughout the current statute into major, cohesive programs for pavement, interstate 4R work, highway safety, bridges, and maintenance.

In each instance, the States would have to adopt appropriate management systems approved by the Secretary in order to receive Federal funds.

In addition, we have also addressed specific, critical problems of highway safety that need special emphasis in their own new programs. One of these is a national effort to reduce the horrifying rate of losses we have begun to incur because of the 65 mile an hour speed limit on rural interstate highways. We call this the interstate safety emphasis program, a national effort which will systematically improve geometric design, traffic control devices, safety equipment, and pavement markings so that the highway environment is safer for drivers of all ages and capabilities.

The other safety emphasis area we propose is the work zone safety program, which is aimed squarely at reducing the unacceptable losses in highway work zones. Last year, Mr. Chairman, America suffered nearly an 8 percent increase in work zone fatalities, and the Federal Highway Administration's response to this leap in deaths has been to dismantle what little regulatory and reporting machinery that existed.

Apart from these two targeted areas of safety, we also propose other amendments that, in concert with the preceding programs that I have referred to, will address the needs of elderly and handicapped drivers who need special help on the road. America's aging pyramid is being rapidly squared, and it is time to meet the requirements of older drivers and drivers with diminished capabilities.

We are convinced, Mr. Chairman, that our detailed legislative recommendations are the kind of brainstorming this Congress must engage in so that the transportation policy leadership this country so desperately needs and deserves will emerge over the next year and a half. Congress needs a forward-looking blueprint for reinvigorating our national highway program.

Expanded, comprehensive safety policies and a systematic management approach to program expenditures must be keystones of the next highway bill. It will require hard work among you and your colleagues, with the input of the private transportation community, to forge the necessary changes.

Although we are a very small organization, our freedom to serve the public interest unreservedly places us in a unique position to help our country's transportation program to achieve new levels of safety, economic benefits, and personal mobility. We stand ready to assist you in whatever way we can in the drafting of an innovative, responsive legislative document that will secure these goals.

We appreciate this opportunity to convey our views and our proposals to the committee, Mr. Chairman, and we ask that the text of my statement and our accompanying legislative proposals be made a part of the hearing record. We are prepared to answer any questions you have.

Thank you.

Mr. MINETA. Thank you very much, Mr. Jasny. Without objection, your total statement will be made a part of the record.

Mr. Jasny, I am a very strong proponent of highway safety. I believe that highway safety has to be a centerpiece of any Federal aid highway program including roadway design features. Highway safety is one of the many areas that will need to be addressed in the highway reauthorization process, including: congestion, a dete-

riorating transportation infrastructure, and geographically different transportation needs and priorities.

If one theme has been pervasive in testimony before this subcommittee, it is that any new Federal highway program should provide States flexibility in meeting their own individual transportation needs in this new, post-interstate era. This is particularly true now that congestion and lack of revenue are taking their toll—that's a pun.

What I am interested in learning is: how do we provide this flexibility and, at the same time, ensure that all highways are properly maintained or rehabilitated in order to provide the safest driving environment possible? In your management initiatives package you make several proposals. Individually they are good. They would retain Federal authority over safety standards, some of which, however, may fly in the face of a more flexible approach to the current Federal aid program.

If the Congress were to adopt your proposal, how might they be tailored to accomplish their goals and, at the same time, still allow for flexibility in State and local management policies?

Secondly, is it possible to develop a balanced highway transportation program that does, indeed, provide State flexibility and still assures uniform national safety standards?

Mr. JASNY. Mr. Chairman, if I may start with response to your questions, we don't view the goals of safety to be incompatible with flexibility. What we are requesting and what we think is necessary to the future of this country's infrastructure and highways is that there be minimal goals for safety and minimal expenditures for safety programs, and that there be a requirement for management structures that are up to date and modern. Many States have inadequate 19th century management techniques that have to be done away with.

We do not view the idea of State flexibility in terms of expenditures as allowing or calling for unsafe practices or mismanaged programs. We believe that it is the requirement of adequate Federal oversight of the program that the Federal Highway Administration and the Department of Transportation set basic standards that the States have to meet.

As you may notice in our package of proposals on management, we don't request the Federal Government to set out specific materials standards such as what quality for guardrail, or what construction work will be done. What we are requesting is a procedure and a process that will take into account sophisticated management techniques. Beyond that, the State will have flexibility in terms of the expenditures so long as they can meet the requirements of those programs.

Mr. DONALDSON. May I add to that, Mr. Chairman?

Mr. MINETA. Absolutely, Doctor.

Mr. DONALDSON. Flexibility is inherent to the very notion of the management initiatives that we have offered for the committee's consideration. What we are trying to do is two things simultaneously, Mr. Chairman: first of all, to reinstate Federal leadership in the Federal Highway Administration. We think the very best way to do that is to take broad program areas in the Federal Aid Highway Act, require the agency to install certain coherent, ration-

al management methods, and then to allow an adaptation of those models for each State's needs. There should be a very wide adaptability on the part of each State to fulfilling those management models.

We believe in certain critical areas of safety that certain design and performance standards have to be unexceptionable from State to State. We think that certain design standards regarding safety appurtenances, pavement skid resistance, and things of that sort have to have certain indexes which are relatively inflexible.

But in terms of how a State carries out its management program in accordance with a Federal model, we think that there is an appropriate balance that can be struck between the Federal stewardship role, on the one hand, and the degree to which a State must, by necessity, adapt that Federal management model to its own unique needs.

Mr. MINETA. One of the things that I—again, I am brand new to the subject matter, and Congressman Shuster has been a leader in this whole area of surface transportation. One of the things that strikes me, frankly, is in two areas: one is maintenance. We are good at capital improvement. States are really responsible for maintenance, and yet there hasn't been the maintenance program carried on at the State level; consequently, they come back in a short period of time with a tin cup and say they need more money to do some work.

I wonder whether or not, under this new reauthorization, we shouldn't have some kind of maintenance management practices that are going to be mandated so that we—it seems to me we have a certain design life when these things are designed, and yet States come back to us before the design life and say they need some help on this.

The other area is—and it is tied in to that—the area of an inspection program at the time of the construction. I am not sure that we are getting a ten-sack concrete job. We may be getting a seven-sack concrete job, but I don't know that. Maybe we have got to be doing, as part of this, not only a management program as it relates to maintenance, but also in terms of inspection at the time of construction.

Mr. DONALDSON. Well, you are preaching to the choir, here, Mr. Chairman.

Mr. MINETA. I am quite certain.

Mr. DONALDSON. We agree with you 100 percent. Unfortunately, the story—and I could tell it to you in chapter and verse here today, item by item, of why and how we have reached a state of such sorry maintenance on the Federal aid systems, why it has gotten the way it has over the last quarter of a century, at least.

Unfortunately, some of the blame has to be placed on how the 3R program was both conceived and implemented. Other parts of it are inadequate revenue and a lack of any coherent maintenance program in most of the States.

But the sum total is that we do have an enormous capital investment out there which affects not only physical integrity but also mobility and safety, and all three of those basic targets for the Federal aid highway program are highly compromised as long as we don't have adequate maintenance management.

You noticed probably in our initiatives that we don't ask specifically or immediately for maintenance management standards to be implemented because at the moment we basically don't know what those should be. But we do call for a concerted study by the National Academy of Sciences to come up with what kind of reasonable maintenance performance goals should be used under Federal stewardship to make certain that the States protect and enhance that capital investment that has taken so many years and so much money to make.

Mr. MINETA. We have also had testimony presented to us that indicates that construction of highway facilities costs considerably more as a result of Federal regulations and bureaucratic red tape than they would have cost had the States been able to develop their own standards. How would you respond to this in terms of Federal authority over highway safety design and performance standards—especially since you are talking about geometric design in terms of this ISEP program.

Mr. DONALDSON. Well, first of all I would respond, Mr. Chairman, by saying that most of the claims that there is excessive regulation is a red herring. I believe that, in fact, if you look at the record, you will see that the overwhelming preponderance of all the design standards that we have were generated by the States through their interest organization, the American Association of State Highway and Transportation Officials. Virtually no emendation of the standards produced by that organization is done by the Federal Highway Administration. They are almost always received as an accomplished fact. They are put through a rather formal Federal Register system of notice and comment rulemaking, and then they are put into the corpus of Federal regulations.

So the issue of the States not basically determining for themselves what they think are the most reasonable design principles for both safety appurtenances and geometric design alignment and cross section is certainly not the case. It has been a traditional Federal/State relationship that has functioned that way now for many decades.

Mr. MINETA. All right.

Mr. Shuster?

Mr. SHUSTER. Thank you.

We certainly appreciate your testimony. I am very sympathetic to many of the things you are proposing. While I guess in some areas I believe in States' rights, in transportation that is not necessarily one of them. I think standards are enormously important for us to set. One of the beauties of the interstate system is that you can get on it in California or Missouri or Pennsylvania or wherever and you know it is going to be built to certain specifications. I am wondering if we were to identify what some might call a national highway system—which, of course, would begin with the interstate and then add to it another 100,000 miles, or whatever it might be—and, in effect, have not necessarily the same kinds of standards that we built the interstate to, but standards, does that idea make sense?

Mr. DONALDSON. It certainly does. My problem is that behind what is most of the good in that idea is a little bit of the bad. The good part is, of course, that we take what probably would be most

of the major arterials in the U.S. primary system and make them pull themselves up by their bootstraps and, in some instances, try to recreate them as limited access or virtually limited access facilities, improve their exit and egress ramp geometry, improve alignment and cross sections, skid resistance, extend shoulders, and all those kinds of things. All those things are very good.

The bad thing for me, as a safety advocate, Mr. Shuster, is the fact that if that went up to the 120,000-, 140,000-, or 160,000-mile map that some people have thrown around in recent weeks, to me that is a sitting duck waiting for certain interests to come in to exploit that, for example, as a priority commercial network.

I don't see anything bad about that in terms of improving truck safety because I would like to see better truck safety. But I am also concerned that we have—as we got the tandems in the early 1980s, I am concerned that we now have the turnpike doubles and the triples waiting in the wings. If we improve this system, then it seems to me to be ripe for someone to come up and argue that we should now have these bigger rigs being able to run on many more miles of the Federal system.

Mr. SHUSTER. But how do we get around that? If I hear you right, that is an argument that says we shouldn't improve something because it is going to get more and heavier use. If you follow that logic to its conclusion, then we ought to go back to dirt roads.

Mr. DONALDSON. No. In fact, I am not advocating that this shouldn't ultimately occur. I am saying that we are raising the ante.

Mr. SHUSTER. You are saying we will have to be careful that we——

Mr. DONALDSON. We have to be very careful about——

Mr. SHUSTER [continuing]. We only permit that which——

Mr. DONALDSON [continuing]. How we are going to control it.

Mr. SHUSTER [continuing]. Is safe to occur.

Mr. DONALDSON. Yes, sir.

Mr. SHUSTER. That is all the questions I have. Thank you very much.

Mr. MINETA. Let me, if I might—I wonder if you would be able to summarize ways in which the current Federal standards are considered ineffective in achieving an optimal highway safety environment.

Mr. DONALDSON. Oh boy. In 50 words or less on the back of a Rice Krispies boxtop the way we used to do as kids. That is a hard one. If the summary runs too long, stop me.

Basically, what is wrong with our Federal design standards now for highways is that we have taken what were once fairly reasonable values and we have benchmarked them down at minimums that are so low that for all practical purposes it would be almost impossible to build a highway nowadays without being able to meet those standards.

One of the things in point most recently was the interstate design standards which went through rulemaking. Indeed, the eight-page document that emerged, in my opinion, was a document which does not fulfill anything close to what we need in terms of the design integrity for those highways, not only in terms of reconstructed design, but even for 3R design.

Mr. MINETA. Let me ask a question on that point. If we put more money into IVHS are there benefits that will come from that? Or is the technology already there to do some of these things and we ought to just get on with the job?

Mr. DONALDSON. We know how to make highways safer. We know how to build them safer. We generally know, particularly on the interstate system, what the preferred design values are. The basic character of what emerged in the recent interstate design standards was a political and economic statement, not a statement of what engineers know to be the best way to build an interstate. They know how to do it.

Smart vehicles and smart highways may be a potential in the future, but in the short-term I think that we have to enter a post-interstate construction era by asking the States now to show how they are going to systematically and—as Mr. Shuster was pointing out—uniformly raise overall design to a level where we can be sure that when you travel from State to State that you are going to get an environment which doesn't violate driver expectancies. The driver sees the same thing in Pennsylvania that he sees in Ohio and Nevada.

Mr. MINETA. Do you think that FHWA in certain cases has adopted a policy of permitting Federal funds to be used to purchase highway safety equipment which may not have been deemed to be crashworthy or to meet performance standards?

Mr. DONALDSON. Yes, there are quite a number of instances where inferior or unacceptable installations have continued to be put in place. That varies considerably according to the geography you are dealing with, Mr. Chairman, and it has to do with the fact that a great deal of discretion resides in a division administrator's office. The fact of the matter is that some divisions are more pliable than others, and so you will go in some States where certain installations are certainly not accepted as kosher, and in other States you will find them there.

Mr. MINETA. This last week I spoke to the American Traffic Safety Services Association.

Mr. DONALDSON. Yes. I am just trying to convert from that trip yesterday, myself.

Mr. MINETA. In preparing for that I had a memorandum that came out of the Federal Highway Administration. I believe it was dated December of 1989. As I was flying out I was reading this memorandum.

On page one it talks about this very thing you are talking about—the 8 percent increase in work zone fatalities.

Mr. DONALDSON. Yes.

Mr. MINETA. And then on page two it says they are going to do away with the division reports that require the States to keep reporting this. And so during my speech I interjected this anomaly. Immediately I was tackled by Gene McCormick, the deputy administrator of the Federal Highway——

Mr. DONALDSON. The anecdote reached my ears, Mr. Chairman.

Mr. MINETA [continuing]. Administration who then said, "No, no. That report was poorly written. It really wasn't intended that way. What we are saying now is that those reports, instead of coming to

FHWA central will be going to the regional offices." And I said, "But here it says that you are not going to be using these reports."

It just doesn't make any sense, and I intend to follow up on that.

Mr. DONALDSON. I hope you do, because we are still dismayed at trying to keep down the work zone safety countermeasures at a regional level because we believe that work zone safety needs a national approach. We think it needs uniformity. This kind of increased fragmentation of stewardship isn't going to help save any lives.

Mr. MINETA. The rationale was that it was to cut down on the paperwork.

Mr. DONALDSON. Well, I don't like taking a paperwork approach as the first approach.

Mr. MINETA. But when I see increases in work zone fatalities, not only as an absolute number, but the rate is increasing in terms of the contracts let—and that is the standard that has been used—it just didn't make any sense at all.

Mr. Shuster?

Mr. SHUSTER. With regard to Federal highways, Tom Larson is now the administrator. In eight years in Pennsylvania as the Secretary of Transportation he took what was considered by many—not only in Pennsylvania, but elsewhere—as one of the worst highway departments in America and turned it into one of the best. I would be interested in your evaluation of Doctor Larson's—not what he has accomplished, because he has only been there for several months, but the potential of what you think can be accomplished.

Mr. DONALDSON. A particularly interesting question, Mr. Shuster, because I think that Tom Larson has the potential to be one of the greatest Federal Highway administrators in the history of the agency.

He certainly did to—I have to disagree with you, as impolite as it may sound. I do not believe that Pennsylvania even then was the worst highway department in the United States.

Mr. SHUSTER. I said one of the worst.

Mr. DONALDSON. One of the worst. I think Tom Larson did a stupendous job. I followed it closely. I have worked with him and served with him on committees. He is a brilliant man. He is an unusual combination of a man that has academic excellence and management excellence. I see good things in the offing if he can get strong support.

Mr. SHUSTER. Of course, that is one of the reasons we are up here—to try to give some support.

Thank you very much.

Mr. MINETA. Well, thank you very, very much Mr. Jasny and Doctor Donaldson. You center has been really a cutting edge in terms of what has to be done in terms of safety, and we very, very much appreciate the work that you do given, frankly, the small nature of your organization. You are highly visible and the work is very effective. I want to thank you for what you do.

Mr. DONALDSON. Thank you.

Mr. JASNY. Thank you, Mr. Chairman.

[Mr. Jasny's prepared statement appears on page 1421.]

Mr. MINETA. I would like to now call on the President of the Insurance Institute for Highway Safety, Mr. Brian O'Neill.

Mr. O'Neill, we are pleased to have you here. Your statement will be made a part of the record. Please proceed in your own fashion, sir.

TESTIMONY OF BRIAN O'NEILL, PRESIDENT, INSURANCE INSTITUTE FOR HIGHWAY SAFETY

Mr. O'NEILL. Thank you, Mr. Chairman.

What I would like to do, in the interest of time, is just summarize the main points of my testimony.

What I want to focus on today at the subcommittee's request is highway safety issues but with special emphasis on speed and speed monitoring programs.

When speed limits were being raised from 55 to 65 miles an hour on rural interstate highways, proponents of this action said that motorists had been so frequently exceeding 55 that we had become a nation of lawbreakers and that 65 would correct this situation. Proponents of 65 argued that motorists had already chosen the speeds they felt safe and comfortable driving, so there wouldn't be any negative consequences of raising the speed limits.

We now have nearly three years of data about the effects of raising speed limits to 65. What we have found is that many motorists are driving faster now and that the higher speed limits are being routinely exceeded, just like 55 was being routinely exceeded.

What I would like to do is show the first chart, which is from the Institute's most recent survey of travel speeds involving about 37,000 vehicles traveling freely on rural interstates in 11 eastern States during late 1989 and early 1990. Six of these States—Connecticut, Maryland, Massachusetts, New Jersey, New York, and Pennsylvania—still have 55 mile an hour maximum speed limits posted on their rural interstates, and five—New Hampshire, Ohio, Vermont, Virginia, and West Virginia—have adopted 65 miles an hour.

What the survey shows is that the percentage of cars exceeding 70 miles per hour is much lower in the States with the lower speed limits. For example, 10 percent of cars on Pennsylvania's rural interstates where speed limits are still 55 exceed 70 miles per hour, where nearly three times that proportion are exceeding 70 in Ohio where the speed limit has been raised to 65.

Some proponents of higher speed limits point to data suggesting or indicating that average travel speeds have increased only slightly since speed limits were raised, but we at the Institute believe it is much more appropriate to focus on the increasing proportion of cars traveling at excessive speeds—70 miles per hour and faster—because this is the source of most of the increased risk from higher travel speeds.

Deaths increased 34 percent in 1988 on the rural interstates posted at 65 compared with deaths on the same roads during 1982 through 1986 when the speed limits were 55. Deaths increased only 4 percent during the same time period on roads other than rural interstates in the same States. Now, some of these increases occurred because of increased travel and possibly other factors, but

studies by the U.S. Department of Transportation, as well as by the Institute, Harvard, and other respected research organizations, estimate that the increase in deaths on rural interstates during 1988 that can be attributed to the higher speed limits is somewhere between 20 and 30 percent.

We estimate the 65 mile per hour speed limits have caused more than 700 additional deaths on rural interstates during 1987 and 1988 in the States that adopted those higher speed limits.

It is clear that we need to do something to control excessive travel speeds. The question is: what would work to accomplish this? We encourage the Federal Government to set compliance requirements for States to enforce whatever speed limits are in effect.

The compliance formula that is now under consideration would require collecting data on the percentage of vehicles exceeding specified speed thresholds on different road types. For each road type the percentages of vehicles in each speed category would be weighted. Faster speeds on 55 mile per hour non-interstates would get the most weight because high-speed travel on these roads is particularly hazardous, while going a few miles an hour faster than the speed limit on 55 mile per hour interstates would get the least weight. Such a formula would thus appropriately reflect different levels of speed violations on different road types in relation to the safety involved.

It is being proposed that each State's compliance core would be obtained by taking the weighted results for each road type and combining them to reflect the mix of mileage traveled on each kind of road within a State. A State's score would then be compared against the baseline score for the same State in order to determine compliance.

Compliance data would be gathered in each State during fiscal year 1990. From the State data, a baseline score would be established and, in subsequent years, each State would be allowed 110 percent of its baseline score before Federal aid highway funds would be reduced.

The problem is that this plan could tempt States to abandon speed enforcement during the baseline year, inviting, in effect, a year of lawlessness so that compliance in subsequent years would be much easier to achieve. We believe the way to solve this problem is to establish a compliance formula that uses national rather than State averages for the miles traveled on different roads. This way compliance could be assessed among the States—something that is not possible under the proposed plan.

Using a national formula to standardize for road mix would also avoid States where much of the mileage traveled is on congested roads with limited opportunities for speeding being favored.

But clearly, whatever compliance formula is ultimately adopted, it should be heavily weighted towards drivers going faster than 70 miles per hour because these are the riskiest drivers. They are exceeding the design speeds of most U.S. rural interstate highways, and the design speed is one that should not be exceeded even under the most favorable conditions.

Mr. Chairman, now that high-speed driving has increased on so many U.S. roads, it may be difficult and a long-term process to put the cork back on the speed bottle. Enforcing speed limits will help.

In fact, we believe it is essential. But we have also got to look for other ways to prevent high- speed crashes from resulting in highway deaths and injuries.

We have got to implement measures to increase safety belt use, for example. Right now use is generally at or below 50 percent, even in the States where safety belt laws are on the books. Part of the problem here is that so many U.S. safety belt laws provide only for so-called secondary enforcement, which limits police authority to stop and ticket motorists for failure to buckle up.

Of the 33 belt laws now in effect in the United States only 7 provide for primary enforcement, which means police may issue tickets solely for failing to use belts. In the other 26 States and the District of Columbia where primary enforcement isn't allowed, police have to stop motorists for other violations before they can enforce the safety belt law. Clearly we need more primary laws.

We need to develop programs to compensate for the increased loss of life that is occurring because of the faster travel. Our collective conscience still hasn't yet grasped that driving at high speed is an unacceptable risk—a risk in the same league as drinking and driving. Both cost lives. Both are against the law. Both are subject to uniform legal limits. Yet, driving while impaired is treated as a serious problem, while speeding is all too often thought of as okay if you can get away with it.

So while we are trying to come up with a fair and effective speed compliance formula for the States, let's also remember this: speeding, like impaired driving, ought to be unacceptable, not just under the law but according to social mores.

Mr. Chairman, I would be happy to take any questions you might have.

Mr. MINETA. Thank you very, very much Mr. O'Neill.

The Transportation Research Board in its study, "Fifty-five: a Decade of Experience," reported that one risk factor in speed limits over 55 related to the speed differential that was seen prior to enactment of the 55 mile per hour national maximum speed limit. Does that phenomenon appear to be recurring in 65 mile per hour States? In States where truck speeds are still 55 on 65 mile per hour posted roads, do you believe that the speed differential creates as much or more of a hazard than where the speed limit is the same for cars and trucks?

Mr. O'NEILL. Mr. Chairman, much has been made of some research findings from some years back that speed variance is a factor, as well as speed, per se, in the likelihood of crashes occurring. However, I think that the effects of speed variance on divided highways has been greatly overstated. Much of the research on speed variability comes from roads that were not divided and involve a lot of special circumstances such as crossing vehicles and opposite direction vehicles. But there is no doubt that speed variance does contribute to the likelihood of crashes. What we do know is that a sure way to increase speed variance is to increase the speed limit, because some motorists do speed up and some do not, so you have increased the variance.

When we went to a national 55 mile per hour speed limit, speed variance decreased. Now that we have gone in many States to a 65

mile an hour speed limit, speed variance has increased in those States.

The question of split speed limits for trucks is, I think, rather straightforward. We have taken measurements of speeds in States with and without split speed limits for the trucks and we find no difference in the speed variance in the States with split speed limits for trucks than we find in the States that have just gone to 65 for all vehicles. Variance has increased in both circumstances.

Mr. MINETA. In your testimony you state that the Federal Government should set compliance requirements in order to encourage States to enforce existing speed limits. But you state a concern that the proposal that is currently under review allows States three years, during which they might be tempted to abandon speed enforcement so that compliance in subsequent years would be easier to achieve. You suggest a standard based on national averages for miles traveled on different types of roads.

If you were to craft a monitoring formula that was intended to achieve equity and safety, what would those components be?

Mr. O'NEILL. Mr. Chairman, I think the same measurements could be taken in the States. In other words, the same measurements of the proportions of vehicles traveling at different speeds on different highway types. But instead of then combining those measurements using weights from the State, you could combine those measurements using the same weights for each State so that the scores can then be compared across States because we do know that today some States are taking speed violations seriously. They are out there enforcing. They are trying quite seriously to control speeds. This includes some States with 55 mile per hour limits and some States with 65 mile per hour limits. There are other states that have substantially de-emphasized speed enforcement. They are not taking it very seriously at all.

If we allow a formula that says, "Well, let's see how well you did in 1990," I think we are going to be unfairly penalizing the States that are currently and presumably would continue in 1990 doing a good job, and we would let the States that are not taking speed enforcement very seriously right now have an easier time of complying in the future.

Mr. MINETA. Mr. Shuster?

Mr. SHUSTER. No questions.

Mr. MINETA. Mr. Visclosky?

Mr. VISCLOSKY. I have no questions, Mr. Chairman.

Mr. MINETA. Very quickly, since we have a vote to respond to, in earlier testimony it was mentioned that one highway safety priority might be the promotion of responsible advertising on the part of auto manufacturers that does not glorify fast, powerful cars and driving practices. Can you tell us how such cars rank in terms of involvement in fatal crashes?

Mr. O'NEILL. Yes, Mr. Chairman. We took the lead in complaining rather vocally about Nissan's ad for its ZX Turbo that aired on the Superbowl with much fanfare. We heard yesterday from Nissan Motor Corporation that they will no longer air that ad, and we thank them for that. We think that airing it once was too much because it was an ad that simply said, "Look how fast this car can go." The fact is that high-performance cars or sports cars or cars

with a sporty image have very high fatality rates—much higher than average. When you look at the fatality rates for individual makes and models of cars, the cars that have the highest fatality rates are all sports or sporty models—high-performance cars—that are often touted and advertised in ways that emphasize their excessive speed capabilities.

Let's just think about the Nissan ZX Turbo. This is a turbocharged car with a top speed of 155 miles an hour. That top speed is electronically controlled by the design chosen by the manufacturer. They could have chosen to electronically control that top speed at 100 miles an hour or 110 miles an hour and still had the same acceleration capabilities for driving at legal speeds. They chose 155 miles an hour.

I think that we have to ask some questions about what we are doing in our society when we have maximum speed limits of 65 and manufacturers deciding that 155 is the appropriate speed that the car cannot be driven above.

Mr. MINETA. Well, maybe the Maryland State Police will buy those kinds of cars.

Again, Mr. O'Neill, let me thank you very much for your leadership with the Highway Safety Institute and thank you for your appearance here today.

Mr. O'NEILL. Thank you, Mr. Chairman.

[Mr. O'Neill's prepared statement appears on page 1444.]

Mr. MINETA. We have a call to the House for a vote and so we will recess for ten minutes.

[Recess.]

Mr. MINETA. The committee will come to order.

We are pleased to have Colonel Elmer H. Tippett, Superintendent of the Maryland State Police, representing the International Association of Chiefs of Police for us today.

Colonel Tippett, your statement will be made a part of the record. Please go ahead and proceed in your own fashion, sir.

TESTIMONY OF COL. ELMER H. TIPPETT, SUPERINTENDENT OF THE MARYLAND STATE POLICE, REPRESENTING, INTERNATIONAL ASSOCIATION OF CHIEFS OF POLICE, ACCOMPANIED BY RON SOSKOWSKI, EXECUTIVE DIRECTOR, INTERNATIONAL ASSOCIATION OF CHIEFS OF POLICE

Colonel TIPPETT. While you were gone I went out and tried to buy one of those 280s and I couldn't afford it, Mr. Chairman, so we pass. [Laughter.]

Good afternoon, Chairman Mineta. It is a pleasure to be here today. I am Elmer Tippett, Superintendent of the Maryland State Police. Today I am representing Superintendent Thomas A. Constantine, the General Chairman of the State and Provincial Police Division of the International Association of Chiefs of Police.

We have surveyed our members State by State concerning the new speed compliance formula so that we could accurately represent the feelings of State law enforcement agencies. Our members are clear: the IACP Highway Safety Committee and the State and Provincial Division continue their strong support of the national maximum speed limit concept through enforcement and education,

but we also continue our strong opposition to the Federal monitoring/sanctions process.

We feel that monitoring speed, as with the NMSL, will improve safety, but in an ironic twist the monitoring/sanctions process causes reductions in highway funds allocated to the States which, in effect, results in a negative safety impact by deferring necessary highway improvements. In States where compliance figures are satisfactory, oftentimes this is because other safety priorities such as DWI and drug interdiction are relegated to secondary and tertiary priority.

Thus, we in law enforcement are in the classic Catch 22. If we don't comply, safety is negatively impacted because our funds are reduced. If we comply, safety is negatively impacted because other priorities are reduced. It is hard to see how we can win this one.

Allow me to expound briefly on our position.

Police executives know that many factors contribute to fatal and injury vehicle crashes in this country. Primary known causes are: speed, drunk and drug driving, and other hazardous moving violations. Speed, therefore, cannot be looked upon as the sole issue, but only part of a complex puzzle. Therefore, speed enforcement is a top priority, but it is only one component of a total, comprehensive highway safety plan.

The compliance program does not recognize overall safety efforts, and, by reducing funds, would reduce the highway improvement and safety projects that a State could undertake.

The speed monitoring formula and the corresponding sanctions tend to create a traffic enforcement program that is not properly balanced. Limited resources and other critical factors, such as the national proliferation of narcotics trafficking, complicates an administrator's responsibilities of assignment and prioritization, especially when examining the factors influencing traffic accidents.

Although it is true that the States' rights argument can be manipulated for many purposes—both legitimate and otherwise—there are sound reasons to conclude that an issue such as this one practically should be left to State determination. It goes without saying that geographically, commercially, economically, and trafficwise, States are different.

For example, the term "non-interstate road" encompasses a wide range of realities. The accident records of an urban freeway and a two-lane rural roadway are probably quite different. Under the compliance formula, these roads are treated equally.

Some of the data elements in the proposed formula may be determined by a small volume of vehicles in a given category and, therefore, subject to large, year-to-year fluctuations. A State could go in and out of compliance because of random variations.

It appears to many of our members that the formula will favor the urban States with high vehicle miles traveled. It appears to some that the formula will favor States which have a poor history of compliance. Whatever your interpretation of the formula, one thing is clear: no plan will adequately represent all the States equally because of the inherently different situation of each case. So the main argument for States' rights in this case is simple: the State roads and traffic are very different State to State.

That sanctions have been designated as a way to approach this problem does not seem totally warranted by the information. The U.S. General Accounting Office has found little relationship between the current Federal compliance requirement and the level of a State's highway or enforcement efforts. Honestly speaking, we all want the highway funds, and speed is a top priority of all of us in the State police agencies; but, in the final analysis, we do what we have to do to make the best use of the limited resources we have and to protect and aid our citizenry. We ultimately have to answer to our State constituency.

State police executives have historically stated that the use of sanctions for noncompliance are dysfunctional because it reduces the amount of money available for traffic safety. This can only lead to a downward spiral of noncompliance, less money, and increased sanctions.

On the other hand, incentive base rewards for compliance could lead to a reduction in fatal accidents. This would lead other States to see the financial benefit of compliance and reduced fatals and, over a period of time, have a significant effect on the fatal accident rate in the country.

There are several specific comments our members have made about the formula which we would like to share with you.

If a base index value is used, it should be based on a three- to five-year measurement or observation period and not a single year. If the base year is, for whatever reason, nonrepresentative of the State's average traffic volume or speed compliance level, the State could find itself in noncompliance due solely to the statistical aberration.

We would, therefore, recommend that the base State score be the average of no less than three and not more than five consecutive years.

The formula focuses on fixed speeds rather than on variability of speed.

It is fairly difficult for many of our members to evaluate the formula because much of the data is not currently collected. Estimating the State compliance scores is difficult because the data is not currently gathered on these speed ranges.

Gentlemen, I can only reiterate our support for the concept of a national maximum speed limit and our opposition to the Federal monitoring/sanction programs. I have attached to my testimony a copy of our resolution concerning this issue. I think the resolution speaks for itself.

Thank you for allowing me the opportunity to address you.

Mr. Chairman, I may also add that next weekend, the 30th of March, all of the State police superintendents will be meeting with Secretary Skinner in Chicago to come up with some comprehensive programs for speed enforcement and safety on our highways in the United States.

I would also like to add that Maryland is one of the States that is going to be adversely affected by the sanctions that are placed on it. We have a very, very comprehensive speed enforcement program in our State, but, because of the sheer volume of traffic and other things for our police officers to do, we are unable to come into compliance. However, over the years we have continued to in-

crease our enforcement and we have continued to increase our drunk driving and our narcotics interdiction, and all those things play on what we can do as far as speed compliance.

Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much, Colonel Tippett, for your testimony.

You are right. I guess California, Massachusetts, Maryland, and Connecticut, among others, have been notified of this latest in terms of sanctions. I was just looking at the California letter. I guess it is something like 53.6 percent in terms of noncompliance.

One thing that did strike me: on page three of your testimony you said that limited resources and other critical factors such as the national proliferation of narcotic trafficking complicates an administrator's responsibilities of assignment prioritization, especially when examining the factors influencing traffic accidents.

I am wondering about the terms of affecting assignments and prioritization. I guess I am asking how it is that the national proliferation of narcotic trafficking complicates assignments?

Colonel TIPPETT. Well, again, we only have a limited resource of the number of police officers that we have that we can assign specifically to the traffic enforcement function. Again, I guess the biggest scourge, as we all know, in this nation now that is facing us is the narcotics problem. Therefore, I am required, just by the mere problem, to divert some of the people that would be out there on the enforcement level on the highways to transfer them into the narcotics section to address that problem. Therefore, there are less people on the highway to enforce the speed limit.

Even at that, we have assigned special interdiction squads that actually are out there that are trained to look for other things when they become involved in speed enforcement. They look for narcotics violations. Therefore, if you stop someone for a speed violation and you find narcotics in the car, that then takes the police officer off of the street and there is nobody out there to enforce compliance.

Mr. MINETA. Can you tell us in what way the data elements of the proposed formula would be more susceptible to annual fluctuations in smaller States than in larger States?

Colonel TIPPETT. Again, it has to do with volume. And I am not so sure that anybody knows what this formula says. I think everybody looks at it, and I think as many people as there are in this room you will probably have a different interpretation of the formula.

Here with me today is Mr. Soskowski of the IACP who is our executive director. If Ron or the lady with him would care to answer that part of it—I have no idea what that formula means. We try to comply with it. We say we are doing something, and it is not.

Even if we, in Maryland, changed our roadways to 65, we would probably come into compliance. But we are not in a position to do that because we think we are saving lives at 55. We are being penalized for that.

Mr. MINETA. You state that sanctions reduce the amount of money available for highway safety. Since the sanctions do not affect highway safety authorizations, in what ways do highway safety funds get reduced when States are, in fact, sanctioned?

Colonel TIPPETT. Well, you just lose that amount of money and they take away—it is not the money that you would get, it is the money that is filtered through your Department of Transportation, which would then cut back on the amounts of money it has available to do other programs; therefore, it reduces all of our programs.

Mr. MINETA. Let me ask something about the last page. You reiterate your support for the concept of a national maximum speed limit.

Colonel TIPPETT. Yes, sir.

Mr. MINETA. And your opposition to the Federal monitoring/sanctions programs.

Colonel TIPPETT. Yes, I think——

Mr. MINETA. If we drop that monitoring program, what makes you think we are going to get compliance?

Colonel TIPPETT. Well, I don't have any problem with monitoring. I think what we need to do is—we need something more of a proactive rather than a negative type of sanction. Look at what the States are doing out there and reward them appropriately. Just don't take money away because they can't meet a certain formula.

Again, as I said, in my state we have a very aggressive enforcement program, but we are not meeting the requirements. Therefore, our State is going to be penalized for that. But we have an aggressive enforcement program not only in the areas of speed, but also drunk driving and everything. I think that is what you have to look at. It is more of a carrot and stick type of thing rather than a negative.

Mr. MINETA. All right.

Mr. Visclosky?

Mr. VISCLOSKY. I have no questions, Mr. Chairman.

Mr. MINETA. Well, Colonel, let me thank you again very much for your being here and for representing the IACP on this very, very important issue. Thank you for your leadership on this issue.

Colonel TIPPETT. My pleasure, Mr. Chairman.

[Colonel Tippett's prepared statement appears on page 1452.]

Mr. MINETA. Now I would like to call Mr. John Archer, the Managing Director of Government Affairs for the American Automobile Association.

Mr. Archer, your statement will be made a part of the record. Please go ahead and proceed in your own fashion.

TESTIMONY OF JOHN ARCHER, MANAGING DIRECTOR, GOVERNMENT AFFAIRS, AMERICAN AUTOMOBILE ASSOCIATION

Mr. ARCHER. Thank you, Mr. Chairman.

AAA, serving more than 31 million members, appreciates the opportunity to testify. While our testimony addresses a number of concerns, I will touch on just four: highway safety, expansion of the highway system, highway funding, and opposition to a gas tax for deficit reduction.

Regarding the tax issue, AAA continues to take President Bush at his word. In a letter to AAA he stated the following: "A gas tax increase to balance the budget would particularly hurt lower wage earners, families with both spouses working, and farmers and residents of Western States who have to drive long distances. Let me

say it one more time: as President, I will oppose any attempt to raise taxes to balance the budget. That means gas taxes, too."

In addition to the arguments noted in the President's letter, three others are especially important.

First and foremost, the American people are against a gas tax for deficit reduction.

Second, a gas tax increase for deficit reduction would not raise the money predicted by its proponents. The estimate of $1 billion for each penny is wrong. Those are gross receipts. Net receipts have been variously estimated from about $300 million to $600 million for each penny raised, depending on estimated economic drag and whether diesel fuel is covered by the tax.

Finally, such a tax would fundamentally damage the highway program. We care about that program and would like to see it expanded.

AAA particularly would like to see more bypasses around congested urban areas, and outer beltways where feasible. Of course, that is going to take more money.

Like many other people and groups, AAA believes the Federal Government should establish minimum annual obligational ceilings no lower than annual trust fund receipts, including interest. It should not increase reliance on tolls, because toll financing leads to excessive interest costs, collection inefficiency, motoring inconvenience, and constitutes double taxation of the motorist.

Proposals to relax Federal toll constraints are particularly difficult to understand when more than $10 billion languishes unspent in the Federal highway trust fund.

Highway funding, of course, relates to another key issue—traffic congestion. Approaches to solve it should emphasize incentives, not penalties. For example, if the Federal Government wants to encourage public transportation, it should make the cost of commuting to work by public transportation tax deductible. It should not tax free parking, as many would suggest.

Successful intermodal planning emphasizes linkages to the automobile because the auto is the dominant mode of travel. For example, if you want to improve transit ridership, increase parking at subway stops—especially end-of-the-line stations.

AAA supports all reasonable efforts to reduce congestion that preserve personal mobility and don't discriminate against the motorist. Examples include some of the old reliables such as synchronized traffic signals, fringe parking for transit, carpools and vanpools, staggered work hours, and realistic land use planning.

We also support some approaches that are more controversial, including incentives for large trucks to refrain from using crowded urban beltways and streets during rush hour, and for the future intelligent cars and highways.

Those so-called smart cars relate to another paramount AAA concern—highway safety. For all the compelling reasons that have already been mentioned at this hearing, all reasonable highway safety measures should be implemented. Examples would include: automatic restraints in all passenger vehicles; universal adoption of effective safety belt and motorcycle helmet laws; application of all Federal motor vehicle safety standards to vans, mini-vans, and pick-up trucks; improved side-impact standards for cars; anti-lock

38-253 O—91——45

brakes in all vehicles, especially large trucks; and a variety of other truck safety measures—particularly effective implementation of the recently-enacted improved licensing and testing standards.

AAA also continues to be seriously concerned about the safety implications of large trucks sharing the highway system with the growing fleet of smaller cars; thus, AAA opposes any further increases in existing Federal maximum truck size and weight standards.

Thank you for the opportunity to appear.

Mr. MINETA. Thank you very much, Mr. Archer, for your very complete statement here.

The Committee on Public Works and Transportation, as you are very well aware, has introduced and supported H.R. 41 through the committee leadership of Congressman Anderson and Congressman Hammerschmidt. Of course, this is to oppose any increase in motor fuels excise taxes for deficit reduction purposes.

Does AAA base its opposition to a gas tax increase primarily on the adverse affects of such a proposal on the Federal aid highway program?

Mr. ARCHER. That is certainly one factor, but it is not the only one. We are concerned about the fact such a tax would adversely affect the tourism industry. We also believe that a gas tax for deficit reduction would be the cruelest kind of regressive tax. A gas tax makes sense if imposed to improve roads. What could be fairer than the concept that the more you drive the more tax you pay? But when you begin to use the gas tax as a general funding mechanism, it begins to impact lower-income groups, in a discriminatory way.

Mr. MINETA. The committee has received testimony identifying urban congestion as a major concern throughout the nation. Some recommendations for relieving urban congestion problems have focused on the use of more mass transit and shared ride transportation. Does AAA support the establishment of an urban flexible program that would provide local entities the authority to use highway trust fund revenues for both highway and mass transit projects to relieve urban congestion?

Mr. ARCHER. Frankly, no. It is very difficult, when you have unfunded highway needs on the order of $30 billion a year, to ask our members to fund transit. That is not to say that transit isn't important. We recognize it is important. But so are roads, and we think that the viability of the trust fund concept is undermined when you begin to commingle funds.

One of the best ways to move people today is through carpools and vanpools going down Shirley Highway-type carpool/vanpool lanes. That is one approach to examine.

Also relevant are future demographics: the population increases are not going to occur in the inner cities where heavy transit is particular advantageous; rather, growth primarily will occur in the low-density suburbs in the South and the West. In those areas, a better-planned road system that would feature carpool lanes is the first step that should be implemented.

AAA also favors of fringe parking lots, an obvious approach that ironically in the 1970s was opposed by some for clean air reasons. One of the big complaints we get from our members is, "I don't use

the subway because I want to drive to the parking lot and I am not sure I can use the lot." (Because it might be filled to capacity.) A program that would increase parking at the end-of-the-line of subway stations would constitute a surprising benefit.

AAA also would like to see traffic lights and other signals synchronized in a systematic way, rather than having situations such as in Alexandria, where signals are specifically designed to create congestion.

We think that those are the kinds of reasonable things that could be done easily.

Approaches that are more difficult to achieve but we think are meritorious include limiting the usage of large trucks and other commercial vehicles during rush hour, as was done in the Los Angeles Olympics. Obviously ATA and others are going to have severe problems with that. But if it is implemented with incentives that allow shippers and others that they can save money by delivering at 12:00 when the roads are empty, you achieve the happy circumstance where both the trucking industry and the motorist benefit.

Mr. MINETA. AAA opposes any further increases in the existing truck size and weight standards. I assume that is based on safety considerations. Is there evidence available to support the safety concerns that AAA has expressed to the committee?

Mr. ARCHER. Yes.

One factor that muddies the safety record of larger trucks is that they are primarily operated under a restricted permit system. Those particular trucks—by being under a permit system—are limited to very safe roads—roads built to the highest design standards, often very straight roads that are compatible with those trucks.

Those trucks also are typically driven by the very best drivers in the industry.

If you expand truck size and weight standards, those trucks will no longer be driven only by the best drivers; they will be driven by the worst drivers, too. No matter how the truck network is structured, these big trucks will be driven everywhere.

The history of the 1982 Act I think supports that contention. Initially what was envisioned was a restricted network. But the emerging reality is that those large trucks travel everywhere particularly if they are going to terminals or shipping points.

Mr. MINETA. Under the proposed scenic byway program there would be approximately 39,000 miles of scenic roads. Would the States be permitted to construct new scenic roads, or would the proposal only focus on the existing highway network?

Mr. ARCHER. The existing highway network that you are alluding to, I believe, is the AAA program, which is a designation program. We certainly would not want to foist anything down the States' throats. As a first step we should designate routes. The economic benefits to those designations are very significant, particularly because overseas tourists traveling to the U.S. become one of our best "exports."

The question of whether or not you construct new roads is obviously a question of funding priorities. As a staunch advocate of scenic roads, I would have to admit that there are many other priorities and funding is scarce. However, if funding was increased,

either at the State, local or Federal level, then it seems to me construction of new scenic roads should be examined.

Mr. MINETA. Based upon the well-documented transportation needs of the nation, there is strong support for increasing expenditures to address the kinds of needs that have been talked about. In addition to drawing the cash balance in the highway trust fund, what other recommendations would AAA support for increasing expenditures to address the kinds of needs that everyone brings to us?

Mr. ARCHER. First, we would certainly support impact fees. We think that is eminently sensible because those developers creating congestion should pay for it. But we wouldn't dismiss the notion of the highway trust fund balance. We fervently believe that it is more important than a lot of people think. The reason for that is psychological. How can you realistically go to the American public—or, in our case, our 31 million members—and tell them to pay more money for roads if the Federal Government is not willing to spend the money that it is already collecting?

So spending that $10 billion-plus in the Highway Trust Fund not only provides an additional $10 billion; its additional virtue, is to show credibility to the people that the money will be spent and thus make it easier to raise taxes. It would make it easier for AAA, for instance, to go to our members and say, "Look, there really are great roads. We need more money. If raised, the money will be used appropriately."

Right now the trust concept is being undermined to the point where a lot of people don't believe that. They believe that if taxes are increased—either Federal or State, but particularly Federal—because of the games that are being played with the Federal deficit, you just may increase budgetary gimmicks. The suspect increased taxes really won't improve our road system. As long as that situation exists, it is going to be very difficult to raise taxes.

Mr. MINETA. Mr. Visclosky?

Mr. VISCLOSKY. I would like to follow up on the chairman's last question. Does the AAA currently support, if we begin a spend-down on the Highway Trust Fund, an increase in the gasoline tax, for example?

Mr. ARCHER. That is not a policy issue that we have addressed. We won't address the issue of raising the Federal gas tax until such time as the trust fund balance has begun to be spent down. Right now it is increasing, as you know. The latest budget contemplates $12 billion to $13 billion in highway spending. In fact, the trust fund right now can support $15 billion if you count the interest—and you definitely should count the interest.

Mr. VISCLOSKY. I just want to be clear. On the last page of your testimony in your stance regarding tolls—which I appreciate—you do say there are better ways than toll financing to solve the problem, such as drawing down on the Highway Trust Fund balance, impact fees, and traditional taxing methods.

Mr. ARCHER. That's right.

Mr. VISCLOSKY. You are specific about Highway Trust Fund, you don't have a position on the tax?

Mr. ARCHER. As I said, we have not addressed the issue of a Federal gas tax, and we won't do so until the trust fund begins to be drawn down.

Mr. VISCLOSKY. Okay.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Archer, let me ask: what kinds of education information programs do you believe have been most effective in enhancing highway safety? I know AAA does a lot of that.

Mr. ARCHER. We do, Mr. Chairman. You are kind to say that. We are one of the holdouts. We believe that driver education still has benefits that are substantial. We were the first ones to say that bad driver education is worthless—and there is a lot of that around. But if you get a good program, it does do very good things. We are very proud of our program that we run with the military. They say it is one of the best programs that they have ever had in terms of reducing accidents.

Mr. ARCHER. But, in general, when you look at driver education there is an awful lot of lousy driver education. But if it is done right, it has substantial benefits.

Like everybody else who has appeared in this room this morning, AAA fervently believes that seatbelt education is absolutely right, child restraint education is absolutely right. Child restraint education may even more important because, unfortunately, a lot of people are using child restraints in improper ways, as you know. We need to educate mothers who think they are using child restraints correctly but, in some instances, aren't. That is a wonderful objective, it seems to me.

Another program AAA has begun is "Starting Early." It now reaches a little over 20 percent of the nation's schools. It is a program to familiarize kids from kindergarten up to 12th grade, but particularly from kindergarten to 6th grade, regarding the problems with alcohol.

Our foundation published a study that basically suggested very strongly that kids are inundated with advertising for beer and alcohol selling the notion of drinking and driving. This "Starting Early" program that AAA initiated is an attempt to try to combat such advertising. By getting to kids before they get a license to drive, before they have seen literally thousands of beer commercials, we hope to prove to them—that drinking and driving is wrong.

Mr. MINETA. With the growing population, should we have a driver education program for seniors?

Mr. ARCHER. That is a good question. The resources that it would take, to conduct such a program nationally, very frankly, would test budget realities. That is not to say that I don't think that such programs would be a good thing. In fact, AAA runs such programs. But they are expensive, and if you try to do it for the whole nation you will be looking at a considerable cost.

Mr. MINETA. Do you have any thoughts on the specific components of what a comprehensive highway safety program might look like in a new authorization program for us?

Mr. ARCHER. Well, we certainly think that the emphasis currently on occupant restraints is absolutely right and should continue. We certainly believe that the emphasis that this committee should

be proud of in pushing for the MCSAP programs—and the American Trucking Association's approach they can also be proud of—is absolutely right and should be continued.

One area that I believe you will probably hear more about—you alluded to it, I believe, earlier—is the question of accident data and whether we have good accident data. I would differ with one of the earlier witnesses. It is absolutely true that, with respect to fatalities, we have good data. After that available data is very suspect.

Statistical measures are changed so often that you find yourself citing statistics that you meticulously calculated and know are right, and you have an opponent who has done the same, but yet you seem to prove different things. The notion of having some kind of accident data center seems to me to be long overdue.

The one point that Ms. Claybrook made earlier—that we ought to have more critical evaluation of data—I think is absolutely right. We have to define what safety approaches will really save lives and prevent accidents and then employ those safety techniques. The best way to start doing that is to develop better data and data analysis than we have right now.

Mr. MINETA. One of the other big things I believe that AAA has been involved in is uniform signage. How do you feel your campaign is doing on that score?

Mr. ARCHER. Not as well as we would like. The Federal Government manual we think is excellent. We support that. We are on its advisory committee in fact. But, I suspect there are a lot of nonconforming signs. I also suspect another that with an aging population we are going to have to start looking at signs that are, frankly, just bigger.

Mr. MINETA. Well, Mr. Archer, thank you very, very much for your testimony and thank you for the work of AAA in terms of what you have done over the years. We appreciate your being here.

Mr. ARCHER. That is very kind, Mr. Chairman. Thank you.

Mr. MINETA. Thank you.

[Mr. Archer's prepared statement appears on page 1397.]

Mr. MINETA. There being no further business before the subcommittee, we stand adjourned.

Do we have a next meeting date yet? Not yet? Then I guess it will be at the call of the Chair.

Thank you very much.

[Whereupon, at 2:51 p.m., the subcommittee was adjourned, to reconvene at the call of the Chair.]

PREPARED STATEMENTS OF WITNESSES

Testimony of

John Archer
American Automobile Association

Before the

Subcommittee on Surface Transportation

Re the

Reauthorization of the Surface Transportation Program

March 22, 1990

The American Automobile Association, serving more than 31.5 million members, appreciates this opportunity to comment on the reauthorization of the federal highway program and the current reexamination of U.S. surface transportation.

When contemplating possible changes in transportation it is essential to focus on two simple but critical facts:

First, **Americans depend on cars** to get to work and to lead their everyday lives. Indeed, the entire economy depends on the motor vehicle.

Second, **transportation must address people's needs.** It must emphasize **positive incentives** that make sense to people, so they will readily embrace them because it's in their interest to do so. If it includes extreme measures the American people have rejected many times before, it will be a very conspicuous failure.

This two-part perspective strongly influences AAA's views on the nine issues AAA will address today:

- **opposition to a gas tax increase for deficit reduction**
- **highway funding**
- **expansion of the highway system**
- **scenic byways**
- **traffic congestion**
- **Intelligent Vehicle/Highway System**
- **highway safety**
- **truck size and weights; and**
- **toll financing**

OPPOSITION TO A GAS TAX INCREASE FOR DEFICIT REDUCTION

Regarding the tax issue, AAA continues to take President Bush at his word. In a letter to AAA he stated the following:

> **"A gas tax increase to balance the budget would particularly hurt lower wage earners, families with both spouses working, and farmers and residents of Western states who have to drive long distances... Let me say it one more time: As President, I will oppose any attempt to raise taxes to balance the budget. That means gas taxes, too."**

In addition to the arguments noted in the President's letter, three others are especially important:

First and foremost, the American people are against a gas tax for deficit reduction. The Washington Post's own poll shows more than 70 percent oppose such a tax.

Second, a gas tax increase for deficit reduction would not raise the money predicted by its proponents. The estimate of a billion dollars for each penny is inaccurate -- those are gross receipts. Net receipts have been variously estimated from about 300 to 600 million dollars for each penny raised, depending on estimated economic drag and whether diesel fuel is covered by the tax.

Finally, such a tax would fundamentally damage the highway program.

HIGHWAY PROGRAM

We care about that program and would like to see it expanded. AAA particularly would like to see **more bypasses around congested urban areas**, and **outer beltways where feasible.**

Whether those roads would be designated as part of an expanded interstate system or labeled part of a "system of national significance" is not really important. But they should be built to the safe design standards of today's limited access highways. Of course that is going to take more money.

The Federal Highway Trust Fund annually produces approximately $15 billion in tax revenues and interest income. Let's put trust back into the trust fund concept and start spending all of that $15 billion on roads -- not on making the deficit look smaller.

Many groups are joining in an effort to increase Federal-Aid Highway spending from approximately $12 billion in fiscal year 1990 to $15 billion in fiscal year 1991. AAA joins virtually all the associations representing state and local governments in calling for the Federal Government to establish minimum annual obligation ceilings no lower than annual trust fund receipts, including interest.

Spending down the balance in the Highway Trust Fund, including interest earned on highway users' monies paid into the

Trust Fund, will help restore the efficacy of the basic user fee concept.

Forty-seven of the nations' Governors have urged the Appropriations Committee "... not to deprive taxpayers of some $3 billion worth of transportation improvements they are paying for at the gas pump this year." AAA agrees with these 47 Governors that "... at a time when highway and bridge needs are critical and expenditures inadequate, gas tax revenues continue to accumulate in the Highway Trust Fund."

TRAFFIC CONGESTION

Highway funding concerns relate directly to another key issue: **traffic congestion.** In the old days, the rallying cry for roads was **"Get the farmer out of the mud!"** Today it's **"Get the commuter out of gridlock!"**

That's obviously of interest to AAA. Our members comprise about 20 percent of the U.S. adult driving population. They want a better planned transportation system.

But better planning means more realistic planning and more **realistic planning emphasizes incentives, not penalties.** For example, if the federal government wants to encourage public transportation it could make the cost of commuting to work by public transportation tax deductible. It should not tax free parking, as some suggest.

Successful intermodal planning emphasizes linkages to the automobile because the auto is the dominant mode of travel. For example, if you want to improve transit ridership, increase parking at subway stops, especially end-of-the-line stations.

AAA supports all reasonable efforts to reduce congestion that preserve personal mobility and don't discriminate against the motorist.

Examples include some the old reliables, such as:

- synchronized traffic signals;
- fringe parking for transit;
- car and van pools;
- staggered work hours; and
- realistic land use planning.

We also support some approaches that are more controversial, including:

- incentives for large trucks and certain other commercial vehicles to refrain from using crowded urban beltways and streets during rush hour;
- and for the future, intelligent cars and highways.

INTELLIGENT CARS/HIGHWAYS

Advanced technologies offer potential for reducing urban congestion in the future through more efficient use of the freeway and roadway system. Artificial intelligence is currently

being tested in various areas associated with driver safety and routing systems, all designed to make the task of getting from point A to point B a less aggravating experience.

Advanced technology researchers are experimenting with computers, digital maps, and telecommunications, searching for high-tech systems that will manage traffic and keep it flowing. The goal is to integrate roads with vehicles into a smoothly running, efficient transportation system. One very long range goal is to make roads so "smart" that they can guide "intelligent" vehicles without direction from the drivers.

Those so-called smart cars are related to another paramount AAA concern: Highway Safety.

HIGHWAY SAFETY

To ensure continued success in reducing the number of accidents, injuries and deaths, AAA supports accelerated research designed to provide solid, substantive information to evaluate safety programs and vehicle safety standards already adopted.

In an effort to ensure the greatest level of safety possible for all motor vehicles AAA strongly supports NHTSA proposals to apply all federal motor vehicle safety standards to vans, minivans, and light trucks.

Safety considerations should be an integral part of every aspect of a new federal highway program, including efforts to promote safety improvements in vehicles and roadway operations. AAA believes driver safety can be enhanced through continued education and information programs.

Highways should be developed and maintained in such a manner as to reduce highway crashes and minimize the severity of injuries from accidents when they do occur. To prevent accidents and develop a more "forgiving highway environment, emphasis should be given to safer highway design, improved road conditions, and to the elimination of roadside hazards.

More than 45,000 people are killed and 3 million injured in traffic accidents each year. Because vehicle miles traveled are expected to double by the year 2020, fatalities could increase to approximately 90,000 in 2020 unless the fatality rate is reduced. In light of this harsh reality, it's essential to implement all reasonable highway safety measures.

Examples include:

- **Passenger restraints in all passenger vehicles;**
- **Universal adoption of effective safety belt laws;**
- **Application of all federal motor vehicle safety standards to vans, minivans and pick-up trucks;**
- **Improved side impact standards for cars;**
- **Anti-lock brakes in all vehicles, especially large trucks; and**

- **A variety of other truck safety measures, particularly implementation of improved licensing and testing standards.**

TRUCK SIZE AND WEIGHTS

AAA continues to be seriously concerned about the safety implications of large, heavy trucks sharing the highway system with a growing fleet of smaller passenger cars. Thus **AAA opposes any further increases in existing federal maximum truck size and weight standards** because the present legal size and weight limits applying to trucks and combinations of vehicles already tax the limits of safety.

AAA also opposes the establishment of one set of truck size and weight limits for the Interstate System and higher limits for other highways. Grandfather clauses which permit size or weight limits greater than current federal maximums should be repealed.

AAA opposes efforts to liberalize the use of so-called "longer combination vehicles" (LCVs). The Federal Highway Administration has already found that "the states are currently providing opportunities for controlled use of LCVs. There are positive use aspects of LCV use, but many unresolved issues argue against their immediate widespread use."

The trucking industry contends that states should be given the discretion to allow the use of LCVs having gross weights in

excess of 80,000 pounds. This would be the first step in establishing an extensive network for the operation of LCVs. It would not be long before the industry would conduct an all-out campaign in the states to convince legislatures that their laws should be in compliance with the more permissive federal law. Not long thereafter the industry would be back at Congress's door asking for a national network for LCVs in the interest of "nationwide uniformity" and greater productivity.

Congress -- and particularly this subcommittee -- is to be commended for the leadership it has demonstrated in truck safety issues in recent years. But in those years Congress has also curtailed state authority to place limitations on truck dimensions. Congress should not turn its back on the potential dangers of LCVs and throw the decision back into the laps of states while preempting the states' powers to address these issues.

SCENIC BYWAYS

AAA strongly supports scenic roads. Increasingly we have members who want more pleasant alternatives to Interstate travel.

They want to travel on roads that take them through the most scenic, historic, or culturally interesting areas. To satisfy that desire, AAA has designated 39,000-miles of scenic roads. To be included, a road must meet at least one of five criteria:

- **quintessential scenery** (the best of the characteristic features or scenery of a state or region)
- **natural beauty** (strikingly scenic, natural features)
- **cultural beauty** (architectural, historic, or economic activities)
- **uniqueness** (usually a limited area unique to a region), and
- **scenic roads on public land** (byways designated by the federal government)

Scenic roads also have significant economic potential because of the synergistic relationship between scenic roads, tourism and the economy. A few details will help make this last point:

- **Tourism is one of the top three employers in more than 40 states;**
- **Driving for pleasure is a favorite avocation of more than 40 percent of American adults;**
- **Approximately 50 percent of foreign visitors use a car at least part of the time when visiting the U.S.; and**
- **Over 80 percent of U.S. vacation travel is done by car, truck or recreational vehicle.**

A scenic roads program has the potential to benefit vacationers and at the same time produce substantial revenue for states and private interests alike.

For the highway program it has added potential: expanded political support for the road program at a time when it needs it. Organizations that care about tourism may help support the highway program if scenic roads are a part of the '91 bill.

A federal scenic roads system should be designated and run by the states and eligible for federal funding. States also should be allowed to use some of the federal funds already allotted for highway planning and research to plan their scenic roads system. Current uses of scenic roads should not be unduly restricted, and money should not be directed from current road improvement and maintenance programs.

Serious consideration should be given to establishing an office of scenic roads in the U.S. Department of Transportation to help implement a scenic roads program. It could serve as a central clearinghouse for information about state programs, help guide state and local governments in designating and marking their scenic roads, and issue maps and publications about the national scenic roads system.

TOLL ROADS

Understandably scarcity of road funds is driving the call for greater use of tolls. But AAA still is troubled by toll financing for a number of reasons.

Excessive Cost: Toll roads will probably cost 3 to 4 times as much as toll-free roads because of bond interest charges and toll collection costs.

Double Taxation: If gas taxes are used to construct new toll roads, motorists will be paying twice -- once at the pump, once at the toll booth.

Breach of Trust: Highway users have paid literally hundreds of billions of dollars to construct the nation's highway system; they should not now be charged a toll to use it.

Inefficiency: Currently, fifteen percent of toll revenues are needed for the collection process while only one percent of motor fuel taxes are devoted to tax collection.

Inconvenience: Toll roads often provide few exits in order to minimize the number and therefore the costs of toll personnel. Users can't get off the road at convenient places and people living in some small communities cannot use toll roads built right next to them.

In taking an anti-toll stance, AAA doesn't minimize today's serious funding problem. But there are better ways than toll financing to solve it, such as drawing down the Highway Trust Fund balance, impact fees, and traditional taxing methods.

Thank you for the opportunity to express AAA's views on these important issues.

TESTIMONY BY

RICHARD F. CELESTE

GOVERNOR OF OHIO

on

SURFACE TRANSPORTATION REAUTHORIZATION

before

HOUSE PUBLIC WORKS AND TRANSPORTATION

SUBCOMMITTEE ON SURFACE TRANSPORTATION

March 22, 1990

Mr. Chairman, I am pleased to appear here today before the House Public Works and Transportation Subcommittee on Surface Transportation to discuss congressional reauthorization of the highway, transit and highway safety programs. I feel especially at home since Ohio is so well-represented on the subcommittee by Representatives Applegate, Traficant, and McEwen. Mr. Chairman, I also understand that a majority of my state's delegation has already testified on Ohio's behalf, and I am pleased to have the chance to lend my voice to theirs.

You will notice that my voice is somewhat hoarse, and, coincidentally, this affliction is related to highways themselves. I have spent much of this week traveling my state, announcing more than $1.1 billion in new highway projects. So I come to you a little the worse for wear, but with a recent and clear impression of Ohio's infrastructure needs.

Like other governors across the country, I followed with great interest the unveiling of the Bush Administration's "Moving America" policy. But I must say that I found it very disappointing. Although Secretary Skinner provided us with an excellent analysis of the problems plaguing our infrastructure, the plan itself falls far short of any real solutions to these problems.

Indeed, I believe that the Bush plan represents a reversal of the original intent of the Highway Act of 1956, the legislative embodiment of President Eisenhower's National System of Interstate and Defense Highways. If President Eisenhower's plan was a clarion call intended to "unite the nation," then I am afraid the current President's plan sounds a note of retreat from this ambitious purpose.

In his message, President Eisenhower noted the desperate need for highway development, repair and improvement. He said that "to correct these deficiencies is an obligation of government at every level. The highway system is a public enterprise. As the owner and operator, the various levels of government have a responsibility for management that promotes the economy of the nation and properly serves the individual user."

He saw the condition of our highway system as nothing less than a matter of our national defense. He was right then, and in this world of increasing economic competition, Dwight Eisenhower is even more right today!

President Eisenhower went on to say in his special message to the Congress that "in the case of the

federal government...expenditures on a highway program are a return to the highway user of the taxes he pays in connection with his use of the highway."

In other words, the notion has always been that the states should get back what we put in. But now, 35 years later, it is far from a reality. The "Moving America" plan moves us farther away still. This year, Ohioans will receive about $496 million in federal-aid highway funds. We will pay approximately $531 million in federal gas taxes. In total, Ohio will lose about $35 million just this year.

Even with the enactment of the 85% minimum allocation provision in the 1982 highway bill, Ohio's cumulative return has only been 80 cents for every dollar sent to Washington. And the irony is that in every major national infrastructure study released in the last 10 years, Ohio has ranked among the top five states where needs are measured against the lack of sufficient resources. 13% of our urban interstate, 22% of our rural interstate, and 21% of our bridges are considered structurally deficient.

And although we have been experiencing nothing less than highway robbery for more than a decade, President Bush has proposed a plan which would make the situation even worse. Instead of repairing the inequities in the current allocation of funds, the President wants to fly the white flag of surrender over the federal government's leadership role and shift responsibility even further to the states.

Secretary Skinner's introduction of the administration's proposal, I believe, belied an unfamiliarity with what states like Ohio are already doing to address infrastructure problems. Contrary to what the Secretary seems to think, in Ohio we have been taking up the slack left by diminished federal participation.

As I mentioned earlier, this week I announced a number of major highway projects throughout Ohio. We have funds for the projects because we raised our state gasoline tax by 5.2 cents. It is the second gas tax increase in three years. As a governor, I know that raising the gas tax is never an easy or popular action. But state legislators, the business community, and the traveling public have come to see the necessity of this additional revenue.

In addition, Ohio has passed a $1.2 billion bond referendum to finance local infrastructure and road improvements.

These increases have put the current gas tax in Ohio at 20 cents--one of the highest in the region. We will spend more than $800 million this year in state funds on highway and bridge improvements.

This is the reason I was particularly startled when Secretary Skinner's major recommendation was that state and local governments do more.

The Secretary even went so far as to say that the federal government cannot "bail out every system that hasn't been able to care for itself."

I disagree on two counts with the premise implicit in the Secretary's remarks.

First, infrastructure funding is not a federal bail out. It is a federal commitment that Secretary Skinner and President Bush are abandoning--which contrasts, incidentally, with the federal government's response to the Savings and Loan crisis--which was, in fact, a bail out.

I fail to understand why the federal government can be quick to come to the aid of failing private enterprises, but cannot seem to find the money to assist state and local governments in meeting the critical need we are discussing here today.

While countries around the world are responding to the need for more efficient infrastructure, the United States is allowing its to crumble. Why should the Secretary of Transporation have to go to Europe to see one of transportation's newest technologies--high speed rail? The federal government should be leading our investment in such technologies here at home. Instead of the states--Ohio, Pennsylvania, Florida and others--are struggling to make high speed rail work in the United States.

Second, I find it ironic that the administration would call into question the budget practices of state governments when $17 billion of highway and transit funds are being hoarded to disguise the size of the federal deficit. The results of this sort of budgeting, for highways as well as for other vital services, are obvious. I am proud to say that we in Ohio have avoided such gimmicks during the past eight years.

In Ohio, "read my lips" doesn't build roads. Across the country, "read my lips" doesn't build highways. States, like Ohio, are fulfilling our part of the Eisenhower bargain. I believe the time has come for the federal government to step forward to become a full partner with us once again, rather than sound the trumpet of retreat.

In an effort to help re-establish this partnership, I would like to offer the following recommendations. Many of these are similar to the policy principles adopted by the nation's governors at our recent winter meeting. I suggest that the federal government

**Maintain a significant federal role in assisting the states in financing highway and public transit projects.

**Increase the federal investment in transportation by fully utilizing the balances in the highway and transit trust funds.

**Increase the flexibility in federal transportation programs. One of the reasons the 85% Minimum Allocation Program is so successful--besides the additional funds coming

back to the states--is its flexibility. Ohio can use this money for any project, and it is not subject to the highway obligation ceiling.

**Initiate major changes to the distribution formulas which allocate billions of highway dollars. Factors that reflect the relative use of highways are more equitable to states like Ohio that have fewer miles of highways but are heavily traveled. For example, Ohio has 3.4% of the nation's interstate miles, but 5.2% of the traffic on the nation's interstate system.

**Increase the Minimum Allocation Program to 90% and make any discretionary money available to all states--including donor states. While I hope the Congress makes major structural changes to the federal-aid highway program that will eliminate Ohio's donor status, at the very least I believe the minimum allocation should be increased.

**Finally, maintain federal funds for operating assistance for our increasingly important system of public transportation.

Mr. Chairman, only with the firm adoption of these principles can we achieve the federal participation so crucial to the rebuilding of our nation's infrastructure. The President, Secretary Skinner, and many Members of Congress should be applauded for indentifying infrastructure as a priority. However, the real measure of the administration and, frankly, the Congress' resolve will be whether the rhetoric is matched with a federal funds. As we say in Ohio, this is where the rubber hits the road.

Mr. Chairman, I am pleased to have had the opportunity to share my thoughts with you. Although this is my first appearance before this subcommittee, as you may know the history of Ohio and the importance of public works for national defense and economic development have been intertwined since the founding of our nation.

Albert Gallatin, Secretary of Treasury under President Jefferson, developed a plan for an elaborate network of canals and roads to promote national defense and economic development. He convinced Congress to finance the construction of these public works through an innovative funding arrangement. Because of Secretary Gallatin's efforts, in 1802 the act that admitted Ohio

into the Union earmarked 5% of federal land sales in the new state for building roads linking the state with the navigable waters flowing to the Atlantic. The initial product of this effort was the nation's first interstate highway--the Cumberland road.

Mr. Chairman, thank you again for this opportunity, and with this shared history in mind, I look forward to our continued work together.

CENTER FOR AUTO SAFETY
2001 S STREET, NW SUITE 410 WASHINGTON, DC 20009 202•328•7700

TESTIMONY ON THE REAUTHORIZATION OF THE FEDERAL-AID HIGHWAY ACT BEFORE THE

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

MARCH 22, 1990

Thank you, Mr. Chairman. My name is Henry Jasny. I am the senior attorney at the Center where I work exclusively in highway safety. The Center is a not-for-profit, public-interest, consumer advocate organization dedicated to reducing losses on our nation's streets and highways because of unsafe motor vehicle and highway designs. I'm accompanied by Dr. Gerald Donaldson, our Associate Director for Highway Safety, who is here to help answer any questions you may have regarding our ideas for an improved Federal highway program.

Mr. Chairman, America's highway program is in serious trouble, with more threats launched against it than ever before, and a crisis in funding for the future that must be overcome by rapid, assertive action by our Congress. We believe that this reauthorization legislation will determine much of the quality of life in this country into the next century. This is no time to cripple our transportation system with short-term gains in deficit reduction by mugging the Highway Trust Fund, nor to continue practicing bookkeeping sleight-of-hand which holds this money hostage.

Two weeks ago today you were presented with a short-sighted vision of our nation's highway program that radically reduces Federal leadership in achieving improved safety, mobility, and economic health for America. You heard a proposal to dump large areas of the existing highway program into the laps of the states, counties, and cities with either much lower or no Federal funding.

Where will the money come from to assure the improvement and maintenance of these orphaned highways, streets, and bridges? How will improvements in materials and design that naturally produce more efficient, as well as safer, operations, come about if funding is supposed to issue from each state legislature where road funds often compete directly for general revenue with other, non-transportation programs? How will fragmentation of our highway program produce the increasing design uniformity that lowers the chances for accidents?

Cutting our Federal program to so-called systems of national significance is a retreat in the face of an even greater need than ever before for enhanced safety and mobility, and transportation-based prosperity. The Center believes that there are defensible national goals and needs that rise all the way from a county major collector route that is a lifeline for farmers and coal trucks, through an urban artery that is essential for the distribution of goods, up to an Interstate

highway with 100,000 vehicles a day. These national goals of safety, mobility, and economic well-being can be assured only through increased Federal funding and leadership.

As you appropriately stressed in your remarks of March 8 which opened the consideration of this watershed reauthorization bill, our transportation system must not be regarded as a collection of individualized concerns, but as a national program with overarching goals that are wisely managed by innovative leadership: "How we spend Trust Fund monies is as important -- if not more important -- than how much money we spend."

In his testimony before this committee on March 8, Secretary Skinner also stressed sound infrastructure management programs. He proposed that management programs become a condition for Federal aid because the states have not spent, in his words, these "free" Federal dollars as wisely or carefully as state and local funds.

We agree with this wholeheartedly, Mr. Chairman, and, in response, we are submitting to you today a highly detailed package of management initiatives which address the core program areas of the Federal-aid Highway Act. These comprehensive management proposals integrate many diverse provisions scattered throughout the current statute into major, cohesive programs for pavement, Interstate 4-R, highway safety, bridges, and maintenance. In each instance, the states would have to adopt

38-253 O—91——46

appropriate management systems approved by the Secretary in order to receive Federal funds.

In addition, we have also addressed specific critical problems of highway safety that need special emphasis in their own, new programs. One of these is a national effort to reduce the horrifying rate of losses we have begun to incur because of the 65 mph speed limit on rural Interstate highways. We call this the Interstate Safety Emphasis Program (ISEP), a national effort which will systematically improve geometric design, traffic control devices, safety equipment, and pavement markings so that the highway environment is safer for all drivers of all ages and capabilities.

The other safety emphasis area we propose is the Work Zone Safety Program which is aimed squarely at reducing the unacceptable losses in highway work zones. Last year America suffered a nearly 8% increase in work zone fatalities and the FHWA's response to this leap in deaths has been to dismantle what little regulatory and reporting machinery that has existed.

Apart from these two targeted safety areas, we also propose other amendments that, in concert with the preceding programs that I have referred to, will address the needs of elderly and handicapped drivers who need special help on the road. America's aging pyramid is being rapidly squared and it is time to meet the requirements of older drivers and drivers with diminished

capabilities.

We are convinced, Mr. Chairman, that our detailed legislative recommendations are the kind of brainstorming this Congress must engage in so that the transportation policy leadership this country so desperately needs and deserves will emerge over the next year and a half. Congress needs a forward-looking blueprint for reinvigorating our national highway program. Expanded, comprehensive safety policies and a systematic management approach to program expenditures must be keystones of the next highway bill. It will require hard work among you and your colleagues with the input of the private transportation community to forge the necessary changes.

Although we are a very small organization, our freedom to serve the public interest unreservedly, places us in an unique position to help our country's transportation program to achieve new levels of safety, economic benefits, and personal mobility. We stand ready to assist you in whatever way we can in the drafting of an innovative, responsive legislative document that will secure these goals.

We ask that the text of our oral testimony and accompanying legislative proposals be made a part of the hearing record, and we are prepared to answer any questions you may have for us.

STATEMENT BEFORE THE

SUBCOMMITTEE ON SURFACE TRANSPORTATION

OF THE HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

RELATING TO

TRANSPORTATION SAFETY

SUBMITTED BY:

LEONARD W. LEVINE

COMMISSIONER

MINNESOTA DEPARTMENT OF TRANSPORTATION

MARCH 22, 1990

Mr. Chairman, I am Leonard Levine, Commissioner of the Minnesota Department of Transportation. Thank you for permitting me to appear before your Subcommittee. I am very pleased to be here.

Transportation safety is a crucial issue in every state. Today I would like to briefly outline Minnesota's efforts to improve highway safety.

Minnesota's Approach

Governor Rudy Perpich has made improved transportation safety a top priority for the state of Minnesota. In spite of the fact, Minnesota has been a national leader in highway safety. During the last 3 years Minnesota has had the lowest traffic fatality rate in the nation.

However, we need to remember that this outstanding safety records does not tell the whole story. This week, in Minnesota, about 1,000 citizens will be treated in a hospital for injuries resulting from road accidents. This week twelve people will lose their lives on Minnesota roads. This week about $12 million dollars will be spent to provide medical care to those involved in traffic accidents in Minnesota. These figures indicate that we need to do more to improve the safety of our highways and railroad crossings. Our goal in Minnesota is to cut our highway death rate in half by the year 2000. That would reduce our highway fatality rate to .75 per 100 million vehicle miles traveled.

Last fall 14 public transportation safety forums were held around the state of Minnesota. These forums were led by local citizens who volunteered to coordinate and chair local task forces. These local task forces joined with the Minnesota Department of Transportation in sponsoring and promoting the public forums. We were very impressed by the dedication and hard work of these local citizen leaders and by the safety concerns expressed by the hundreds of citizens who testified at these meetings.

State legislators from both political parties participated in the safety forums. The issue is absolutely bipartisan. 2,000 people attended these safety forums and more than 700 men, women, and young people provided oral or written testimony. This citizen input has helped us identify transportation safety problems in Minnesota.

The Minnesota Department of Transportation has developed a Transportation Safety Enhancement Plan in response to the safety concerns addressed at the public forums. This plan includes short-range and long range elements.

Short-Range Elements

1. enforcement to modify driver behavior - with special focus on seat belt usage and increased DWI enforcement

2. support for safety legislation - including possible license plate revocation for repeated DWI offenses,

lowering the legal blood alcohol content to .08 percent and changes to the speed limit laws.

3. challenge local government to emphasize safety - local governments will be encouraged to develop their own highway safety plans and Mn/DOT will recognize counties completing at least one safety project in 1991 and 1990 by inducting them into a Transportation Safety Hall of Fame.

4. Improve rail crossings - railroad grade crossings constitute a significant transportation safety hazard. Mn/DOT has established a Minnesota Grade Crossing Safety Program and designated a program management team. Survey forms and instructions are being developed to field review and recommend specific signs and markings on 634 public railroad-highway crossings this year.

During 1990, Mn/DOT will conduct a demonstration project on the most heavily used rail line in the state. This demonstration project will focus on combining grade crossings and improving the remaining crossings on secondary roads in the project area. The results of the demonstration project will be used to develop a five year program to address similar concerns on other rail lines in the state. Priority will be given to the 12 busiest rail lines in the state.

5. add $7.6 million for highway safety improvements - low-cost safety improvements at hundreds of locations

throughout the state in 1990-91 will include improved striping, better sign visibility, additional turn lanes and longer pedestrian crossing times at intersections.

Long-Range Elements

The long-range plan focuses on four key areas:

1. the roadway - improvements to the roadway to enhance safety will include brighter pavement markings, improved sight distances on curves, better lighting and intersection improvements. Highway safety enhancements totalling $500 million will require obtained funding from the State Legislature

2. the vehicle - increased use of passive restraints and/or airbags, more frequent vehicle safety checks and use of daytime headlights are examples of the kinds of vehicle safety enhancements that will be actively supported and promoted

3. the driver - increased emphasis on education programs in such areas as pedestrian safety, bicycle safety, the needs of the older driver, seat belt usage and drunk driving will increase public awareness of actions that must be taken to address these safety issues

4. enforcement - aggressive enforcement of DWI laws, speed limits, pedestrian, bicycle and seat belt laws, and increased use of vehicle safety checks can contribute substantially to improved transportation safety

Increased Truck Inspections Two issues facing the trucking industry are violations of driving regulations and the safety of trucks on the road.

The FHWA authorized Mn/DOT to use federal truck safety funds to utilize State Patrol aircraft to help apprehend trucks attempting to avoid safety checks.

Last November, Minnesota instituted an enhanced truck safety program. This program includes a statewide truck air surveillance program and periodic saturation truck inspections. Both the air surveillance and the saturation inspection programs are in partnership with the Minnesota Departments of Transportation (Mn/DOT) and Public Safety (DPS).

The truck air surveillance program, the first of its kind in the country, was the result of a meeting with Gene McCormick, Deputy Administrator of the Federal Highway Administration (FHWA).

We have also established a truck safety "hot-line" for citizens to report suspected truck safety violations and joint truck inspections with neighboring states.

Work Zone Safety

Work zone safety is another important part of Minnesota's comprehensive highway safety program. More than 35% of Minnesota's roads are over 50 years-old. This combined with increased traffic and heavier trucks has resulted in deteriorated road which need significant repair and reconstruction. Unlike the major construction activities of the past, maintaining today's highways requires that the roadways remain open to the travelling public while the work activity is underway.

Mn/DOT has full time Work Zone Safety Coordinators in the Central Office and each of the 8 Mn/DOT districts in the state.

Working closely with contractors, construction, maintenance, and traffic engineering and communications personnel, Mn/DOT has develop an extensive year-around work zone safety public awareness campaign.

An aim of the program is to assist in establishing uniform work zone traffic controls for all highways in the state regardless of governmental jurisdiction.

In addition, Mn/DOT is working with the American Traffic Safety Service Association (ATSSA) to certify traffic control supervisors in 1990. A complete quality assurance program is being developed that includes all necessary standards and guidelines, training and the development and implementation of

state-of-the-are traffic controls to assure that proper work zone safety controls are used on all projects.

A four part public education work zone safety package is also being developed which includes:

A. K-6 Awareness Activities

B. Transportation Education in Social Studies, grades 7-12

C. Beginning Drivers Training

D. Defensive Drivers Training with emphasis on Mature Drivers

A Federal-State-Local Partnerships

In closing I want to emphasize the importance of the federal-state-local partnership in transportation safety. Federal efforts such as the "402" safety program have provided benefits far beyond the modest expenditures made under the program. The data analysis, engineering studies and analyses, technical guides, workshops, seminars, safety training, and vehicle and driver safety programs carried out by "402" funding has had a far-reaching impact on state and local highway safety efforts.

The Hazard Elimination Program has saved thousands of lives by providing special funding to make necessary improvements at high accident locations.

The Rail-Highway Crossings Program has helped to focus attention on a critical national issue and need. Public concern about the safety of rail-highway crossings was very evident at the transportation safety forums conducted throughout Minnesota last fall.

A continuation of the very fruitful federal-state-local partnership in transportation safety is essential to continued safety improvement during the 1990's and beyond. It is important that I publicly commend the outstanding help we have received from the Federal Highway Administration. In particular, I wish to acknowledge the close federal-state relationship we enjoy in Minnesota under Charles Foslien, FHWA Division Administrator.

The American Association of State Highway and Transportation Officials (AASHTO), in their recommendations on the future direction of the federal surface transportation program, strongly support continued federal involvement in highway and transportation safety. AASHTO's recommendation is that, "The safety of Americans, using the surface transportation facilities and services, should be preserved and enhanced through the continued national commitment to safety research, safety applications and safety projects".

I wholeheartedly concur in the recommendations made by AASHTO.

Thank you for this opportunity to present the views and recommendations of the Minnesota Department of Transportation on

this most important issue, Mr. Chairman. I will be pleased to respond to any questions you might have.

STATEMENT
ADVOCATES FOR HIGHWAY AND AUTO SAFETY
Before Hearings of the
House Public Works and Transportation Committee
Surface Transportation Subcommittee
March 22, 1990

Presented By Co-Chairs
Gerald L. Maatman, President, Kemper National Insurance Companies
and
Joan Claybrook, President, Public Citizen
accompanied by
Judith Lee Stone, Executive Director

Mr. Chairman, I am Gerald L. Maatman, President of Kemper National Insurance Companies, and Co-Chair of Advocates for Highway and Auto Safety, a new coalition of consumer, safety and insurance organizations formed six months ago to promote passage of highway and auto safety laws and policies to reduce death and injury on America's highways, and economic losses due to motor vehicle crashes. Advocates is working at the federal, state and local levels to improve highway safety and we have a strong interest in seeing the highway program reauthorization emphasize the importance of tougher laws and other programs for safer highways.

With me today is Joan Claybrook, former National Highway Traffic Safety Administration (NHTSA) Administrator and President of Public Citizen and my co-chair of Advocates, and Judith Lee Stone, its executive director. Joan and I will share the presentation of this testimony; we'll summarize its key points, and ask that the entire statement be inserted in the Record.

Advocates has identified a number of critical issues to advance highway and auto safety in the coming decade, and we are developing and implementing strategies to address them. Many of these problems for which we seek solutions will be permanently affected by the highway bill to be shaped this year and next in this committee. Our safety list includes the following:

- Drunk driving countermeasures, including passage of administrative license suspension laws in the states without them (currently there are twenty eight with such laws), open container laws and promotion of roadside sobriety checkpoints.

- Occupant protection legislation, including passage of safety belt use laws in states without them (33 states and D.C. currently require use); upgrading existing laws to provide for primary enforcement and more and better protection for children, both in child safety seats and safety belts; and better education about and promotion of air bags, now standard equipment on the driver side in increasing numbers of cars, and when used with safety belts provide the best overall motor vehicle occupant protection. We know state laws increase restraint use. Belt use has climbed from 12 percent to 48 percent since the first use laws were passed in 1984 and now are saving 4500 lives annually. Child restraint use has grown from 10 percent to 80 percent since the first law was passed in 1977 and now are saving 250 lives annually.

- Adoption of motorcycle helmet use laws, covering riders of all ages. Three states have recently reenacted use laws which experience almost 100 percent compliance and reduce deaths and head injury by at least 25 percent. We support motorcycle helmet and safety belt use legislation sponsored in the Senate by Senator Chafee (R-RI), and in the House by Representative Cooper (D-TN); we no longer can afford lack of uniformity in state use requirements in these two important safety areas.

- A return to the national maximum speed limit of 55 miles per hour (this law saved at least 25,000 lives between 1974 and 1986 according to the National Academy of Sciences); increased enforcement of all speed limits; a ban on radar protectors in both trucks and passenger cars; and promotion of responsible advertising on the part of auto manufacturers that does not glorify fast and powerful cars and driving practices.

- Renewed emphasis by the federal government (particularly the Federal Highway Administration) on remedies for high accident locations, specifically by increasing tough enforcement of existing standards followed by the states for roadway appurtenances, such as guardrail ends. There is need for FHWA to ensure that the states implement uniform, and high, safety standards, and to improve worker and motorist safety by using high-standard equipment in construction areas already open to traffic.

- Opposition to wider, longer and heavier commercial motor vehicles, and to their access to additional roads; and support for more effective truck braking systems, including more widespread installation of anti-lock brakes in big trucks.

- More funding and other support for enhanced traffic safety law enforcement.

- Additional funding and emphasis on research, development and demonstration for highway safety programs, across-the-board.

- Quick and effective promulgation of new federal motor vehicle safety standards (FMVSS) to improve side impact passenger protection, to upgrade all standards to apply to vans and light trucks, and to improve child restraint, pedestrian and rollover crash protection standards. We also support reauthorization of the National Highway Traffic Safety Administration (NHTSA) motor vehicle safety program; S 673 has passed the Senate, and lies dormant in the House.

Advocates participates in an informal group of organizations who are particularly interested in broadening and strengthening highway safety in this legislation, and who are developing consensus around certain principles. All are in agreement that the highway safety program of the 1990's and beyond must build on the progress of the past 25 years, take advantage of changed public attitudes demanding more safety in both cars and roads, and expand levels of funding and technological support, if we are to make further progress. Indeed, we will have to do all of this, just to keep the numbers of fatalities and serious injuries due to motor vehicle crashes at current levels, much less lower them. Corresponding societal and economic costs -- such as hospital and other medical costs, short-term and long-term rehabilitation, Medicaid and other government support programs,

insurance, even lost years of productivity -- will escalate further, adding to budget deficit burdens, in the absence of more aggressive pursuit of preventive highway safety measures.

Over 45,000 people are killed each year on our highways, and hundreds of thousands more injured. Our nation is paying an enormous, unnecessary price in dollars, family tragedy and lost productivity. Therefore, our consensus group is in agreement that:

- The successful federal/state/local partnership for highway safety, through the highway Trust Fund, be continued, and funding for its major grant and research and demonstration programs be substantially increased. These include the Section 402 State and Community Highway Safety Grant program, both Sections 408 and 410 alcohol safety incentive grant programs, Section 403 research and demonstration programs, the federal highway safety construction grant programs (Hazard Elimination and Rail-Highway Grade Crossing), and the federal motor carrier safety grant programs (Motor Carrier Safety Assistance Program and Commercial Driver Licensing).

- Existing federal highway safety incentive grant programs (sections 408 and 410) aimed at curbing drunk driving, should be combined into a single program and expanded to address occupant protection, speed and other priority safety issues.

- Additional emphasis should be placed on the need for accelerated research and supporting data collection (and its analysis and dissemination) regarding types and severity of crashes, injuries and fatalities, in order to assist in better problem identification of new vehicle, roadway driver behavior safety standards.

Mr. Chairman, at the beginning of a new decade, and approaching what is potentially a far more complex, dangerous and expensive new century, we have several options in the highway safety field. One option that Advocates has chosen is to lobby aggressively for tough, strong, and effective laws and regulations that serve as the foundation for society's efforts to save lives and prevent costly injuries. We know such laws and other policies are even more fully effective when combined with highly-visible police enforcement and public education and publicity about safety enforcement, and we know the general motoring public is supportive of such public health and safety activities.

Highway and auto safety has come "of age" in recent years, and it can no longer be said these are "motherhood and apple pie" issues. Some motor vehicle manufacturing leaders are marketing safety now, and other industries recognize that they can no longer afford not to require safety belt use of their employees, or not to install air bags in their vehicle fleets. Victims who have survived crashes, or have lost loved ones in a crash, dramatically demonstrate the needless nature of lost lives and crippling injuries, and teach us that such a high price need not be paid. Motor vehicle crashes are costing us too much money, their high numbers are classified as a major public health epidemic, and we all have a responsibility to ourselves and the nation to further institutionalize the known preventive vaccines.

We urge you, this committee and this Congress, at this critical point in the life of the federal highway program, to consider increasing resources at all levels for highway safety. Since passage of the federal highway and motor safety acts in the late sixties, we have learned that investments in successfully designed program standards to avoid crashes, and to protect highway users, should

a crash occur, are necessary, possible, and cost-effective. They have prevented hundreds of thousands of lost lives and injuries. This fact -- that highway safety should be a clear and major priority in our nation's transportation system -- is recognized and highlighted throughout other efforts to prepare for reshaping the highway program.

It is quite clear that this is not the time to pull back, or even to accept the status quo for highway safety, if we are to build on our knowledge of how to successfully prevent death and injury on the highway. These programs need significant boosts in funding and increased emphasis within the overall highway program. Such an investment now will reap benefits well into the next century.

COUNTY HIGHWAY DEPARTMENT
DOUGLAS COUNTY, MINNESOTA
P. O. BOX 398
ALEXANDRIA, MINNESOTA
56308

March 17, 1990

STATEMENT BEFORE THE

SUBCOMMITTEE ON SURFACE TRANSPORTATION

OF THE HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

RELATING TO TRANSPORTATION SAFETY

THURSDAY, MARCH 22, 1990

SUBMITTED BY:

ERNEST L. OLSON, P.E.

COUNTY HIGHWAY ENGINEER
DOUGLAS COUNTY, MINNESOTA

CURRENT SECRETARY-TREASURER
NATIONAL ASSOCIATION OF
COUNTY ENGINEERS (NACE)

TELEPHONE (612) 763-6001

AN EQUAL OPPORTUNITY EMPLOYER

Mr. Chairman, I am Ernest Olson, a County Highway Engineer from West-Central Minnesota and a member of the Minnesota Transportation Alliance, which was formerly known as Minnesota Good Roads, Inc. Thank you for the opportunity to appear before this Subcommittee.

County Government is an active particiapant in the Minnesota Department of Transportation effort to maintain and improve Minnesota's success in the area of highway safety. Local highway safety improvement programs have been funded with a combination of local, state, and to a greater extent, federal safety funds. The success of these programs is the direct result of the favorable local-state-federal working relationship we have in Minnesota. Examples of our accomplishments may help to emphasize the real need for continued federal financial participation:

Douglas County, Minnesota, has been able to install automatic signalized railroad-highway crossing protection at two locations with a third crossing scheduled for this spring. Seven additional grade crossings have been identified as critical locations needing improved protection. The hazards of unprotected railroad grade crossings were mentioned repeatedly at the series of public transportation safety forums recently held throughout the State of Minnesota. It is a tragic reality because of funding constraints, that crossing improvement priorities are driven by accident-fatality rates.

In the early 1980's the Minnesota Department of Transportation (MnDOT) spent nearly $5 million of federal aid off-system safety funds to improve regulatory and warning signs on the road systems of Minnesota's 87 counties and also in cities having a population of 5,000 or more. This signing project generated a lot of interest in upgrading township signing.

Early in 1986, MnDOT developed a Local Government Off-System (Township) Signing Program to help correct regulatory and warning sign deficiencies. The purpose of this traffic safety program is to make federal safety funds (Hazard Elimination Safety, HES) available to local road authorities to bring regulatory and warning signing on local roads and streets into compliance with the Manual on Uniform Traffic Control Devices. A single project is developed for each county under the administration of the county engineer. In 1987, Governor Perpich accepted a national safety award from the Federal Highway Administration in recognition of Minnesota's efforts to improve signing. To date, 70 of Minnesota's 87 counties are participating with a total of $10.2 million in Federal Safety Funds allocated for this program.

Minnesota's bridge repacement program is another example of the accomplishments which can be achieved with the local-state-federal partnership. Fortunately, Minnesota has had a Bridge Inventory System in place since 1967 and we were ready when special federal bridge replacement funds became available in 1975. Since that time, federal funds in excess of $111 million have been a major factor in the replacement of 4,000 plus deficient structures on the county and local road systems. Unfortunately, Minnesota still has more than 4,000 structures which are considered deficient by federal criteria. There are several emerging issues that will significantly impact and most likely add to the cost of Minnesota's bridge needs (all systems) in the next twenty years. These issues include truck weight increases, revised rating standards, ability of local units of Government to meet growing bridge replacement needs and decreasing availability of Federal Discretionary Bridge Replacement dollars.

We urge the members of this Subcommittee and your colleagues in Congress to keep the transportation needs of local government in mind as you consider new federal transportation legislation. It has been said, with substantial documentation, that "America Runs on Local Roads". Federal Aid Secondary Funds, Federal Aid Bridge Replacement Funds and Federal Aid Safety Funds have been a vital part of local road improvements in the past. Given our aging infrastructure, increasing traffic volumes on all highway systems, and increasing truck weights, it is absolutely critical that adequate federal funds be provided to preserve the tried and proven local-state-federal transportation partnership.

In closing, Mr. Chairman, I wish to call your attention to an attachement to the written copies of my remarks which have been provided to this Subcommittee. This attachment states the position of the National Association of County Engineers (NACE) on the future of the Federal Surface Transportation Program. This position paper expresses the concerns and suggestions of NACE for the role of the federal government regarding local transportation issues in the so-called post-interstate era.

I feel honored for the privilege to appear before this Subcommittee and thank you for your attention and consideration. I would be pleased to respond if there are any questions.

Statement before the U.S. House of Representatives Subcommittee on Surface Transportation, Hearing on Highway Safety Issues Including Speed Limit Monitoring

Brian O'Neill, President

March 22, 1990

INSURANCE INSTITUTE FOR HIGHWAY SAFETY

1005 N. GLEBE ROAD, ARLINGTON, VA 22201 (703) 247-1500

The Insurance Institute for Highway Safety is a nonprofit research and communications organization, supported by the nation's property and casualty insurers, that identifies ways to reduce motor vehicle crashes and crash losses. I'm the Institute's president and, at this subcommittee's request, I'm here to discuss highway safety issues with special emphasis on speed monitoring programs.

When speed limits were being raised from 55 to 65 mph on rural interstate highways in 40 states, proponents of this action painted a rosy picture. They said motorists were so frequently exceeding 55 that we had become a nation of lawbreakers. They said 65 would correct this situation so that, almost overnight, we would become a nation of law abiders. Proponents of 65 further argued that motorists had already chosen the speeds they felt safe and comfortable driving, so there wouldn't be any safety consequences of raising speed limits.

Travel Speeds Are Up

But has this happened? No. We now have nearly three years of data about the effects of raising speed limits to 65 mph. What we've found is that many motorists are driving faster now, and higher speed limits are being routinely exceeded -- not exceeded by as many motorists as ignored 55 mph speed limits, but exceeded by plenty of motorists to ensure that our highways are less safe now than they used to be.

For example, the percentage of cars exceeding 65 mph on Virginia's rural interstates nearly doubled (32 percent to 58 percent) from immediately before to immediately after speed limits were raised in July 1988. Now three of four passenger cars are exceeding 65. The proportion exceeding 70 mph also doubled right after speed limits were raised (8 percent to 17 percent) and then increased again during the first year of the higher limits. Now one in three cars is exceeding 70 (figure 1) on Virginia's rural interstates. In neighboring Maryland, meanwhile, speed limits on rural interstates are still 55 mph, and the proportion of cars exceeding 70 mph has not shown an upward trend.

New Mexico raised speed limits to 65 mph in April 1987 -- it was the first state to do so -- and, during the following 27 months, the proportion of cars exceeding 70 mph on New Mexico's rural interstates increased nearly fivefold.

Some proponents of higher speed limits point to data indicating that average travel speeds have increased only slightly since speed limits were raised. But we at the Institute believe it's more appropriate to focus on the increasing proportion of cars traveling at excessive speeds -- 70 mph and faster -- because this is the source of most of the increased risk.

The Institute's most recent surveys of travel speeds involve about 37,000 observations of free-flowing traffic on rural interstate highways in eleven eastern states during late 1989 and early '90. Six of these states (Connecticut, Maryland, Massachusetts, New Jersey, New York, and Pennsylvania) still have 55 mph maximum speed limits posted on their rural interstates, and five (New Hampshire, Ohio, Vermont, Virginia, and West Virginia) have adopted 65. What we've found is that the percentage of cars exceeding 70 mph is much lower in the states with the lower speed limits (figure 1). For example, 10 percent of cars on Pennsylvania's rural interstates, where speed limits are still 55, exceed 70 mph, while nearly three times that proportion are exceeding 70 in Ohio, where the speed limit has been raised to 65 mph.

Some states have posted 65 mph speed limits on rural interstates for cars only. Truckers are still supposed to adhere to 55 -- a policy that has some effect on travel speeds. In California and Illinois, for example, where differential speed limits are in effect, 3 to 4 percent of trucks are going faster than 70 mph. But in Arizona and Iowa, where speed limits are posted at 65 mph for cars and trucks, the percentages of tractor-trailers exceeding 70 mph are much higher -- 14 percent in Arizona, 9 percent in Iowa.

Rural Interstate Deaths Up, Too

A wealth of new research thus establishes that motorists do go faster when speed limits

are raised. Some go a whole lot faster -- increases in speeds faster than 70 mph are especially dramatic -- and the unfortunate result is an increase in highway crash deaths and injuries. Specifically, deaths increased 34 percent in 1988 on rural interstates posted at 65 mph, compared with deaths on the same roads during 1982-86. Deaths increased only 4 percent during the same time period on roads other than rural interstates in the same 38 states. Some of these increases occurred because of increased travel and, possibly, other factors. But studies by the U.S. Department of Transportation as well as the Institute estimate that the increase in deaths on rural interstates during 1988 that can be attributed to the higher speed limits is between 20 and 30 percent (figure 2).

Sixty-five mph speed limits caused more than 700 additional deaths on rural interstates during 1987-88 in the states that raised their speed limits, according to Institute research. Only on rural interstates are we seeing this kind of jump in deaths.

It's clear, then, that something needs to be done to control excessive travel speeds. The question is, what'll work to accomplish this? We encourage the federal government to set compliance requirements for the states to enforce whatever speed limits are in effect. But, at the same time, the formula that's adopted for this compliance program ought to be not only effective in encouraging enforcement but also as fair to one state as another.

Establishing a Speed Compliance Formula

The compliance formula now under consideration would require collecting data on the percentages of vehicles exceeding specified speed thresholds (55, 60, 65, 70 mph, etc.) on different road types (55-mph interstate highways, 65-mph highways, and 55-mph noninterstates). For each road type, the percentages of vehicles in each speed category would be weighted: Faster speeds on 55-mph noninterstates would get the most weight, because high-speed travel on these roads is particularly hazardous, while going a few miles an hour faster than the speed limit on 55 mph interstates would get the least weight. Such a formula would thus appropriately reflect different levels of speed violations on different road types.

Each state's compliance score would be obtained by taking the weighted results for each road type and combining them to reflect the mix of mileage traveled on each kind of road within the state. A state's score would then be compared against a baseline score for the same state in order to determine compliance. (Compliance data would be gathered in each state during fiscal 1990 and from the data a baseline score would be established. In subsequent years, each state would be allowed 110 percent of its baseline score before federal-aid highway funds would be reduced.) The problem is, this plan could tempt states to abandon speed enforcement during the baseline year -- inviting, in effect, a year of lawlessness -- so that compliance in subsequent years would be easier to achieve.

The way to solve this problem is to establish a compliance formula that uses national rather than state averages for miles traveled on different road types. This way, compliance could be assessed among the states -- something that's not possible under the proposed plan. Using a national formula that's standardized for road mix would also avoid favoring states where much of the mileage traveled is on congested roads with limited opportunities for speeding.

Whatever compliance formula is ultimately adopted should be heavily weighted toward drivers going faster than 70 mph. Why? Because these are the riskiest drivers. They're exceeding even the design speeds of most U.S. rural interstate highways -- and the design speed is the one that should not be exceeded even under the most favorable conditions. The compliance formula presently under consideration is based on percentages of drivers exceeding established speed limits, whatever they are, but at the same time the formula correctly recognizes that a motorist going 61 mph on a rural interstate highway posted at 55 mph, for example, poses a lesser risk than a motorist going 71 mph on a rural interstate posted at 65. Both drivers are exceeding the speed limit -- and they're exceeding it by the same amount -- but they don't pose an equal risk. This aspect of the compliance formula should be retained because it's the one that encourages states to curtail the fastest drivers.

Other Ways to Reduce High-Speed Crash Deaths, Injuries Needed

Now that high-speed driving has increased on many U.S. roads, it may be a difficult and long-term process to put the cork back on the speed bottle. Enforcing speed limits will help -- in fact, it's essential -- but we've also got to look for other ways to prevent high-speed crashes from resulting in highway deaths and injuries. We've got to implement measures to increase safety belt use, for example. Right now, use is generally at or below 50 percent, even in states where safety belt laws are on the books.

Part of the problem is that so many U.S. safety belt laws provide only for so-called "secondary" enforcement, which limits police authority to stop and ticket motorists for failure to buckle up. Of the 33 belt laws now in effect in the United States, only seven provide for "primary" enforcement, which means police may issue tickets solely for failing to use belts. In the other 26 states and the District of Columbia, where primary enforcement isn't allowed, police have to stop motorists for other violations before they can enforce the safety belt law. Clearly, we need more primary laws.

We also need publicity and enforcement of safety belt laws to achieve use rates of 80 percent or more. This doesn't mean we need a police state with motorists getting tickets right and left. What we need are strong safety belt laws on the books. And then we need police -- and motorists -- to take these laws very seriously, as seriously as more and more motorists now are taking drinking-and-driving laws.

Only a few years ago, many people thought driving while a little over the legal alcohol limit was acceptable behavior. But now driving while impaired by alcohol has become socially unacceptable to most people. We have to develop the same overall attitude about speeding that we have about impaired driving. It's widely recognized, for example, that even drivers who've consumed only moderate amounts of alcohol have slowed reaction times and other impairments that increase their chances of being in a crash. Although speeding doesn't impair skills like alcohol does, it reduces the time drivers have to avoid crashes. So the effect of driving fast is similar to alcohol impairment -- it

increases both the likelihood of crashing and the severity of crashes that do occur.

Our collective conscience still hasn't yet grasped that driving at high speed is an unacceptable risk -- a risk in the same league as drinking and driving. Both cost lives. Both are against the law. Both are subject to uniform legal limits. Yet driving while impaired is treated as a serious problem while speeding all too often is thought of as O.K. if you can get away with it. So, while we're trying to come up with a fair and effective speed compliance formula for the states, let's also remember this: Speeding, like impaired driving, ought to be unacceptable, not just under the law but also according to social mores.

INTERNATIONAL ASSOCIATION OF CHIEFS OF POLICE

POLICE

SINCE 1893

The International Association of Chiefs of Police is a professional organization comprised of over 14,500 top law enforcement executives from the United States and 76 nations. IACP members lead and manage several hundred thousand law enforcement officers and civilian employees in international, federal, state, and local governments. Members direct North America's largest police departments including New York City, Los Angeles, Toronto, Chicago, Detroit, Montreal, and Houston, and head the national police forces of Israel, Denmark, the Phillipines, Korea, and Liberia, among others. Thousands of suburban and rural police agencies throughout the world are also represented.

Since 1893, the IACP has facilitated the exchange of important information among police administrators and promoted the highest possible standards of performance and conduct within the police profession. This work is carried out by functionally oriented committees consisting of police practitioners with a high degree of expertise that provide contemporary information on trends, issues, and experiences in policing for development of cooperative strategies, new and innovative programs, and positions for adoption through resolution by the association.

Throughout its existence, the IACP has been devoted to the cause of crime prevention and the fair and impartial enforcement of laws with respect for constitutional and fundamental human rights.

COLONEL ELMER H. TIPPETT

Biographical Sketch

Colonel Elmer H. Tippet was born in Washington, D.C. and raised in Prince George's County, Maryland. He was appointed to the Prince George's County Police Department in March, 1966 after completing a tour of duty with the United States Army. He became a Detective, assigned to the Vice Squad in 1971 after serving in the uniform patrol force. Colonel Tippett's supervisory career began in 1973 with his promotion to Sergeant, Homicide/Sex Section, Bureau of Criminal Investigation. His varied career included serving as Executive Assistant for Chiefs of Police and Chief of the Bureau of Support Operations. In January, 1986 Colonel Tippett was appointed Deputy Chief of Police, Chief, Bureau of Operations, assuming responsibility for the day-to-day direction of all operational functions of the Prince George's County Police Department. Colonel Tippett retired from the Prince George's County Police Department in November, 1987 after twenty-one years of service, when he was appointed Superintendent of the Maryland State Police by Governor William Donald Schaefer.

Colonel Tippett holds a Bachelor's Degree in Administration of Justice from the American University, Washington, D.C.

He lives in Laurel Maryland, is married, and has three children. He belongs to several law enforcement organizations and is the recipient of numerous awards and citations.

TULSA
IACP 1990

Good morning Chairman Mineta. It is a pleasure to be here today. I am Elmer H. Tippett, Superintendent of the Maryland State Police. Today I am representing Superintendent Thomas A. Constantine, General Chairman of the State and Provincial Police Division of the International Association of Chiefs of Police. We have surveyed our members, state by state, concerning the new speed compliance formula -so that we could accurately represent the feelings of state law enforcement agencies. Our members are clear:

> The IACP Highway Safety Committee and the S&P Division continue their strong support of the National Maximum Speed Limit concept through enforcement and education, but we also continue our strong opposition to the federal monitoring/sanctions process.

38-258 O—91——47

We feel that monitoring speed, as with the NMSL, will improve safety, but in an ironic twist, the monitoring/sanctions process causes reductions in highway funds allocated to the states, which, in effect, results in a negative safety impact by deferring necessary highway improvements. In states where compliance figures are satisfactory, often times this is because other safety priorities such as DWI and drug interdiction are relegated to secondary and tertiary priority. Thus, we in law enforcement are in the classic Catch-22. If we don't comply, safety is negatively impacted because our funds are reduced. If we comply, safety is negatively impacted because other priorities are reduced. Its hard to see how we can win this one, Gentlemen.

Allow me to expound briefly on our position.

Police executives know that many factors contribute to fatal and injury vehicle crashes in this country. Primary known causes are speed, drunk and drug driving and other hazardous moving violations. Speed, therefore, cannot be looked upon as the sole

issue but only a part of a complex puzzle. Therefore, speed enforcement is a top priority, but it is only one component of a total, comprehensive highway safety plan. This compliance program does not recognize overall safety efforts, and, by reducing funds, would reduce the highway improvement and safety projects that a state could undertake. The speed monitoring formula and the corresponding sanctions tend to create a traffic enforcement program that is not properly balanced. Limited resources and other critical factors, such as the national proliferation of narcotic trafficking, complicates an administrator's responsibilities of assignment and prioritization, especially when examining the factors influencing traffic accidents.

Although it is true that the "states' rights" argument can be manipulated for many purposes both legitimate and otherwise (and certainly has been in the halls of the U.S. Congress) there are sound reasons to conclude that an issue such as this one, practically, should be a state determination. It goes without saying, that geographically,

commercially, economically, and traffic-wise, states are different. For example, the term "noninterstate road" encompasses a wide range of realities- the accident records of an urban freeway and a two-lane rural road are probably quite different. Under the compliance formula, these roads are treated equally. Some of the data elements in the proposed formula may be determined by a small volume of vehicles in a given category and, therefore, subject to large, year to year fluctuations. A state could go in and out of compliance because of random variations. It appears to many of our members that the formula will favor the urban states with high vehicle miles traveled; it appears to some that the formula will favor states which have a poor history of compliance. Whatever your interpretation of the formula, one thing is clear: no plan will adequately represent all of the states equally, because of the inherently different situation of each case. So, the main argument for "states' rights" in this case is simple: the state roads and traffic are very different.

<u>That sanctions have been designated as the way to approach this problem does not</u>

seem totally warranted by the information. The U.S. General Accounting Office has found little relationship between the current federal compliance requirement and the level of a state's highway safety or enforcement efforts. Honestly speaking, we all want the highways funds, and speed is a top priority for all of us in state police agencies, but in the final analysis, we do what we have to do, to make the best use of the limited resources we have, and to protect and aid our citizenry. We ultimately answer to our state constituency.

State police executives have historically stated that the use of sanctions for non compliance are dysfunctional because of essence it reduces the amount of money available for traffic safety. This can only lead to a downward spiral of even non-compliance, less money and increased sanction. On the other hand, incentive base rewards for compliance, would lead to a reduction to fatal accidents. This would lead other states to see the financial benefit of compliance and reduced fatals and over a

period of time have a significant effect on the fatal accident rate for the country.

There are several specific comments our members have made about the formula which we would like to share with you:

1. If a base index value is used, it should be based on a 3-5 year measurement/observation period and not on a single year. If the base year is, for whatever reason, nonrepresentative of the state's average traffic volume or speed compliance level, the state could find itself in noncompliance due solely to the statistical aberration. We would, therefore, recommend that the base "state score" be the average of no less than three, and not more than five, consecutive years.

2. The formula focuses on fixed speed levels, rather than the variability of speed.

3. It was fairly difficult for many of our members to evaluate the formula because much of the data is not currently collected. Estimating the state compliance scores is difficult because the data is not currently gathered for these speed ranges.

Gentlemen, I can only reiterate our support for the concept of a national maximum speed limit and our opposition to the federal monitoring/sanctions program. I have attached to my testimony a copy of our resolution concerning this issue. I think the resolution speaks for itself. Thank you for allowing us the opportunity to address you on this issue. I would be happy to respond to any questions.

MAXIMUM SPEED LIMIT SANCTIONS

WHEREAS, a national maximum speed limit has always been supported by state law enforcement agencies and should continue to be encouraged on roads where it is appropriate; and,

WHEREAS, the federal speed monitoring program is inequitable because states have widely varying road systems and monitoring is not consistent among the states. This calls into question whether there is a consistent basis for sanctioning one state vs. another' and,

WHEREAS, federal sanctions are counterproductive to improving highway safety. They reduce the number of highway improvements and safety projects that a state can undertake; and,

WHEREAS, the U.S. General Accounting office has found little relationship between the current federal compliance requirement and the level of a state's highway safety or enforcement efforts; and,

WHEREAS, sanctions also force the over-concentration of limited resources for the express purpose of attaining compliance rather than application of resources in a manner most effectively enhancing total highway safety; and,

WHEREAS, the U.S. Department of Transportation has testified before Congress that the sanction/compliance process should be repealed; and,

WHEREAS, the U.S. Congress is now considering a revised compliance formula for both 55 and 65 MPH speed limits, now therefore be it,

RESOLVED,that the Division of State and Provincial Police of the International Association of Chiefs of Police urges the U.S. Congress to abolish the present and proposed federal requirements relating to monitoring and sanction provisions of the national maximum speed limits, and be it further,

RESOLVED, that incentives, rather than sanctions, would more effectively promote improvements in highway safety; and be it further,

TULSA
IACP 1990

RESOLVED, that a copy of this resolution be transmitted to the Majority and Minority leaders of the U.S. Senate, the Speaker of the U.S. House of Representatives, and to appropriate commitee chairmen and other members of Congress.

SUBMISSIONS FOR THE RECORD

CENTER FOR AUTO SAFETY
2001 S STREET, NW SUITE 410 WASHINGTON, DC 20009 202•328•7700

FEDERAL-AID HIGHWAY ACT SAFETY PROVISIONS

1. INTERSTATE SAFETY EMPHASIS PROGRAM.

SUMMARY: PROVIDES FOR SYSTEMATIC UPGRADING OF GEOMETRIC DESIGN AND TRAFFIC CONTROL DEVICES OF RURAL INTERSTATE HIGHWAYS POSTED AT 65 MPH IN ORDER TO REDUCE FATAL AND INJURY ACCIDENTS.

Problem: Rural Interstate highways and other freeways/expressways that are posted at 65 mph have produced disproportionate and unacceptable increases in fatalities and injuries over the past few years.

Legislative response: Assuming that the 55/65 mph law remains unchanged, some reasonable countermeasures need to be implemented in statute that will ameliorate the highway losses that are being sustained on the 65 mph posted Interstates and freeways.
An Interstate Safety Emphasis Program needs to be put into operation that requires each state that has posted, or intends to post, any qualifying highway at 65 mph to undertake a reconstruction or rehabilitation project that will elevate the alignment, cross-section, and traffic engineering features of the highway to the highest feasible level of state-of-the-art design.

Overall upgrading of the governing design and operating features of the highway will advance highway safety by providing wider lanes and shoulders, better design speeds with improved sight distance, better entrance and exit ramp geometry, better skid resistance, larger and brighter signs and other state-of-the-art traffic control devices and pavement markings, and safety appurtenances that would respond to the needs of the entire range of vehicle sizes and types (bridge railings, barriers, and impact attenuators that will contain and redirect heavy trucks, etc.). These improvements will enhance the capability of the highway to accommodate elderly drivers with slower perception-reaction times and vehicles with inferior performance, especially large trucks.

These projects must therefore be executed to the highest geometric and traffic engineering design principles that are achievable, and each proposed project must be approved by the FHWA. In addition, these projects must be designed, bid, and let in as short a time as possible and will be funded by a required expenditure of part of each state's annual I-4R apportionment. We recommend a minimum of 5% and a maximum of 20% of annual I-4R funds as a mandated range within which each state with 65 mph highways shall fund ISEP projects. When a state demonstrates that its remaining ISEP work falls below the minimum required fiscal year amount, it may be granted an exemption from the

minimum expenditure.

A certification statement and accompanying documentation must be supplied each fiscal year by each state that verifies that it has spent dedicated I-4R ISEP funds within the mandated range for ISEP work. Also, each ISEP project must be reviewed at completion by the FHWA in coordination with each state highway department in order to confirm that the highest feasible state-of-the-art design features were incorporated in accordance with the Federally approved PS&E, before FHWA approves the project for payment of the Federal share.

2. INTERSTATE MANAGEMENT PROGRAM.

SUMMARY: PROVIDES FOR A COMPREHENSIVE, FEDERALLY APPROVED MANAGEMENT APPROACH TO THE QUALITY AND SAFETY OF THE ENTIRE INTERSTATE SYSTEM BY REQUIRING EACH STATE TO HAVE AN APPROVED INTERSTATE MANAGEMENT PROGRAM THAT ENCOMPASSES MAINTENANCE, PAVEMENT, HIGHWAY SAFETY STRATEGIES, AND THE USE OF IMPROVED INTERSTATE DESIGN STANDARDS AS A CONDITION FOR THE USE OF I-4R FUNDS.

Problem 1: The current Interstate maintenance guidelines are weak and ineffectual. No performance standards for pavement durability, skid resistance, traffic control device condition and performance, and many other operational characteristics of the Interstate system are contained in these maintenance guidelines.

Legislative Response: In the post-construction Interstate era, Congress should require a unified, comprehensive management process for all aspects of the Interstate system, including pavement design and renovation strategies, maintenance calendars and procedures, and high geometric standards as described in the following section under Problem 2. Such a comprehensive Interstate Management Program (IMP) should couple the Interstate

aspects of the states' comprehensive Bridge Management Systems, Pavement Management Systems, and Highway Safety Management Systems with superior design standards that will achieve substantial increases in operating safety, and with Interstate maintenance standards that determine the procedures, intervals, and performance standards for both remedial and preventive maintenance. Such Interstate maintenance standards within a comprehensive Interstate Management Program would ensure durability and improved safety that will increase the cost-effective use of I-4R funds. These maintenance standards and the comprehensive Interstate Management Program model should be established by notice-and-comment rulemaking to become effective no later than two years following the enactment of a reauthorization bill. Congress should charge the Secretary with instituting Federal procedures for the approval of each state's submitted IMP and each state shall have an approved and implemented IMP no later than four years following the enactment of the bill. The Secretary shall perform an annual comprehensive review at the end of each fiscal year of the adequacy of each state's approved IMP and shall report his findings to Congress by March 31 of the following year. The Secretary's review shall include, but not necessarily be limited to, the evaluation of each state's effectiveness in implementing high design standards

on each I-4R project to ensure improved safety, durability, and capacity; of its success in coordinating and implementing the maintenance, bridge, highway safety, and pavement management elements of its comprehensive IMP; and the extent to which the state's use of a comprehensive IMP has improved the cost-effective use of Federal I-4R funds.

Comment: There is no essential reason why a revamped I-4R approach could not be entered under the heading of an Interstate Management Program. Furthermore, the requirement of applying improved Interstate standards for I-4R work produced by the Secretary and the need for a comprehensive management process that emphasizes rational, cost-effective strategies for maintenance that are coordinated with I-4R projects, could be effectively linked to the receipt of I-4R funds. I-4R project PS&E evidencing the use of the improved standards generated by the Secretary's rulemaking plus an approved IMP could be required as a condition for using I-4R funds. The Secretary can be directed to withhold approval of any I-4R PS&E unless the state has an approved IMP.

Problem 2: The newly revised AASHTO Interstate design policy currently in FHWA rulemaking, is an attempt to introduce

extraordinary flexibility into the design parameters for the Interstate system. The basic design values for both reconstruction and R-R-R work allow any existing designs to be deemed acceptable for Federal assistance. In addition, the maneuver of the first page of the policy on R-R-R standards is to allow state design discretion to control completely in the use of I-4R funds and thereby to eliminate the Federal approval role.

The Center filed detailed line-by-line comments demonstrating both the safety shortcomings and the political motives behind this policy. The fundamental defect of the document is that it cannot ensure that higher quality, better safety, and a more uniform driving environment will emerge through the use of its low design values. FHWA cannot demonstrate that the statutory goals of 23 U.S.C. Sec. 109(a) can be met through the obligation of Federal I-4R funds for projects designed in accordance with these standards. The use of the lowest design values and engineering practices allowed by the policy would produce obsolete facilities.

The drive of the new policy is to predetermine, along with other recent regulatory initiatives, a fait accompli regulatory environment for the administration's legislative scenario that proposes a reduced Federal role and increased state flexibility. The Interstate standards approach is one of a number of instances

where the agency and the states are exercising their discretion in an area where the Federal-aid Highway Act is silent in order to realize particular political and fiscal goals.

Legislative response: Congress should direct the Secretary to establish through notice-and-comment rulemaking, standards for the reconstruction, resurfacing, restoration, and rehabilitation of the Interstate system that will, as much as is feasible, increase its uniformity of design and its safety to the maximum extent and accommodate both current and probable future traffic needs. The Secretary must also be directed to establish procedures for the review and approval of all I-4R projects by the FHWA to meet these goals of uniformity, safety, and mobility.

Comment: The statutory command to the Secretary to establish such optimal Interstate standards should be coordinated with the ISEP initiative in No. 1, supra, so that non-65 mph Interstates are also assured of significant safety upgrading through the use of superior design standards. If, arguably, an ISEP is required in each state, a significant disparity in quality and safety could be produced between superior ISEP 65 mph posted Interstates and all 55 mph posted Interstates whose designs would be subject to the extremely wide ranges of alignment and cross-section

values of the AASHTO document.

3. PAVEMENT MANAGEMENT PROGRAM.

SUMMARY: PROVIDES FOR A REQUIRED, FEDERALLY-APPROVED COMPREHENSIVE PAVEMENT MANAGEMENT PROGRAM IN EACH STATE THAT INTEGRATES STANDARDS FOR PAVEMENT PERFORMANCE LIFE, DESIGN, RESTORATION STRATEGIES, AND MAINTENANCE TECHNIQUES WITH SKID RESISTANCE SAFETY NEEDS BASED ON THE STANDARDS ISSUED BY THE SECRETARY PURSUANT TO THE RECOMMENDATIONS OF A NATIONAL ACADEMY OF SCIENCES STUDY.

Problem 1: FHWA completed a rulemaking action in early 1989 to require each state to formulate a Pavement Management System (PMS) in four years that "is acceptable" to the FHWA.

The final rule is exceptionally weak and does not protect the Federal interest in ensuring that only long-lived, durable pavement with good surface safety properties will be subsidized with Federal funds. Much inferior pavement has been laid at preponderant Federal expense over the last fifteen years under the R-R-R approach and this policy cannot ensure that durable, safe pavement will be used in every instance by each state in its application of Federal funds.

Here are the main features of the pavement policy Final Rule, with special concentration on the character of the PMS

the agency is requiring of the states:

* No initial performance period specified for new and fully reconstructed Federal-aid (FA) pavement.

* No Federal specifications for type selection and design of new, reconstructed, or rehabilitated pavements.

* Thirty-year pavement analysis period deleted in Final Rule; any analysis period is a product of negotiation between each Division Administrator and his state.

* Interstate and Federal-aid Primary major arterials have only an 8-year performance requirement for rehabilitation pavement, with exceptions allowed.

* Minor arterials and collectors have only 5-year performance period for rehabilitated pavement.

* Economic analysis of alternative actions for design of minor rehabilitation projects deleted from Final Rule.

* No specific skid resistance Federal minimum standards for new and maintained pavement surfaces - only one hortatory sentence in Final Rule.

* No prohibition of use of polish-susceptible aggregates in Final Rule.

* No requirement for skid testing in Final Rule.

* Final Rule excludes pavement design and type selection from PMS. State highway departments can use any pavement design

procedures it chooses.

* PMS not required to be formalized or written.

* PMS to be "operational" in 4 years, but meaning of 'operational' is unspecified - changed from 'implemented' in NPRM.

* PMS can be any approach found "acceptable" to FHWA (although NPRM required "approval" by FHWA, states objected and so FHWA changed to "found acceptable"). No management criteria on how Division Administrators will operationally define 'acceptable'.

* PMS can contain any management processes states are currently following. FHWA is not requiring any specific elements or format to be used in any given state's PMS.

* Final Rule eliminated proposed requirement of system inventories of pavement design and condition as basis of a good PMS.

* User costs first excluded from definition of 'life cycle costs' and then life cycle costs requirement as part of PMS eliminated from Final Rule.

The upshot of this "regulation" is a complete lack of nationally uniform pavement design parameters, of minimum initial performance periods for new and reconstructed pavements laid at preponderantly Federal expense, and of Federal controls over the

quality of skid-resistant pavement surfaces. This policy does not require any changes in state designs, type selection, or current performance quality of new and reconstructed pavements either in durability or in skid resistance.

Legislative response: As in the case of comprehensive Bridge Management Systems (BMS), Congress should direct the Secretary:
- to require comprehensive PMSs for all states, to become effective contingent upon explicit FHWA approval no later than three years after the enactment of the reauthorization bill.
- to establish through notice-and-comment rulemaking, pavement life performance standards for new and fully reconstructed pavement and to review the need to establish longer pavement life cycles for rehabilitated pavement on all of the FA systems.
- to create through notice-and-comment rulemaking, an appropriately specific PMS model for emulation by the states that will be used as the basis for FHWA approval of a state's PMS. This should include, but not necessarily be limited to, Federal specifications for type selection and design of new, reconstructed, and rehabilitated pavements; specific analysis periods; system inventories of pavement design and condition, particularly for the purpose of being used as the basis for cost-effectiveness choices for pavement renovation; the inclusion of

user costs as part of life cycle costs; a requirement for systematic skid testing; economic analyses of alternative approaches for the design for all Federally assisted pavements; and maintenance performance criteria and strategies. The provision and/or legislative history should make clear Congressional intent that any approved comprehensive PMS should effectively integrate design, type selection, and construction/reconstruction/rehabilitation methods with maintenance calendars, strategies, and techniques. The Secretary shall perform an annual review at the end of each fiscal year of the adequacy of each state's approved PMS and report his findings to Congress by March 31 of the following year.

Problem 2: No performance standards for skid-resistance on Federal-aid Highways exist in Federal regulation. The only guidance for the states is a single-sentence exhortation that all Federal-aid projects shall have a skid-resistant surface. Many states do not lay pavement with adequate long-term skid resistance. Some states use polish-susceptible aggregates with FHWA Division office approval that quickly wear to low skid numbers, especially for wet weather conditions. Some states do no routine skid number testing on their highways and some states

do not even own skid trailers to make skid tests. The NTSB has severely criticized the lack of uniform skid resistance criteria for the Federal-aid program and the commensurate lack of Federal maintenance standards for holding skid resistance levels to minimum acceptable conditions. A Center petition for rulemaking was granted, but the rulemaking process was terminated following the Advance Notice of Proposed Rulemaking because of strong opposition by the states to any standards of any kind for skid resistance.

Legislative response: The National Academy of Sciences shall conduct research into the requirements for skid-resistant pavement surfaces on highways and streets. The results of such research, together with the National Academy's recommendations, shall be provided to the Secretary no later than two years following enactment of this bill and shall form the basis of proposed rulemaking by the Secretary to establish nationally uniform standards for instituting and maintaining highly skid resistant pavement surfaces on all Federally assisted highways and streets, such standards to become effective no later than September 30, 1995.

4. HIGHWAY SAFETY MANAGEMENT PROGRAM SUMMARY: PROVIDES FOR A UNIFIED HIGHWAY SAFETY IMPROVEMENT PROGRAM THAT COMBINES THE GOALS OF THE CATEGORICAL SAFETY CONSTRUCTION PROGRAMS WITH THOSE OF SEC. 402 BY INTEGRATING SAFETY WORK WITH REGULAR AUTHORIZATION PROGRAM R-R-R PROJECTS. CREATES A COMPREHENSIVE HIGHWAY SAFETY MANAGEMENT PROCESS REQUIREMENT FOR EACH STATE THAT MUST BE APPROVED BY THE SECRETARY. ALSO REQUIRES FEDERALLY PRESCRIBED IMPROVED ROADSIDE SAFETY AND SAFETY APPURTENANCE DESIGN STANDARDS, UNIFORM TRAFFIC CONTROL DEVICE STANDARDS ISSUED AND AMENDED BY THE SECRETARY, AND NEW FEDERAL STANDARDS FOR SIGN LEGIBILITY.

Problem 1: The safety categorical programs have failed to accomplish the extent and consistency of safety improvements that are needed on existing roads. The reasons for this failure are numerous.

First, the categorical programs have not been coordinated in statute or in state highway department practice with the regular construction programs. This lack of coordination has become even more evident and acute with the advent of non-Interstate R-R-R work.

Second, the states have used the money for "pet" projects whose cost-effectiveness has been suspect. For example, one

state used all of its allotted funds in one fiscal year to perform nothing but intersection signalization work.

Third, the failure of Congress to direct compliance with the Act by the Secretary by providing him with explicit enforcement powers has led to manifold abuses of Secs. 130 and 152. For example, some states still do not have FHWA-approved highway safety improvement processes for all aspects of the programs 17 years after their inception. In other instances, many states have not conducted the comprehensive engineering survey of all hazardous locations, do not have a priority listing for correction, and perform specious before-and-after evaluations of project effectiveness.

Fourth, the programs have suffered because Congress allowed R-R-R work to proceed under reduced design principles without an explicit understanding of the need to enhance operating safety on older roads in specific ways. Not only were basic safety improvements not accomplished in R-R-R projects, but in many states safety construction categorical work was programmed for projects after a R-R-R project had been completed.

This inordinately wasted Federal funds in a number of ways: safety work that could have been performed more efficiently and economically was performed ex post facto, and, if done at all, was often grafted onto a highway that had received only

resurfacing with a short-lived, thin overlay. Other important safety work that the road needed badly was not accomplished by the R-R-R project and the cross-section, alignment, and some roadside environment improvements were outside the scope and the funding of the safety construction project. The result was systematic safety needs not accomplished under R-R-R -- and, indeed, they still are not -- and not accomplished under the safety construction programs. Safety fell through an enormous crack.

Lastly, safety suffered because the scope of the categorical safety construction programs was so narrow that it made them inherently vulnerable to low, and continually reduced, funding. "Safety" was ghettoized in narrowly-focused, low-funded programs and the regular authorization programs began to concentrate on R-R-R work which overwhelmingly had pavement renewal as its theme.

Legislative response: The safety construction categorical program approach must be interpolated into a much wider safety countermeasure effort in the Federal-aid Highway Act that mandates the states to engage in safety construction work as part of their project requirements in performing R-R-R work. Each state must have a comprehensive highway safety management program which is approved by the Secretary and modelled on the management

principles and requirements enunciated in the governing policy produced by the Secretary through notice-and-comment rulemaking, such policy to be implemented no later than two years following enactment of this bill. (This approach can therefore also encompass the goals of the Sec. 402 program.) Such principles and requirements shall include, but not necessarily be limited to: provisions for an effective record system of accidents; adequate accident investigations to determine the probable causes of accidents, injuries, and deaths on all Federal-aid highways; geometric design and traffic control standards that can ensure the highest feasible levels of operating safety; provisions for work zone safety; roadside and highway safety appurtenance design standards that ensure the highest feasible levels of safety for single-vehicle accidents; the safety elements of maintenance and bridge management programs; skid resistant pavement design; a system for evaluating the safety cost-effectiveness of projects completed with funding under this section; and other such principles and requirements for areas of management, design, and operation as the Secretary shall deem necessary and proper.

A comprehensive safety management process in each state will require a safety needs review of each project programmed for construction, reconstruction, or R-R-R and the selection of the

most cost-effective safety countermeasures. The safety needs review would comprise geometric design, roadside safety, and traffic engineering needs, and the judgment of how extensive the corrections should be, given available funding, must be founded on preliminary systemwide safety needs reviews. This is necessary in order to avoid piecemeal decisionmaking on an ad hoc, project-by-project basis.

The systemwide reviews would list all hazardous locations, both potential and those verified through accident experience, and establish a priority schedule for correction that calendars safety improvements on projects planned for pavement renewal and increased capacity. Notwithstanding any other provision in this section or in the Act, however, if a state's safety review demonstrates a need for a specific safety countermeasure that is not part of a regular project for the reconstruction, resurfacing, restoration, or rehabilitation of any Federally assisted highway, funds authorized under this section may be used for such project.

No project for any purpose receiving Federal assistance will be approved by the Secretary unless it is designed pursuant to a fully approved state Highway Safety Management Program (HSMP) and is therefore a product of the decisions made on the basis of an existing systemwide safety review and a project-specific safety

needs evaluation.

For the purpose of establishing a comprehensive Highway Safety Management Program, carrying out both systemwide and project-specific safety reviews, and correcting hazardous conditions as part of a regular reconstruction, resurfacing, restoration, or rehabilitation project, or as an independent hazard elimination project, including the installation, retrofit, replacement, or repair of traffic control devices and their supports, safety appurtenances, barriers, railings, parapets, impact attenuators, and correction of other hazardous conditions, the Federal share payable shall be 90 percent of the cost.

The Secretary shall perform a comprehensive review at the end of each fiscal year of each state's approved HSMP and shall report its findings to Congress by March 31 of the following year. The Secretary's review shall comprise, but not necessarily be limited to, an evaluation: of the effectiveness of each state's safety needs reviews; of the safety countermeasures performed as an integral part of each reconstruction, resurfacing, restoration, and rehabilitation project; of the quality and reliability of the safety effectiveness evaluations performed by each state following completion of each project; and of the overall level of safety benefits achieved through the projects of the previous fiscal year.

Problem 2: The Roadside Design Guide currently in FHWA rulemaking was authored jointly by FHWA and The American Association of State Highway and Transportation Officials (AASHTO). The Guide contains no mandatory standards, is intended as a guide to be used completely at the discretion of the practitioner, and allows both unsafe and untested devices and practices to be used on Federal-aid projects. The roadside design safety principles will be pivotal to the quality of safety decisions and designs for projects programmed in accordance with the requirements of the Highway Safety Management Program. Therefore, it is crucially necessary to improve this document substantially and elevate it to the level of standards.

Legislative response: Apart from other sections of the new authorization bill that direct the Secretary to establish principles and standards for the states' management of maintenance, bridges, and pavement, the Secretary is also directed to establish through notice-and-comment rulemaking, crashworthiness performance criteria for all highway roadside design features, including the nature and extent of the clear zone, drainage structures and slopes, traffic control devices and their supports, barriers, bridge railings and parapets, and impact attenuators, such standards to be made effective no later

than September 30, 1993. The goal of such standards shall be to provide the highest feasible levels of crash performance in order to reduce both fatalities and injuries and their severity as much as possible.

Problem 3: The Federal Highway Administration has proposed repeatedly to relinquish its stewardship over and publication of the national standards for traffic control devices presently contained in the Manual on Uniform Traffic Control Devices (MUTCD) for Streets and Highways. In addition, the agency has considerably slowed its amendment of these standards. The MUTCD is not being updated in a timely manner so that the revision of its standards and practices afford practitioners state-of-the-art information to apply in the field. The last set of amendments were done in 1988. Lastly, many county, city, and even state roads and streets do not conform to the current standards in the MUTCD and therefore violate driver expectancies by installing unique or "maverick" devices. The FHWA does not attempt to enforce the provisions of the MUTCD off the Federal-aid systems of highways. No national uniformity of devices and practices in fact exists.

Legislative response: two changes are necessary, one in 23 U.S.C. Sec. 109(a) which establishes the Secretary's responsibilities in ensuring safe, durable, economical Federal-aid projects, and the other in Sec. 109(d) so that the scope of the standards for traffic control devices will be universal -- for all jurisdictions and for all roads and streets -- and the responsibility for issuing and revising the MUTCD resides exclusively with the FHWA. This will result in a substantial enhancement of traffic control quality on all roads and streets which will benefit all drivers, especially those who are elderly, vision-impaired, and with other physical incapacitations.

Amend Sec. 109(a) to add a subsection (3) as follows:

"(3) that conforms to the standards and practices for the design and use of traffic control devices promulgated by the Secretary, who is directed to approve only such installations as will promote the safe and efficient utilization of the highways."

Amend Sec. 109(d) to read as follows:

"(d) On any highway project, the location, form and character of informational, regulatory and warning signs, curb and pavement or other markings, other traffic control devices providing warning, delineation and channelization of traffic, and traffic signals installed or placed by any public authority or other agency, shall conform to the nationally uniform standards

38-253 O—91——48

and practices for the design, performance, and maintenance of such signs, markings, devices, and signals, as promulgated by the Secretary and promptly revised by him from time to time to accommodate the state of the art in traffic engineering and highway safety."

Comment: Neither of these provisions explicitly mandates statutory enshrinement of the MUTCD per se, an action which is arguably improper. However, they explicitly require the Secretary to create the appropriate uniform standards as a continuing Federal responsibility, to amend them in a timely manner, and to ensure that they apply to all streets and highways. Therefore, it is virtually certain the MUTCD would continue to be the vehicle through which the FHWA would generate, amend, and enforce such standards. It should be noted that a sustainable interpretation of these provisions is that the Secretary is authorized to produce and enforce traffic control standards that are not codified within the MUTCD.

Problem 4: The standards for sign legibility are patently inadequate, especially for the older driver whose average visual acuity will not allow adequate perception-reaction time, particularly under nighttime driving conditions, to perform many

driving maneuvers safely. The size of highway sign word message lettering needs to be increased to meet the needs of all legally licensable drivers. Although the FHWA is studying the need for revising legibility standards, largely in response to the Center's petition for rulemaking and the recent TRB report on the needs of elderly drivers, it has established no timetable for action. There is every reason to believe that the agency will not act on this topic until the retroreflectivity rulemaking is concluded some years hence. This is an improper approach: standards for conspicuity and detection should be generated simultaneously and compatibly with legibility standards.

Brighter and larger signs would be a giant step in improving highway operating safety. Without a statutory mandate and a time certain calendar, the agency will temporize on establishing standards in both areas because of the burdens for the states.

Legislative response: Congress should direct the Secretary to propose rulemaking that would establish revised legibility standards for signs that will accommodate all licensed drivers, including the elderly and other motor vehicle operators with diminished visual capabilities. These standards must be appropriately coordinated with any standards adopted by the agency for minimum maintained levels of retroreflectivity. This

rulemaking should be concluded with standards to take effect in a time certain that is asserted in the Act. In order to alleviate the cost burdens, the legislative history accompanying the provision should make clear that the Secretary is authorized to require compliance in a series of stages within the statutory timeframe. The timeframe asserted in the provision proper will have to be fairly generous, i.e., something in the range of 5 years or more for full compliance.

5. BRIDGE MANAGEMENT PROGRAM.

SUMMARY: PROVIDES FOR A REQUIREMENT THAT EACH STATE HAVE A COMPREHENSIVE BRIDGE MANAGEMENT SYSTEM APPROVED BY THE SECRETARY AND BASED ON A MODEL PRODUCED BY SECRETARIAL RULEMAKING THAT APPROPRIATELY INTEGRATES THE DECISIONMAKING PROCESSES OF SUCH TOPICS AS REPLACEMENT AND RESTORATION STRATEGIES, MAINTENANCE FORECASTING AND STRATEGIES, INSPECTION INTERVALS AND TECHNIQUES, AND OPERATIONAL SAFETY NEEDS.

Problem: Although comprehensive bridge management systems (BMS) are badly needed in the states, FHWA's response in April 1988 to the study requirement in the 1987 STURAA advocated a laissez faire Federal approach to BMS requirements. The agency conceded the shortcomings of the states by asserting that only half of the states had written procedures for determining priorities in selecting bridge projects. In addition, only 33 states had master plans for rehabilitating their on- and off-system bridges; and few states had a priority selection process that took preservation activities into account in a systematic way. The agency went on to describe, as we had demonstrated for years, many current state management efforts as informal, loosely coordinated, and both subjective and intuitive.

Many bridge programs are still run by a seat-of-the-pants approach, with virtually complete reliance for the operation of a bridge program on the personal skills and idiosyncratic memories of a few key personnel. There is often no communication between different sections of the bridge department, such as between design and maintenance, and no cost-effectiveness selection criteria worth the label for bridge replacement, reconstruction, rehabilitation, and maintenance.

FHWA in its report views a comprehensive BMS as comprising the following elements:

* Has a suitable data base.

* Incorporates analytical tools for objectively assessing bridge needs.

* Fully integrates all decisions and activities relating to bridges, including design, programming, maintenance, rehabilitation, and replacement. For example, a comprehensive BMS would rationally link maintenance strategies and techniques with rehabilitation and replacement choices.

* Incorporates procedures for assessing the trade-offs and implications of present actions and policies on long-term needs.

* Provides a system-wide perspective to complement the project perspective. The system-wide perspective would provide the proper basis for prioritizing project selections.

Despite these clear delineations of need in the content of BMSs for the states, FHWA nevertheless recommended in its study conclusions that Congress not mandate BMSs for the states, nor that minimum Federal requirements for their content be determined by FHWA. This position was thoroughly a product of the states' lack of enthusiasm for the comprehensive BMS concept. When FHWA performed a survey of the states' interest in having comprehensive BMSs, only two states asserted that they were committed to formulating and applying them. The majority of responses characterized their states' attitude towards BMSs as only mildly interested or, in some cases, as uninterested. The bulk of the uninterested or mildly interested responses were the states with the poorest records of bridge maintenance, National Bridge Inspection Standards compliance, underwater inspections, and demonstrated cost-effective use of Federal bridge funds.

Legislative response: Congress must require all states to have comprehensive BMSs no later than 4 years following enactment of the new authorization bill. The comprehensive BMS for each state must be formalized, written, subject at all points to explicit approval and modification by FHWA, and appropriately representative of a comprehensive BMS model that Congress directs the Secretary to establish through proposed rulemaking, the final

rule to become effective no later than one year following enactment of the reauthorization bill. Since many counties and cities use Federal funds on their bridges, Congress should direct the states to ensure that all jurisdictions which accept Federal assistance for the inspection, replacement, and rehabilitation of their bridges shall have BMSs.

Congress should also make clear its intent that FHWA ensure that the BMS in each state include alternative strategy evaluation for each bridge project, systemwide analysis of design choices, systemwide based cost-effectiveness selection criteria, priority ranking for rehabilitation and replacement, the specification of rigorous inspection criteria and intervals (especially for in-water bridge supports), maintenance performance goals and procedures, and maximum attention in project design to consequent operational safety needs. It is crucially important that these controlling features be itemized in the statute. If they are not, the agency will tend to reproduce its recent impotent rulemaking policy on Pavement Management Systems (q.v., supra, pp. 10-12).

Furthermore, legislative history should make it clear that Congress expects that the basic Federal policy apparatus controlling the national bridge inventory, inspection, and replacement/rehabilitation effort be subjected to notice-and-

comment rulemaking. Apart from the NBIS of 23 CFR Pt. 650, none of the other documents governing the national bridge program are amended in the sunshine, including the Standard Bridge Specifications, Maintenance Manual for the Inspection of Bridges, Bridge Inspector Training Manual, and the Recording and Inventory Guide. All of these have been, and prospectively will be, revised by FHWA in concert with AASHTO without public rulemaking unless Congress directs to the contrary.

The Secretary is directed to perform a comprehensive review at the end of each fiscal year of each state's comprehensive BMS which shall appropriately assess, among other things, the effectiveness of each state's BMS in establishing bridge maintenance, rehabilitation, and replacement needs through systemwide priority scheduling; the effectiveness of maintenance strategies and techniques, and their integration with bridge rehabilitation and replacement; the timeliness and effectiveness of bridge inspections, including, in particular, underwater inspections; and the effectiveness of alignment, cross-section, safety appurtenance, and traffic engineering strategies to improve operating safety. The Secretary shall report the results of such comprehensive reviews to Congress no later than March 31 of the following year.

6. HIGHWAY MAINTENANCE MANAGEMENT PROGRAM.

SUMMARY: PROVIDES FOR A NATIONAL ACADEMY STUDY OF MINIMUM MAINTENANCE PERFORMANCE STANDARDS AND OF THE ELEMENTS NECESSARY FOR COMPREHENSIVE MAINTENANCE MANAGEMENT SYSTEMS IN THE STATES.

Problem : The states have chronically undermaintained their Federally assisted highways and much R-R-R work performed until recently was due to persistent deferral of routine and preventive maintenance, a state obligation under 23 U.S.C. Sec. 116, in favor of qualifying for Federal assistance under the revised definition of construction in 23 U.S.C. Sec. 101(a). The GAO has criticized the states' maintenance practices on a number of occasions over the past fourteen years and the specific lack of any clear Federally-established standards for adequate maintenance for the states to abide by. The GAO is currently investigating the states' maintenance practices and policies.

The cost-effective use of scarce Federal dollars requires vigilant oversight by the states of maintenance needs on Federal-aid roads and timely maintenance actions so that capital needs for more extensive reconstruction and rehabilitation projects do not have to come into play any sooner than necessary. The states and the FHWA have resisted all efforts to establish Federal

maintenance performance standards and Federal criteria for state maintenance management systems.

A substantial portion of the annual maintenance review findings of each FHWA Division has been devoted to serious safety-related maintenance deficiencies, such as unrepaired and deteriorated barriers, impact attenuators, and breakaway supports; degraded, illegible signs, faded markings, and damaged traffic control devices; edge-of-pavement dropoffs; right-of-way violations on Interstates; and severe pavement deterioration including spalling, ravelling, shoving, etc., and poor surface skid resistance.

A study provision in the 1987 STURAA (H.R. 3129, Sec. 159) required the Secretary to enter into appropriate arrangements with the National Academy of Sciences to conduct a complete investigation of the appropriateness of establishing minimum Federal guidelines for maintenance of the Federal-aid primary, secondary, and urban systems similar to those established for the Interstate System. The Secretary was directed to report to Congress on the results of the investigation and study along with any recommendations, not later than 180 days after the date of enactment of this Act. However, according to the Program Management Branch of the Construction and Maintenance Division of the Office of Highway Operations of FHWA, three successive budget

requests from U.S. DOT for this and two other studies were denied by Congress and, to date, nothing whatever has been done to carry out the study mandate of the section. Therefore, House Public Works will have nothing before it as an assessment of Federally-created maintenance principles for non-Interstate Federally assisted highways. It can surmised, however, that the results of such a study might well have been similar or identical to the recent FHWA bridge management study which the Center also sponsored (Sec. 158), that concluded that comprehensive bridge management systems are needed in the states, but that Congress should not mandate them and no fundamental content of the systems should be required by FHWA. Furthermore, the Center does not believe that "guidelines" would be successful in curtailing maintenance abuses by the states, including systematic deferral of routine maintenance, but, rather, that standards of minimum performance are necessary for improved maintenance by the states and for Federal assessment of maintenance adequacy.

Legislative response: First, the National Academy of Sciences should independently carry out a study of the need for fundamental minimum maintenance performance standards for the non-Interstate Federal-aid systems, to be concluded and provided to the Secretary no later than eighteen months after the

enactment of a new authorization bill. This study shall form the basis for proposed rulemaking by the Secretary to establish such minimum maintenance performance standards to become effective no later than one year after his receipt of the National Academy study.

Second, the National Academy of Sciences, in appropriate consultation with the FHWA and the states, should study the need for the states to conduct their maintenance activities under a comprehensive maintenance management system. Legislative history could suggest that such a comprehensive maintenance management system would presumably encompass such features as systemwide pavement needs, riding surface adequacy, shoulder integrity, drainage needs, vegetation control, traffic control device and pavement marking cleaning and repair, and the maintenance of roadside and appurtenance safety conditions. The system would contain analytical tools and decision mechanisms for determining the most timely and cost-effective techniques for maintaining these areas and would also feed into the other major program areas of the state highway department involving design, programming, and the choice of reconstruction and R-R-R strategies.

The existing subsections (a), (b), and (c) of Sec. 116 should be replicated in a new bill to continue the states'

responsibilities and the Secretary's enforcement powers.

Comment: This legislative approach avoids the serious defects in charging the Secretary with carrying out a study with the assistance of the National Academy. When a study is charged exclusively to the National Academy, it is always carried out expeditiously by reliance on the annual operating budget for the Transportation Research Board. When the study is placed under U.S. DOT authority, it is only performed pursuant to specific earmarked funding. If that funding is not forthcoming, the agency in many cases is only too happy to avoid the multiple burdens of conducting the study and reporting results to Congress that may be viewed unfavorably by the states.

It also needs to be pointed out here that it would be preferable to sponsor the creation of a Federal model for maintenance systems for the states that would be as comprehensive and coordinated as those described elsewhere in these pages for the Interstate system, bridges, pavement, and highway safety. However, unlike these other areas, the states have full funding responsibilities for regular highway maintenance and it can be argued that a mandated Federal model and subsequent FHWA approval of each state's maintenance management system would constitute an unwarranted Federal intrusion.

As against this, it can be argued that the Federal government has a legitimate interest in the cost-effective maintenance of facilities built and renovated with Federal funds because of the need optimally to protect the Federal investment and to increase the service lives of those facilities through judicious maintenance strategies in order to forestall the need for Federal reinvestment in reconstruction and R-R-R work.

Nevertheless, at the present time it is difficult to argue for a legislative response that goes beyond a study provision.

7. HIGHWAY WORK ZONE SAFETY PROGRAM

SUMMARY: PROVIDES FOR IMPROVED WORK ZONE SAFETY BY ENHANCING THE QUALITY AND EFFECTIVENESS OF TRAFFIC CONTROL DEVICES, SAFETY APPURTENANCES, TRAFFIC CONTROL PLANS, AND BIDDING PRACTICES FOR TRAFFIC CONTROL DEVICES AND SERVICES. REQUIRES FEDERALLY APPROVED SYSTEMS OF TRAINING AND CERTIFICATION FOR WORK ZONE SAFETY PERSONNEL RESPONSIBLE FOR IMPLEMENTING AND OVERSEEING TRAFFIC CONTROL AND OPERATIONAL SAFETY. REQUIRES COLLECTION AND ANALYSIS OF APPROPRIATE WORK ZONE ACCIDENT DATA AND ADEQUATE FEDERAL OVERSIGHT OF WORK ZONE SAFETY PRACTICES IN THE STATES. REQUIRES AN ANNUAL REPORT TO CONGRESS ON THE SUCCESS OF THE STATES' EFFORTS UNDER THIS SECTION.

Problem 1: Need specification in Fed-aid Hwy. Act of:

- character of signing and other traffic control devices in work zones;
- pavement marking practices in work zones;
- crashworthiness of traffic control devices and safety appurtenances.

Legislative response: "(a)(1) Signs, and other temporary and permanent traffic control devices and markings, used to inform,

warn, and guide motorists through the work zone, shall be as bright, conspicuous, and legible as is feasible under both day and night operating conditions. Such signs, devices, and markings shall provide the guidance and the legible symbol and word messages that meet the needs of older drivers and other vehicle operators with diminished capabilities. (2) The Secretary shall establish, through proposed rulemaking, nationally uniform standards for the conspicuity and legibility of signs and other traffic control devices and markings to become effective no later than September 30, 1993.

(b) Each state highway department shall ensure that all work zones open to through traffic shall at all times have appropriate temporary pavement markings and other supplementary delineation of the safe travel paths through the work areas. Such markings and supplementary delineation shall, as much as feasible, replicate the state-of-the-art centerline and edgeline delineation of permanent roadways.

(c)(1) All work zone temporary traffic control devices shall be designed and deployed in a manner to reduce, as much as is practicable, the potential for vehicle impact and to minimize the threat of injuries to workers, pedestrians, and vehicle occupants. (2) All traffic control devices and their supports, as well as barrier systems and impact attenuators, shall meet

crashworthiness performance criteria established by the Secretary through proposed rulemaking, the final rule to become effective no later than September 30, 1993. The goal of such standards shall be to provide the highest feasible levels of crash performance."

Problem 2: Some states still using lump sum bidding for traffic control in work zones despite exhortation of 23 CFR Sec. 630.1010(c). This practice often underfunds adequate traffic control and the contractor has an incentive to reduce to a minimum his costs for temporary traffic control.

Legislative response: "(d) Each state highway department shall use unit pay items for providing, installing, moving, replacing, and maintaining traffic control devices and safety systems of barriers and impact attenuators."

Problem 3: Some states allow the use of inadequate TCPs, including single-sheet layout "typicals" for even major projects. Moreover, some states allow unreviewed contractor TCPs.

Legislative response: "(e)(1) A traffic control plan (TCP) shall be developed for each project and included in its plans,

specifications, and estimates. The degree of detail in each TCP shall be commensurate with the highest feasible level of safety in the work zone that can be achieved for motorists, workers, and pedestrians. Each TCP shall be consistent with the requirements of this section, including the regulations that the Secretary is directed to establish pursuant to subsections (a)(1) and (c)(2) as well as with all existing policies that the Secretary has promulgated which govern work zone safety. (2) All TCPs developed by highway contractors shall be approved by each state highway department and all Interstate 4-R project TCPs shall be directly approved by the Secretary."

Problem 4: No Federal standards of training and certification for work zone responsible person (cf., 23 CFR Sec. 630.1010(b)). Many states used poorly trained and unqualified personnel as on-site TCP and work zone safety overseers.

Legislative Response: "(f)(1) Each state highway department shall designate for each project a person trained and certified pursuant to subsection (2) who will have the authority and primary responsibility for assuring that the TCP and other safety aspects of the work zone are effectively administered, including the authority to stop work, if necessary, to ensure the safety of

motorists, workers, and pedestrians and the responsibility to record all motor vehicle accidents that occur in the work zone. (2) The Secretary shall establish through a proposed rulemaking, standards for the training and certification of the persons directly responsible for temporary traffic control and project safety in work zones, as set forth in subsection (a), such standards to become effective no later than September 30, 1993." [Legislative history should assert that these standards should be formulated and adopted with due regard to the current training and certification system operated by the American Traffic Safety Services Association and should be equivalent, or superior, to this current private sector system.]

Problem 5: Many states do not collect work zone accident data, or collect data that is inadequate and/or incomplete. Current work zone accident data reporting to the FHWA is voluntary and many states do not comply or send only partial data. The agency asks only for data from the Primary system. Without adequate accident data collected and reported, the FHWA and Congress cannot determine how well or badly the program is working.

Legislative response: "(g)(1) Each state highway department shall collect data on all work zone accidents occurring within

the state which shall include, but not necessarily be limited to, the type of accident in each instance, whether single- or multi-vehicle, and the nature and extent of the damage, injuries, or fatalities sustained; the age of the vehicle operator(s); the type of highway on which each accident has occurred; the type of work zone in which the accident has occurred (construction, maintenance, utility, etc.); and the length, duration, traffic volume, percentage of heavy trucks and other relevant design and operational characteristics of the work zone. (2) Each state highway department shall analyze and use work zone accidents and accident data to continually correct deficiencies in each work zone and to improve future TCPs. The results of such analyses shall be made available to the Secretary on a continuing basis. (3) Each state highway department shall organize these work zone accident data for each fiscal year in a format to be determined by the Secretary and shall send such data to the Secretary no later than December 31 following the close of each fiscal year."

Problem 6: FHWA must perform effective oversight of work zone safety practices in the states and report on the progress of the states to Congress.

Legislative response: "(h)(1) The Secretary is directed to conduct annual reviews of work zone safety, including on-site inspections of temporary traffic control conditions at selected sites in each state and a review of each state's TCPs and other work zone safety procedures and policies. (2) The Secretary shall also make an annual assessment, both state-by-state and on a national level, of the previous fiscal year's work zone accident experience in order to determine the effectiveness of each state's work zone safety practices. The results of such state-by-state and overall national inspections, reviews, and assessments shall be annually reported to the Congress by March 31 of each year."

Problem 7: An enforcement provision must be added which specifically charges FHWA with ensuring state compliance with this provision.

Legislative response: (i)(1) If any on-site inspection, TCP review conducted pursuant to subsection (h), or other information demonstrates inadequate traffic safety conditions in any highway project work zone, the Secretary shall promptly notify the state in writing to take immediate corrective action to conform its work zone traffic safety practices to the requirements of this

section and other applicable provisions of this Act and Federal regulations. (2) Any state that has been notified by the Secretary of deficiencies in work zone traffic safety shall: (A) correct all identified deficiencies on projects within five days of the receipt of such notice; (B) review all other similar projects in the state for comparable deficiencies and correct those deficiencies within ten days of the receipt of the notice from the Secretary; and, (C) certify immediately to the Secretary in writing that necessary corrective actions on all affected projects have been completed. (3)(A) The Secretary shall withhold final approval for projects in any state that fails to comply with any portion of subsections (a) through (h). (B) The Secretary shall withhold final approval for any project(s) under subsections (i)(2)(A) and (i)(2)(B) which has not been certified by the State in accordance with subsection (i)(2)(C). (4) The Secretary shall promulgate regulations to assure prompt and timely implementation of this subsection.

Problem 8: 23 U.S.C. Sec. 120(d) needs to be amended to provide encouragement to the states to utilize superior traffic control devices and safety appurtenances in order to reduce the serious losses now occurring in the nation's highway work zones.

Legislative response: "(d) The Federal share payable on account of any project for the elimination of hazards of railroad-highway crossings, as more fully described and subject to the conditions and limitations set forth in Section 130 of this title, and for any project for traffic control signalization or for pavement marking or for commuter carpooling and vanpooling or for installations of traffic signs, <u>or for temporary traffic control devices, markings, and safety appurtenances for guiding, warning, and protecting traffic, workers, and pedestrians in highway work zones</u>, highway lights, guardrails, or impact attenuators, may amount to 100 per centum of the cost of construction of such projects . . ."

POSITION OF THE NATIONAL ASSOCIATION OF COUNTY ENGINEERS ON THE FUTURE OF THE FEDERAL SURFACE TRANSPORTATION PROGRAM JANUARY 1990

The National Association of County Engineers (NACE) views the process of developing a comprehensive national program for the future of our transportation system as an important task. Counties own and maintain 1.7 million miles of roads or 43 per cent of the total mileage in the United States; 208,000 bridges over 20 feet or 51 per cent of the bridges on the National Bridge Inventory; and own or contribute funding to 25 per cent of the public transit systems. The role of the federal government in this post-interstate era will be a crucial one as those decisions made at the federal level will most certainly impact the mobility and funding questions county officials must address at the state and local level.

BASIC PREMISE

The 43,000 mile Interstate system will be completed in 1991. County officials have supported the construction and completion of this system which has been done almost entirely with federal funds. While NACE supports continued involvement by the federal government in funding some rehabilitation of this system, it is now time to allocate a greater portion of the resources of the federal highway trust fund to other systems. Not only must the federal government redirect its spending, it must increase its investment in transportation infrastructure. The National Council on Public Works has pointed out that federal investment peaked in the mid 1970's and has since declined. NACE has identified several areas which should be considered in making decisions on the future of our national surface transportation system.

URBAN/SUBURBAN CONGESTION

The movement of people, goods and services in urban and suburban areas is reaching a crisis stage. While it is a problem having national implications, congestion is a local concern whether it occurs on county or state roads or on an Interstate highway servicing an urban or suburban area. The Interstates, though constructed to link the nation with a good highway system, have become part of the local road network in many areas with 70 per cent of Interstate traffic now being local in nature. To the highway user it makes little difference who has responsibility for a highway system if that system is congested and not serving the needs of the local public and business community. A revised surface transportation program must consider the new development patterns in suburban counties and the implications of growth on the ability of citizens to move around with as few constraints as reasonably possible. Such a program must also address the needs of the older urbanized areas which have suffered population decline. These areas may have less ability to pay for improved roads and transit services. At the same time areas within them are experiencing revitalization and growth and thereby generating severe traffic congestion. Both highways and transit need to be considered as solutions.

Land use planning must be given a high priority as we devise new solutions and develop new programs to solve our growing congestion problem. We must also acknowledge congestion's contribution to a decline in air quality due to auto emissions. The deterioration of road surfaces and protection of our environment are issues which must be linked to future surface transportation policies.

RURAL ACCESS

Our nation's rural secondary highways have, for the last thirty years, received the least attention of any system. This is ironic for it was the rural farm-to-market system which was the initial reason for the federal government involvement in a national highway program. While basic maintenance has been, and should continue to be, the responsibility of local government, the federal role in construction and rehabilitation must grow substantially. The number and size of trucks and other heavy equipment using these roads has expanded substantially in the last twenty years. The decentralization of industry and commerce has generated substantial truck traffic in areas heretofore almost untouched. The abandonment of thousands of miles of railroad branch lines has caused a significant shift in the movement of agricultural products from rail to truck and has put heavy and frequent truck traffic on routes never envisioned or designed for such impact. This has increased the rate of deterioration of the secondary system and requires a substantially heavier investment for reconstruction to adequate standards than previously envisioned. Good secondary roads in rural areas provide access to Interstates and primary roads, and are key factors for our agricultural, logging, mining, manufacturing and tourism industries.

FUNDING

-The federal surface transportation program should be user fee-based to the greatest extent possible. The source of these user fees should continue to be the gasoline, diesel and special fuel taxes, and the various other vehicle related taxes.

-There should not be a turnback to the states of any of the existing federal gas tax authority.

-There is a substantial balance in the trust funds which should be spent down gradually starting immediately. In the future all trust fund revenues and accrued interest should be allocated in a manner reflecting the spirit and original Congressional intent which accompanied the establishment of the trust fund.

-All levels of government should increase funding for surface transportation programs and all revenues generated by taxes on motor fuels should be dedicated to transportation purposes.

-States and local governments which dedicate all motor fuel and related transportation tax revenues for transportation purposes should receive preferential treatment in the distribution of federal highway trust funds.

-The distribution of highway trust fund money to the FAS and FAU systems should be on a pro-rata lane mile basis regardless of jurisdiction.

-Local match requirements should not be punitive to the extent that "the rich get richer and the poor get poorer". It must be recognized there is a great variation in the ability of county governments either to raise or to impose additional taxes. There should be a way to evaluate the ability of a county to match and to adjust the required local match accordingly.

-The opportunities for local infrastructure financing through tax exempt bonds should be increased. This is an excellent federal revenue investment and encourages use of private capital in solving local problems.

PLANNING/DECISION MAKING PROCESS

Support for continuing and increased federal funding of surface transportation depends on a strengthening of the federal-state--local relationship. This is true particularly for the federal aid highway program which has not had adequate local government input. The vast amount of travel in this country is local in nature and the concerns which NACE believe need to be addressed in the post-interstate era, i.e. congestion, rural access, and economic development, require solutions which must involve local governments.

The states have traditionally been the focal point for most federal highway funds. It can be stated fairly that fifty different systems of funding and planning exist in terms of what approach states use in the allocation of federal highway funds. The future federal transportation program should not impose a uniform decision making process on all states. It should recognize the degree to which county road needs exist and that these needs must be addressed in an equitable manner. This necessitates that local government's needs are considered fully as priorities are established and that local officials are equal partners with state officials in the decision making process.

CATEGORICAL PROGRAMS

Interstate/Primary Program This program would provide federal funds to resurface and rehabilitate the systems as needed to maintain them in basically the same condition as when first constructed. Emphasis would be placed on those sections especially in urban and suburban areas where additional lanes and/or interchanges are needed to deal with increasing traffic and congestion problems.

Urban Highway Program
This program, previously known as the FAU or FAUS program, would provide federal funds to upgrade existing city and county arterials in designated federal urban areas. Upgrading of these routes whether on the state, county or city systems would be directed at solving congestion and mobility problems in urban areas and high growth suburban areas in such a way as to relieve congestion on the Interstate system.

States would administer the program in consultation with local governments and/or metropolitan planning agencies where appropriate, for urbanized areas between 5,000 and 200,000 population. Funds would be passed-through to counties and other local governments in areas above 200,000 population. The pass through concept is a key component of the future transportation program since counties are in an excellent position to understand and undertake surface transportation projects aimed at addressing the mobility concerns of their residents. Larger counties have both the planning and engineering expertise to carry out these projects without direct state highway department involvement. In states where local government has little or no highway responsibility, funds would be spent by the state after consultation with local government officials on project selection.

Rural Highway Program--This program would be directed toward the upgrading, through a substantial increase in funding, of what is now known as the Federal Aid Secondary program (FAS). It is essential that rural roads be improved so they can carry the much heavier loads of today's vehicles and so they can serve as a link to the Interstate system and to various markets for the agricultural, logging, mining, manufacturing, and tourism industries. The high

operating costs to these industries associated with poor roads, and in turn the cost to the economy as a whole, makes the condition of rural arterial roads a national responsibility.

This program could continue to be administered by the states provided there are strong guarantees of county input in the planning, programming, and project selection process in states where such input does not now exist, or is not now permitted. Another option would be for a consortium of rural counties to enter into an agreement which would allow them to receive funds directly from the federal government.

On roads assisted through this program that fall into a "low volume" category, it should be possible to permit somewhat lower design standards than those applied on the entire system.

Bridge Program--This program would be continued essentially in its present format except that increased funding should be provided if inspection records indicate such a need. Adjustments to permit a greater percentage to be spent for "off-system" projects in some states may be necessary, if inspections demonstrate such a need.

Mandates--While certain federal requirements are appropriate, others simply impose undue burdens on local governments and waste finite resources. There needs to be a differential in imposing design standards on lower volume roads. There needs to be a review of those non-transportation goals which are included in federal surface transportation programs. Federal requirements attached to highway and transit funding should be reviewed and reduced.

Safety--This concern needs to be factored into a future highway program. Clearly, deteriorating roads, deficient bridges, poor roadway design, and other factors create a safety problem on the nation's highway system. Another aspect of safety which should be addressed is to what extent the federal government will require local governments to allow large vehicles access to all roads.

Research and Development/Technology Transfer--There is an appropriate role for the federal government in this area. The federal government needs to be involved in developing new technologies for both highways and mass transit systems. With no manufacturers of rail cars left in the U.S. and the emergence of new transit technology such as magnetic levitation and linear propulsion systems, it is incumbent on the federal government to take a leading role in research and development in this field. In addition, the federal government should take a leadership role in providing up to date information on new technologies, management approaches, etc. to local government.

The evolution of the Technology Transfer (T^2) program during the last ten years has proven to be an excellent mechanism for transmitting rapidly expanding technological information to local government agencies. This program is vital to counties and should be continued as a totally federally funded program without the cumbersome necessity of local match participation.

Continued participation of local officials on T^2 advisory committees is of primary importance, so that the entire effort can be carefully focused on the particular needs of our counties.

ADDITIONS TO THE RECORD

STATEMENT BY REP. TONY P. HALL
ON REAUTHORIZATION OF SURFACE TRANSPORTATION ACT
SUBCOMMITTEE ON SURFACE TRANSPORTATION
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
MARCH 22, 1990

Mr. Chairman, I would like to commend you for holding these hearings on the reauthorization of the Surface Transportation Act, and the possible restructuring of highway and mass transit programs to meet our future needs into the 21st century.

A number of my distinguished colleagues from Ohio as well as our Governor, Richard Celeste, have testified on the importance of this issue to our State of Ohio. I would like to add my support for an integrated transportation system, one that gives a fair return to states that have paid more to the Highway Trust Fund than they have received in benefits. In addition, I would urge the Committee to design legislation that takes into account the transportation needs of low-income citizens in urban areas such as Dayton, the community I represent.

Like many metropolitan areas, Dayton has suffered its share of economic dislocation over the last twenty years. In the 1970s, we lost sixteen percent of our population and several of our major employers. Although the 1980s have brought some recovery, the future still remains tenuous. But one thing is clear-- without good roads and transit service, our ability to attract new employers, support productivity improvements, and help people who need jobs, will be in jeopardy. Good roads and transit are an essential part of our recovery program.

For this reason, Mr. Chairman, I join my colleagues from Ohio in supporting an increase in the Minimum Allocation funding from 85% to 90%. This change is expected to increase Ohio's Minimum Allocation by

approximately $27 million annually. I also endorse changing current law to allow Ohio access to discretionary transportation funding without having to return an equivalent amount of Minimum Allocation funds.

As the program now stands, discretionary transportation funds are now available to states that get the most from the Highway Trust Fund without penalty. But donor states, like Ohio, who already get a lower return on their highway tax contributions, cannot accept discretionary funding without loss of an equivalent amount of Minimum Allocation dollars.

I am proud to say, Mr. Chairman, that Ohio and its local communities have done their share in raising supplemental funding. Now it is the federal government's responsibility to make sure that Ohio's taxpayers get a fair return.

The Honorable Norman Mineta, Chair
Subcommittee on Surface Transportation
House Public Works & Transportation Comm.
Room 2165, Rayburn Building
Washington, DC 20515

Dear Representative Mineta:

Originally, we had planned to give oral testimony last week before the House Subcommittee on Surface Transportation. Since the time was short, we deferred to other groups, such as Scenic America and the National Trust for Historic preservation. I hope the enclosed memorandum will help you to reconsider the policies implicit in the Highway Beautification Act of 1965. Please contact us for any additional information you may need.

Sincerely,

Katherine E. Slaughter

RE: Reauthorization Of The Post-Interstate Surface Transportation Programs
Highway Beautification Act of 1965

DATE: March 22, 1990

Since its inception in 1986, the Southern Environmental Law Center has focused on four areas of environmental concern, one of which is billboard and sign control. Over the past four years we have worked with state and local governments, state and local organizations, and interested citizens to combat visual pollution on our interstates, federal aid primaries, and on state and secondary roads in both and rural and urban settings. In the course of our work, we have consulted with over 150 communities in the Southeast, Federal Highway Administration (FHWA) officials in the regional and Washington offices, and state and local environmental groups.

The public had perceived that the Highway Beautification Act of 1965 (HBA) would eliminate the visual pollution caused by

billboard on our highways. Thus, ordinary citizens have been shocked to learn that instead, more than 300,000 new billboards --usually larger, higher and more prominent--have been constructed on federal aid primary and interstate roads and that after twenty-five years, only 114,000 nonconforming signs of all sizes have actually come down.

The failure of the Highway Beautification Act to address the need for visually pleasing roads is self-evident to all who traverse our highways.[1] One need only travel I-66 between Knoxville and the entrance to the Great Smokey Mountains National Park, or see the billboards in the Intracoastal Waterway between Wilmington and Wrightsville Beach, North Carolina. Problems with visual pollution are also most evident on one of the East Coast's most well travelled interstates, I-95 between Virginia and Florida.

Two major flaws exist under the Highway Beautification Act. First, there is an exception to the ban on outdoor advertising; it allows billboards to go up into areas that are either zoned commercial or industrial or, if unzoned, used for commercial and industrial purposes. 23 U.S.C. 131(d). This exception had a

---

[1] Problems with the Highway Beautification program have been amply described in a number of documents, including the Comptroller General's Report to the Environment & Public Works Committee, U.S. Senate GAO/RCED 85-34 January 3, 1985, and regional and state studies, such as the 1984 Region IV Report on the Audit of the Highway Beautification Program, and the 1981 FHWA study of North Carolina program. Over the years, such issues as tree cutting on public rights-of-way, phony zoning, and phony designation of unzoned areas for new billboards have been reported to our organizations.

38-253 O—91——49

rationale when it was adopted by the Congress almost twenty-five years ago. Much of the country did not have zoning; yet there were many industrial and commercial areas along our highways that seemed appropriate sites for billboard advertising. In reality, the unzoned exception led to creation of a loophole whereby the most minimal business activity on a rural road qualifies an otherwise scenic area for a billboard. And in other areas, a rural and scenic location zoned for high-quality industrial and commercial development becomes subject to billboard construction under the HBA before the land is actually developed. This has occurred, for example, in Henrico County, Virginia, outside Richmond.

Second, localities are prohibited by the HBA from ridding themselves of unwanted billboards on federal aid primary and interstates, and instead must pay cash in order to remove the signs. 23 U.S.C. 131(g). Yet since 1981 there have been no funds to pay the federal share, which is seventy-five percent of the cost.

We propose is that this subcommittee consider endorsing a policy that either (1) prohibits all future construction of billboards on federal aid primary and interstate roads or (2) removes the cash compensation provision so that localities may amortize signs and phase them out as they can do with other nonconforming uses under local and state land use laws. To this end, we suggest the following areas for review:

ZONED AND UNZONED "COMMERCIAL & INDUSTRIAL" AREAS

While the federal government has spent over $200 million to remove 114,252 nonconforming billboards, over 300,000 new billboards have been constructed under the Act in either zoned or unzoned commercial and industrial areas; many of these have been constructed in rural and scenic areas.

Regarding unzoned areas, FHWA and the states are aware of many instances of sham businesses and business uses not visible from the road -- situations utilized to designate unzoned areas as commercial and industrial solely for the purposes of constructing billboards.

In terms of zoning, there are two problems. The first is phony zoning, a practice where a locality that has no zoning ordinance zones a portion of its jurisdiction--an area along a highway--solely for the purpose of constructing billboards. Numerous instances of this type of bogus zoning have been reported to us, especially in the Southeast, where there are still large areas without comprehensive zoning.

At the time the Highway Beautification Act was passed, land that was zoned usually had existing uses on it; only agricultural lands or unzoned areas remained open from development. Twenty-five years later, much of the agricultural land around towns and cities is being rezoned as commercial and industrial in anticipation of possible future growth and development.

Under the Highway Beautification Act, and FHWA regulations such zoning permits billboards to be constructed in largely rural

areas. Both the General Accounting Office and a White Paper developed for the Carter Administration's National Advisory Committee on Outdoor Advertising also noted this problem. (See Comptroller General's Report to Congress, "Obstacles to Billboard Removal," March 27, 1978, pp. ii, 27; "White Paper: Zoning" National Advisory Committee on Outdoor Advertising.) Both studies recommended requiring actual use in such zoned areas. For example, in Henrico County, outside Richmond, Virginia, agricultural areas were rezoned to industrial use in anticipation of industrial park development. The billboard companies inundated the state highway department with permit requests, which were legally permissible, because Henrico had no local ordinance to cover the situation. Henrico did then pass a comprehensive sign ordinance prohibiting future billboards. But on this interstate, the damage had been done, and state permits will grandfather those signs indefinitely under the HBA.

Congress should prohibit future construction of billboards on interstates and federal aid primary roads. If it chooses instead to permit new signs, then it should limit these to areas that are not only zoned but have actual use as commercial and industrial activities.

NONCONFORMING SIGNS

The Highway Beautification Act contemplated a phasing out of nonconforming signs through purchase by state and federal monies. 23 U.S.C. (l)(m). As is common with other nonconforming structures, the statute also anticipated that many signs would be

lost through physical deterioration by weather conditions. Although federal regulations were designed to prevent rebuilding of signs, most states have adopted formulas to restrict maintenance to a percentage of replacement cost (See 23 CFR § 750.707(a)(6)(i)). This so-called restriction actually permits signs to be constantly refurbished and, over time, totally replaced.

Congress should remove the cash compensation provision of the HBA so that localities may phase-out billboards. If it chooses to retain the cash compensation provision, Congress at a minimum should prohibit any rebuilding of existing nonconforming signs.

TREE CUTTING ON RIGHTS OF WAY AND BLOCKED OUT ZONES

Current FHWA policy permits tree cutting on public rights-of-way of federal aid primary and interstates to permit billboards to be more visible.[2] This practice is contrary to public policy, for it is a use of public property for private purposes. We need vegetative buffers along our highways for

---

[2] According to the Federal Aid Highway Program Transmittal 156 (September 26, 1975), "instances involving the destruction of trees and shrubs on the right-of-way in order to increase or enhance the visibility of an outdoor advertising sign . . . are contrary to the provisions of 23 CFR 1.23 and state laws and regulations. The state highway department should take all legal and administrative action at its disposal to abate these practices. . . ."

Unfortunately, later statements by FHWA officials have de-emphasized federal policy and have instead focused on whether or not state laws allow tree cutting. Subsequently, a number of states have permitted tree cutting on the rights-of-way at the same time that federal and state funds were used to create vegetative buffers along these highways.

appearance and safety purposes. In this time of increasing environmental awareness, we should preserve rather than destroy trees along our roadways. Congress should prohibit such practice on the public rights-of-way.

The regulation prohibiting billboards in the "blocked-out zones" near interchanges was designed to exclude excessive and distracting signs at areas where traffic is leaving or entering the highway. However, billboard companies have recognized that businesses existing close to these interchange provide a "commercial area" that allows billboards for unzoned areas. Thus they have often sought to push the limits of the regulations regarding blocked-out zones in order to erect more billboards.

REAUTHORIZATION OF THE POST-INTERSTATE SURFACE TRANSPORTATION PROGRAMS

TUESDAY, APRIL 24, 1990

HOUSE OF REPRESENTATIVES,
SUBCOMMITTEE ON SURFACE TRANSPORTATION,
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION,
Washington, DC.

The subcommittee met, pursuant to notice, at 10:09 a.m., in room 2318, Rayburn House Office Building, Hon. Norman Y. Mineta (chairman of the subcommittee) presiding.

Mr. MINETA. The subcommittee will please come to order. This hearing of the Subcommittee on Surface Transportation is a continuance of the hearings that we initiated relative to the whole issue of reauthorization of the Surface Transportation Assistance Act.

This morning we have our distinguished colleague from Iowa, Congressman David Nagle. And, David, we have your statement, so that will be made a part of the record. And if you would go ahead and proceed in your own fashion.

TESTIMONY OF HON. DAVID NAGLE, A REPRESENTATIVE IN CONGRESS FROM IOWA

Mr. NAGLE. Thank you, Mr. Chairman. Let me just take a few minutes to summarize that formal statement which I have submitted for the record. I appreciate this opportunity to appear before you today to discuss my thoughts and the need, the importance, and the urgency of a sound, aggressive National Highway Transportation policy.

When we talk about coordination and cooperation between Federal, State and local authorities to address a national need in this century, there is no greater success story than the development of the interstate highway network and the Federal highway system over the past 45 years. This Committee can be particularly proud of the central role you've played in that effort. And as we prepare to enter the 21st century, however, I believe we need a new national effort to build on that success. The reauthorization of the 1987 Surface Transportation Act is where it can and should begin. For America is at an economic crossroads; we will either invest in the future or become its victim. We'll either be prepared for new economic challenges or we'll suffer the inevitable consequences of being unprepared.

Whether America will be prepared or not in large part depends on whether we take the necessary steps today to rebuild and

strengthen our infrastructure. The growing international economy and marketplace demands that transportation no less than any other product input be of the highest quality, be the most efficient and be at the least cost. At a minimum, our national transportation highway system must include four important components.

First, our national highway transportation policy must recognize the need to continue to provide a Federal block grant to State departments of transportation for the maintenance and construction of secondary roads.

Second, the Federal Government should continue its commitment to and cooperation with States in developing their primary road systems. For example, in my own State, the entire northeast corner of Iowa has been isolated and shut off from a vibrant commerce because of an inadequate highway system. The primary systems, the major way State and local Governments are able to complement national transportation networks, but they need help to do so. I will be back on another day to make the case for improving U.S. Highway 63 north from Waterloo, Iowa to Rochester, Minnesota for precisely this reason. For now, suffice it to say that we all gain when we help States complement national transportation networks by strengthening State networks. One obviously builds upon the other.

And, third, our national highway transportation policy must recognize that Federal funding decisions and formulas must include the number of miles of roads that must be maintained as well as the normal criteria of population and traffic levels.

And, finally, our national transportation policy must recognize that the interstate highway system is a success nearing completion, we must continue the Federal commitment to develop a network of major routes which connect major metropolitan centers. To achieve that final point, I support creating a new authorization mechanism which would create a classification called Highways of National Significance. This classification would build upon the interstate system and would produce a network composed of a combination of interstate highways, primary highways and improved State highways. The Highway of National Significance Program would not only help make our transportation network more efficient and ready to meet the needs of the future, but would also provide the critical cost savings which are essential in this era of budget constraints.

A highway program which builds upon the Highways of National Significance Program can achieve nearly the same benefits as our current interstate system at nearly half the cost. There is no better example of this than a project which would pass through my State, Iowa, as it connects St. Louis, Missouri to St. Paul, Minnesota. The project is known as the Avenue of the Saints. I am here today to discuss that project with you, to recommend to seek your support for funding it. But I am here also to discuss how we should fund it. Because this project funded through a Highway of National Significance Authorization Program is a classic example of how we can meet important national transportation needs while at the same time significantly cutting the cost of doing so.

For the past three years I've worked with several colleagues in the House and Senate in the development of a four-lane highway

for St. Louis, Missouri to St. Paul, Minnesota. In 1988 my colleague from Iowa, Senator Tom Harkin, initiated a proposal to fund a study to determine the feasibility and the necessity of constructing a four-lane highway between those major metropolitan centers. Last month the committee appointed by the Federal Highway Administration submitted to the FHWA the St. Louis to St. Paul Feasibility and Necessity Study. This study looked at the feasibility of the Avenue of the Saints from five perspectives—engineering, environment, need, travel efficiency and economic development. This study found that from all of the perspectives, the development of this highway corridor is not only feasible, but would be in the national interests of the United States. This corridor which has 8.4 million people has a reasonably good east-west four-lane highway network would pour north-south arteries. The feasibility study found that the development of this missing link in the Nation's arterial system would spur economic growth within the corridor, and from the national perception improve travel efficiency to the point where the economy would be better off with the highway than without. From the local, State and national levels the development of this highway corridor is warranted.

The study also found that to take the interstate highway approach would be excessively costly. It would require the construction of a new four-lane highway at freeway standards to transverse nearly the entire route. The study determined this approach would double the cost, result in only slight increases in traffic, and given the higher costs involved, lower the cost benefit ratio to a marginal even negative levels.

By using instead the Highway of National Significance approach—that is, a mix of existing interstate highways, upgrading existing two-lane highways to four-lane roads at expressway standards—we can achieve the desired result at half the cost, in less time with less impact on surrounding lands, and with highly favorable returns to the taxpayer.

In the case of the Avenue of the Saints, $1.30 return for every Federal $1.00 expended under a Highway of National Significance Program compared to just $.81 return for every Federal $1.00 expended under an interstate highway program approach.

I am well aware of and sensitive to the many competing demands this Committee will receive for projects from many of the different regions of the country. Most are urgently needed and most would represent a wise investment of public funds. Unfortunately, limited resources dictate that only a few will win funding. I understand the hard choices you're called upon to make and, frankly, I don't envy you. I think there are several reasons to support this specific project which go well beyond the compelling arguments identified by the Feasibility Study Committee.

Generally your Federal dollar goes further in rural areas because many costs of construction, primary rights-of-way costs are much lower than they are in urban areas. Strengthening and improving America's rural transportation network also has an important effect which benefits in urban America as well. One way to ease the chronic problems of urban America, many of which can be traced back in one form or another of overcrowding, is to make rural America a more viable option as an alternative place to live.

A modern, comprehensive and efficient transportation network is a key element in that equation.

Thank you, Mr. Chairman, for the opportunity to appear in front of you this morning.

Mr. MINETA. Thank you very much, Congressman Nagle, on your complete and full statement with regard to this Avenue of Saints. This subcommittee is very well aware of your efforts as well as the efforts of my former colleague and classmate, now U.S. Senator, Tom Harkin, in terms of advancing the construction of this Avenue of the Saints Highway Project. I'd like to ask, since you've mentioned in your statement, the proposal for the development of a category of Highways of National Significance that this would be the basis for construction of the Avenue of the Saints.

Is it your understanding that if the Congress were to establish this category of Highways of National Significance, that the States within the corridor between St. Paul, Minnesota and St. Louis, Missouri would then work cooperatively and allocate the necessary resources in order to make sure that this vitally important project is completed?

Mr. NAGLE. That is correct, Mr. Chairman. I think that the seed for that was, frankly, planted when the feasibility study required all three State transportation departments of the three States to work together in terms of coming up with a specific route recommendation. The degree of cooperation that was achieved between the three States in selecting a route under very competing demands from different communities and the fact that they picked the least cost route and one of the most efficient routes in terms of travel time is indicative that they'd have that capacity to cooperate were this project authorized under the Highways of National Significance Section of the new Surface Transportation bill.

Mr. MINETA. Very well. Mr. Shuster.

Mr. SHUSTER. No questions, thank you.

Mr. MINETA. Mr. Duncan.

Mr. DUNCAN. Mr. Nagle, how far is that Avenue of the Saints; how many miles is it from St. Paul to St. Louis? Do you know?

Mr. NAGLE. I do, and I can't think of it. Thank you for asking me.

Mr. DUNCAN. I'm sorry.

Mr. NAGLE. I would say this, however, that most of the route from St. Louis to the Minnesota-Iowa border is already four lanes, and there is a chunk of about 100 miles in Iowa between there and the mid-southern point of Iowa that is not. And then a four-lane interstate system exists all the way north to Waterloo in the northern section. And then there's about an 18 to 30 mile gap between Waterloo and Mason City that would tie it right into Interstate 35. So we're not talking about a lot of building here really. But we are talking about—by putting those little chunks in in Southern Iowa and mid-Iowa, you've got a major northwest passageway developed for—I think the estimate on the cost is $410 million over a six-year period.

Mr. DUNCAN. $410 million for what part of it?

Mr. NAGLE. That would complete the route.

Mr. DUNCAN. That would do the whole distance?

Mr. NAGLE. Yes. And I think that's the significance, as you're aware, when you start talking about Highways of National Significance is not to go out and try to build a whole new interstate every place in the country, but to try to build on what we already have.

Mr. DUNCAN. I think that's a good approach to do it this way. My mother's from Iowa City.

Mr. NAGLE. Well, I can tell you, sir, that everyone in Iowa City including your mother is strongly in favor of this project.

Mr. DUNCAN. Well, she doesn't live there now.

Mr. NAGLE. Well, if she did live there, sir, she'd be strongly in favor of this project. She may want to go back and visit, and I'd hate to see her try to drive from St. Louis to Iowa City. But if you build a new road for her, she probably could.

Mr. DUNCAN. I think you're right; I think that one of the keys to redeveloping rural America might be to improve the transportation facilities. Also, I'd like to see—it doesn't have anything to do with this Committee, but I'd like to see some of these Federal departments and agencies move to places like Tennessee and Iowa instead of putting them all here in Washington. I think that would help some of our smaller cities and towns, too.

Mr. NAGLE. The point you make, though, is—and I don't know the situation in Tennessee and Kentucky, but we've suffered a tremendous outward migration of population. In one brief six-year period between 1980 and 1986 we lost about 84,000 people between the ages of 18 and 24. And the Midwest, particularly the rural America is becoming one of the oldest populations. And if we don't give those people a transportation system both to relieve the pressure on urban America but also to afford us the opportunity of transporting goods and services, then that outward migration may very well continue.

Mr. DUNCAN. Thank you very much.

Mr. NAGLE. Thank you.

Mr. MINETA. Mr. Nagle, thank you very much for your presence here and testimony with regard to the Avenue of the Saints.

Mr. NAGLE. Thank you, Mr. Chairman.

[Mr. Nagle's prepared statement follows:]

STATEMENT BY

U.S. REP. DAVE NAGLE (D-3RD IA)

SUBCOMMITTEE ON SURFACE TRANSPORTATION
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
U.S. HOUSE OF REPRESENTATIVES

APRIL 24, 1990

MR. CHAIRMAN, AND MEMBERS OF THIS SUBCOMMITTEE:

I appreciate this opportunity to appear before you today to discuss my thoughts on the need, the importance, and the urgency of a sound, aggressive national highway transportation policy.

When we talk about coordination and cooperation between federal, state and local authorities to address a national need in this century, there is no greater success story than the development of the interstate highway network and the federal highway system over the past 45 years. This committee can be particularly proud of the central role you have played in that effort.

As we prepare to enter the 21st century, however, I believe we need a new national effort to build on that success. The re-authorization of the 1987 Surface Transportation Act is where it can and should begin.

In their "Statement of National Transportation Policy," President Bush and Secretary of Transportation Samuel Skinner rightfully recognized that "the United States must renew its commitment to maintaining our transportation system as the finest in the world". I commend them for that observation.

Unfortunately, in the same document, they went on to abdicate most of the federal government's responsibility in that effort. They would shift much of the federal government's responsibility for strengthening and improving our national transportation network -- work critical to America's ability to compete in the 21st century -- to state and local governments.

I believe such a change would not only be poor national policy, but would also needlessly rip apart the federal, state and local government partnership which has served us so well for so many years in this area.

That partnership should be maintained and strengthened. And as we move toward the new century, the federal government should continue to be the critical link in the nation's transportation network. I urge this subcommittee to reject any efforts to weaken that commitment.

The need to strengthen -- not weaken -- that partnership becomes especially clear when one considers the magnitude of the work which lies before us. The American Association of State Highway Traffic Organizations (AASHTO) estimates that over the next thirty years, we need to increase infrastructure spending by 20 percent just to maintain what we have. To meet increased demands, they say infrastructure spending will have to increase by 50 percent.

I am especially pleased to note that the House Budget Committee and the House Democratic Leadership recognize the important responsibility the federal government has in meeting this important national need. The Budget Committee has presented, and the Democratic Leadership has endorsed, a budget which responsibly addresses infrastructure maintenance and construction needs. While it's still early in the budget process, and the actual numbers will undoubtedly change as that process continues, it is clear their general approach is the right one.

For America is at an economic crossroads. We will either invest in the future or become its victim. We will either be prepared to meet new economic challenges, or we will suffer the inevitable consequences of being unprepared.

Whether America will be prepared or not, in large part, depends on whether we take the necessary steps today to rebuild and strengthen our infrastructure. For one of most important components of America's economic strength and ability to compete is how well our manufacturers, farmers and small businesses are able to get their goods to the market. That is where the federal role in national transportation policy is critical.

The growing international economy and marketplace demands that transportation -- no less than any other product input -- be of the highest quality, be the most efficient, and be at least cost. Through a well-planned and equally well-maintained transportation network of highways, railroads and airways, America can ensure that our dispersed economy will be able to move the goods and services necessary to drive our economic growth....and that no region of the country is left out of that growth.

At a minimum, our national highway transportation system must include four important components.

First, our national highway transportation policy must recognize the need to continue to provide a federal block grant to state Departments of Transportation for the maintenance and construction of secondary roads that feed into the primary highway system. In my state, well maintained secondary roads are a critical component in the ability of farmers to move their goods to the market. Very simply, poor roads lead to higher production costs which cost us all in the long run, either through higher prices at our local grocery store; or higher federal farm program costs when the safety net is forced to stretch even further to bridge a widening gap between production costs and market return.

Second, the federal government should continue its commitment to, and cooperation with, states in developing their primary roads systems, to help meet important state and local transportation and local needs. For example, in my own state, the entire northeast quadrant of Iowa has been isolated and shut off from a vibrant commerce because of an inadequate highway system. The primary highway system is the major way state and local governments are able to compliment national transportation networks, but they need help to do so.

I will be back another day, to make the case for improving U.S. Highway 63 north from Waterloo, Iowa, to Rochester, Minnesota, for precisely this reason. For now, suffice it to say that we all gain when we help states compliment national transportation networks, by strengthening state networks. One, obviously, builds upon the other.

Third, our national highway transportation policy must recognize that Federal funding decisions and formulas must include the number of miles of roads that must be maintained, as well as the normal criteria of population and traffic levels. As you address the federal highway formula, I ask you to keep in mind that a mile of roadway in urban America requires the same amount of asphalt as a mile of roadway in rural America. Population density and usage are important criteria in the distribution of highway funds, but so is the mileage of roads to be maintained.

And finally, our national transportation policy must recognize that while the interstate highway system is a success nearing completion, we must continue the federal commitment to develop a network of major routes which connect major metropolitan centers. Improved efficiencies can be achieved by continuing development of major highways between metropolitan areas, where appropriate criteria has been set, and most importantly, where the feasibility of such a highway is shown.

To achieve that final point, I support creating a new authorizing mechanism which would create a classification called "highways of national significance".

This classification would build upon the interstate system, and would produce a network composed of a combination of interstate highways, primary highways and improved state highways.

A "highways of national significance" program would not only help make our transportation network more efficient and ready to meet the needs of the future, but would also provide critical cost savings, which are essential in this era of budget constraint.

Let me be quite specific. A highway program which builds on the "highways of national significance" program can achieve nearly the same benefits as our current interstate system at nearly half the cost.

There is no better example of this than a project which would pass through my state, Iowa, as it connects St. Louis Missouri and St. Paul, Minnesota. The project is known as the "Avenue of the Saints." A regional transportation commission recently recommended to the Federal Highway Administration that it be built.

I am here today to discuss that project with you; to recommend and to seek your support for funding it. But I am also here to discuss how we should fund it; because this project, funded through a "highways of national significance" authorization program is a classic example of how we can meet important national transportation needs while at the same time, significantly cutting the cost of doing so.

For the past three years, I have worked with several colleagues in the House and Senate on the development of a four-lane highway from St. Louis, Missouri to St. Paul, Minnesota. In 1988, my colleague from Iowa, Senator Tom Harkin, initiated a proposal to fund a study to determine the feasibility and necessity of constructing a four-lane highway between those major metropolitan centers.

Last month, a committee appointed by the Federal Highway Administration submitted to the FHWA the "St. Louis to St. Paul Feasibility and Necessity Study." This study looked at the feasibility of the Avenue of the Saints from five perspectives: engineering, environmental, need, travel efficiency and economic development.

This study found that from all perspectives the development of this highway corridor is not only feasible, but would be in the national interest of the United States.

The feasibility study did not recommend a new interstate highway between the two metropolitan areas. It recommended a route which is a balanced mix of existing interstates and four-lane highways, with construction to widen current two-lane highways to four-lane highways at expressway standards.

This corridor, which has 8.4 million people, has a reasonably good east-west, four-lane, highway network, but poor north-south arteries. The feasibility study found that the development of this missing link in the nation's arterial system would spur economic growth within the corridor, and from the national perspective, improve travel efficiencies to the point where the economy would be better off with the highway than without. From the local, state and national levels, the development of this highway corridor is warranted.

It would be extremely difficult, if not impossible, for the states to achieve this on their own, without federal assistance. Nor should they be expected to do so without federal assistance. The study determined, after all, that the "Avenue of the Saints" would provide important national economic benefits.

The study also found that to take the interstate highway approach would be excessively costly. It would require the construction of a new four-lane highway at "freeway" standards to traverse nearly the entire route. The study determined this approach would double the costs, result in only slight increases in traffic, and -- given the higher costs involved -- lower the cost/benefit ratio to marginal, even negative levels.

By using, instead, the "highways of national significance" approach -- that is, a mix of existing interstate highways, and upgrading existing two lane highways to four lane at "expressway" standards -- we can achieve the desired result at half the cost; in less time; with less impact on surrounding lands; and with highly favorable return to the taxpayer: in the case of the Avenue of the Saints, $1.30 returned for every federal dollar expended under a "highways of national significance" program, compared to just 81 cents returned for every federal dollar expended under an "interstate highway" program approach.

We live in a difficult era.

On one hand, we face enormous economic challenges as we stand on the brink of the 21st century. On the other hand, we face the hard reality of constricted budgetary ability and competing budgetary priorities.

The answer is not to stop investing in the future. Such investment is critical. The answer is to invest federal resources <u>most</u> wisely, and that will often require some new thinking.

Congress must make the necessary investments in our future. It must also make certain those funds are not wasted. Bad legislation and programs which needlessly waste these scarce federal resources, need to be questioned.

And while traditional funding mechanisms and programs have worked magnificently in the past, we must constantly be aware that circumstances and the times are always changing. We need a transportation program and a funding mechanism which recognizes the new realities.

Creating a specific authorization program for funding "highways of national significance", for projects like the "Avenue of the Saints", would be a wise investment of federal resources. It would meet pressing national, state, and local economic needs. It would do so at about half the cost of the traditional interstate highway funding approach. And it builds on the the magnificent success of the nation's interstate highway program now nearing completion.

Most of my remarks here today have focused on the new funding mechanism I support for the "Avenue of the Saints" and for projects like it throughout the country. Allow me a moment to talk about the Avenue of the Saints project specifically.

There are many compelling reasons to fund construction of the "Avenue of the Saints", most of which are contained in the findings of the feasibility study committee. Since I know you are already familiar with those findings or soon will become so as your deliberations continue, I will not repeat them here, except to reiterate the most important one of all: the "Avenue of the Saints" does far more than meet critical state and local economic needs. The feasibility study concluded it also meets important national economic needs, as well.

I am well aware of and sensitive to the many competing demands this committee will receive for projects from the many different regions of the country. Most are urgently needed and most would represent a wise investment of public funds. Unfortunately, limited resources, dictate that only a few will win funding. I understand the hard choices you are called upon to make and, frankly, I don't envy you.

I think there are several reasons to support this specific project which go well beyond the compelling arguments identified by the feasibility study committee. As you deliberate, I would ask you to consider and keep in mind the following:

Generally, your federal dollar goes further in rural areas, because many costs of construction -- primarily right of way costs -- are much lower than they are in urban areas.

Strengthening and improving rural America's transportation network also has an important effect which resonates in urban America as well. One way to ease the chronic problems of urban America -- most of which can be traced back to one form or another of overcrowding -- is to make rural America a more viable option as an alternative place to live. A modern, comprehensive and efficient transportation network is a key element of that equation.

Mr. Chairman, I know that over the course of your subcommittee's extensive hearings on the future of U.S. highway transportation policy, your committee will be bombarded with conflicting thoughts and proposals. One of those, will undoubtedly be the Administration's proposal to, in effect, impose upon the states and localities almost total responsibility for meeting the national goal of a world-class transportation network.

I disagree. Retreat, retrenchment, and abdication of federal responsibility are no way for a great nation to prepare to meet the 21st Century.

We can have a national transportation policy in which the federal government is a full partner. We can have a national transportation policy in which the federal government shoulders its fair share and its full responsibility. And we can, at the same time, have a national transportation policy which recognizes fiscal reality, by acknowledging that as times change, so must our programs and policies.

In short, Mr. Chairman, we can meet the 21st century on our own terms, and fully prepared for the economic challenges it presents, if we have the will, the foresight, the creativity and the imagination to respond to new times with new ideas. Moving beyond the interstate highway system program to a program which builds "highways of national significance" is but one of those ideas and I hope you will give it your full consideration.

I thank you for this opportunity to share my views.

Mr. MINETA. At this time I'd like to call John W. Hill, Jr., Associate Director of Transportation Issues, U.S. General Accounting Office to come before us. Mr. Hill, your statement will be entered as part of the record. So, if you would go ahead and proceed in your own fashion, sir, and introduce your colleagues.

TESTIMONY OF JOHN W. HILL, JR., ASSOCIATE DIRECTOR, TRANSPORTATION ISSUES, RESOURCES, COMMUNITY AND ECONOMIC DEVELOPMENT DIVISION, U.S. GENERAL ACCOUNTING OFFICE, ACCOMPANIED BY JACQUELYN L. WILLIAMS-BRIDGERS, ASSISTANT DIRECTOR, TRANSPORTATION ISSUES, AND ROBERT D. TRACY, DETROIT REGIONAL OFFICE, GENERAL ACCOUNTING OFFICE

Mr. HILL. Thank you, Mr. Chairman and members of the Subcommittee. On my right we have Jacquie Williams-Bridgers. Jacquie Williams-Bridgers is my Assistant Director in charge of infrastructure issues. And on my left is Bob Tracy, our evaluator in charge of our audit effort.

Thank you for this opportunity to testify on our continuing work for the Full Committee on efforts to preserve the interstate system. Although the interstate system represents only one percent of all roads, interstate routes carry 21 percent of the Nation's vehicle traffic. Because the system has assumed a dominant and vital role in the Nation's transportation network, preservation of the over $100 billion Federal investment in interstate construction must be assured.

In 1988 the Department of Transportation classified 43 percent of the Nation's interstate pavement as having a ride that may be barely tolerable or worse. Progress in adequately maintaining the interstate system, a state financed responsibility, has been mixed in part because some States have not adequately funded interstate maintenance. In two of the three States we visited, needed maintenance was not performed due to insufficient resources. DOT estimates a total of $4.7 to $6.1 billion will be needed annually in federal and State funds to meet interstate preservation needs.

DOT estimates that about half of these funds will be used for major interstate widening and reconstruction activity. The other half would go primarily to preserve existing interstate pavement. If, as projected by DOT, the states were to spend about 50 percent of the 4-R funds for pavement widening activities, the scope of the interstate 4-R Program would change from primarily a pavement preservation program to a program with a large expansion element. Given the overall condition of the interstate, increased funding needs and the limited resources at both the State and Federal level, we are presenting some options that the Congress may wish to consider for realigning Federal responsibilities and program funding to help protect the Nation's investment in the interstate system.

FHWA classifies pavement into three broad categories: good, fair and poor according to roughness.

Our first photo shows an example of what FHWA would consider to be good pavement. This pavement provides a smooth ride with little or no signs of deterioration.

[Showing pictures of pavement on easel.]

Our second photo is an example of fair pavement which provides a barely tolerable ride at high speeds and has a number of surface defects. Poor pavement produces an uncomfortable ride requiring reduced driving speeds. It also has excessive bumps, depressions, holes and needs resurfacing or reconstruction.

As shown in the next chart, the amount of good pavement has decreased from 62 percent in 1981 to 57 percent in 1988, while the amount of fair pavement has increased from 25 percent to 31 percent. Poor pavement has remained at about 12 percent between 1981 and 1988. The bottom line is that 43 percent of the Nation's premier highway system may produce a ride that is barely tolerable or worse. Moreover, the outlook for improvement beyond this point is not encouraging since DOT estimates of future needs are based on existing pavement conditions.

For example, the Department's estimate of future 4R needs through the year 2005 is based on maintaining the 1985 conditions. In 1985 about 41 percent of pavement was rated in fair or in poor condition. DOT has not established goals to improve conditions beyond the 1985 level.

Routine maintenance can include many different activities, such as repairing cracks, barriers, fixing potholes, resealing pavement cracks, removing snow and ice, and painting bridges. Maintenance activities that preserve pavement life such as resealing joints are cost effective. However, these types of maintenance activities are not eligible for 4R funds, yet, if applied in a timely manner, these maintenance activities could reduce or postpone the need for 4R funds.

A DOT-OIG report stated that had routine maintenance been performed when needed, planned 4R projects in three States costing over $88 million may have been deferred or been less costly. In our review we judgmentally selected three States—California, Louisiana and Michigan—to review the adequacy of State maintenance efforts. We found both Louisiana and Michigan did not perform needed maintenance work and thereby affected the structural integrity of the roadway. For example, in Louisiana, FHWA inspection showed that 39 different types of maintenance deficiencies including pavement blowouts, unsealed joints, ruts and damaged guard rails. In addition, FHWA analysis showed that State funding for maintenance supplies had declined by 34 percent over a three-year period and the number of maintenance employees had been reduced by 23 percent in the past 18 months.

In Michigan the State did not perform all needed routine maintenance in the following areas: sealing pavement cracks and joints, painting bridges and replacing or repairing damaged guard rails and right-of-way fences. A Michigan transportation official told us that much of the needed maintenance work was related to the structural integrity of the roadway. Furthermore, maintenance funding is not expected to be sufficient to eliminate the maintenance backlog that currently exists.

Deferral of needed maintenance work was not evident in California. California State Transportation officials said that they were able to keep up with maintenance needs, and FHWA concurred with this statement. However, State officials cautioned that be-

cause of rising maintenance costs, the State may be hard pressed to meet future maintenance needs.

In addition, the Department of Transportation estimates the 4R Program will need Federal and State funds totalling $4.7 billion to $6.1 billion annually through the year 2005. If the Federal cost share remains at 90 percent, the required Federal investment will be between $4.2 and $5.5 billion annually.

As previously mentioned, if about 50 percent of 4R funds are spent on major interstate widening, this spending level would represent a significant departure from historical spending trends. In 1981 less than one percent of 4R funds was spent on major widening. In Fiscal Year 1989 13 percent was spent on this activity.

The Department's estimate of annual funding needs far outstrips the current 4R level of $2.8 billion per year. Furthermore, the Department estimates that lane widening of 11,000–15,000 additional interstate miles is needed. But the cost of these additional miles is not reflected in future needs estimates because of right-of-way constraints.

Mr. Chairman, almost half of the Nation's premier highway system may be in barely tolerable or worse condition. Furthermore, due to funding difficulties, some States have not performed needed maintenance to slow pavement deterioration and reduce 4R costs. In light of the Department's estimate of the need for significant increases over current 4R funding levels which will only hold the line at 1985 pavement conditions, program modifications need to be considered to more effectively use the 4R dollar.

As your Subcommittee deliberates the reauthorization of highway programs, we suggest you consider establishing a national pavement condition goal that would set the minimum acceptable percentage of good pavement; redefining the range of activities eligible for 4R funding to encourage States to address maintenance activities directed at preserving the interstate pavement or resolving safety-related deficiencies; emphasizing interstate priorities through maintaining the 90 percent Federal cost share on those projects that have numerous beneficiaries and decreasing the cost share on those projects that have a limited number of beneficiaries; and requiring an assessment of the extent alternative transportation strategies are expected to alleviate the expected shortfall of interstate lane widening and associated costs.

Mr. Chairman, this concludes my testimony. My colleagues and I will be happy to answer any questions.

Mr. MINETA. Well, thank you very much for that not so happy picture about the state of our roads, but without a doubt a realistic one. One of the things that I've been thinking about is this whole issue of requiring or mandating some kind of a maintenance program, pavement maintenance program; and that's one of the things that you're alluding to here or specifically recommending in terms of some program to require the states to emphasize this maintenance program.

Also, in two of the three States you visited maintenance was not performed due to insufficient resources being devoted to maintenance. In your view, would providing Federal funds to the States to carry out preventive maintenance activities result in a cost-effective use of Federal funds?

Mr. HILL. Yes, Mr. Chairman; some studies have shown and we've looked at other studies that report certain maintenance activities can be cost effective in reducing the need for 4R funding. We would, however, stress that we're not saying that the Federal Government should accept the total responsibility for carrying out the cost of maintenance. We are saying, though, that certain activities if performed in a timely manner, could either forestall or lessen the amount of cost that the 4R program would have to bear.

Those types of activities would extend the life of the roadway but less than the general required 4R limit of eight years currently.

Mr. MINETA. Now in the Federal Aid Highway Act of 1981 the Interstate Construction Program was redefined to reduce the overall cost to complete the system. Many of the previously eligible projects under the Interstate Construction Program were made eligible under the Interstate 4R Program. Based on your review of the States' funding of interstate 4R projects, is there a need to redefine the Interstate 4R Program to limit its use to preservation of interstate systems?

Mr. HILL. We have not said that there's a need to redefine the Interstate Program to limit its use; we do feel, however, that there are certain options that the Committee can consider. One would be to change the cost share on some of the projects that may not help with preservation of the interstate. And in doing so, you would certainly provide less incentive for the State to fund those projects. For other projects which would extend the life of the pavement and have a higher cost share for the Federal Government, it would certainly encourage states to perform those activities.

Mr. MINETA. The Federal Highway Administration uses the Pavement Serviceability Rating—PSR—to assess the condition of the Nation's highway system. Does the Pavement Serviceability Rating system provide reliable data for assessing the condition of the Nation's highway system?

Mr. HILL. The pavement serviceability rating really just looks at the surface of the pavement and any noticeable cracks. I think if Nick Greifer could put up one of the pictures and we could show you again. The one here on poor condition and the previous one on fair condition.

[Showing pictures of pavement on easel.]

Highway inspectors would look at the surface of the road and also test the rideability of the surface of the road. There could be other conditions in the road that would not show up based on this measure. Some of those conditions might be deterioration in the underlying material which is not shown yet in surface cracks. There could be other conditions in the road that have not shown up yet in rideability. So that if anything, we would say that this would probably understate the amount of poor pavement and the amount of fair pavement which exists in the system.

Mr. MINETA. I guess I'm too far away. What I'm seeing on the right-hand side is a shoulder, is it not?

Mr. HILL. That's right.

Mr. MINETA. You're not pointing to the shoulder; what is it about the pavement condition there that says that this is one that's in fair condition rather than in——

Mr. HILL. Okay. Nick, if you would point out the cracks on this one.

Mr. MINETA. Oh, okay. I see. All right. And those are not at the expansion joints?

Mr. HILL. No, they're not.

Mr. MINETA. Let me ask, Mr. Hill, about what's the definition of maintenance? Between, I guess—what's basic maintenance? What's preventive maintenance? Or is there a difference? Are there different grades of maintenance that we're talking about?

Mr. HILL. Well, the 4R Program would actually pay for any work that extends the life of interstate pavement over an eight-year period. As far as actual examples of maintenance activities, perhaps one of my colleagues could give you some detailed examples of that.

Ms. BRIDGERS. Mr. Chairman, there is a broad range of over 100 various activities that can be defined as a maintenance activity. States are responsible for most of the routine maintenance activities, including everything from mowing the grass off the shoulders of the road to resealing cracks in the pavement. Some of the preventive maintenance activities that we suggest might be included in the 4R Program that would extend the life of the pavement would include resealing the pavement, and sealing the more serious cracks and joints in the roadway that cause damage to the structural integrity of the road system.

Mr. MINETA. Are we doing enough in research and development for new products in terms of just maintenance, or do we leave that to the private sector and companies to come up with new products? Or is Federal Highway Administration doing much in terms of research or TRV or Carnegie-Mellon Institute or anybody else?

Ms. BRIDGERS. There is a Federal presence in research. The Long-Term Pavement Performance Program is one such research project that is looking at methods and new technologies that are available to extend the life of the pavements. Whether or not the Federal Government is doing enough in that area, I would suggest that there always could be more done to commit Federal funds to researching life extension for pavements.

Mr. HILL. Certainly one of the problems which some states have experienced was that the roads, due to weather conditions, did not last as long as they had been expected to last. So, consequently, research into problems that had occurred in those roads under certain weather conditions would be helpful in determining how the roads can be reconstructured in the future.

Mr. MINETA. When you were looking at this, did you sort of measure the state of the road against the design life of that road or highway as to whether or not these roads were getting torn up before they really should have?

Ms. BRIDGERS. Mr. Chairman, we did not independently assess the conditions of the road systems. We relied totally on FHWA estimates of road condition. However, we looked at States' maintenance practices, methods that they used to maintain and to preserve the roads systems and compared states' use of their maintenance funds, to their use of 4R funds.

Mr. MINETA. Were we able to assess—let's say, up through 1970—let's say if we used nine inches of pavement versus since

then; maybe going to 15 inches of pavement and how that's affected durability or maintenance program?

Mr. HILL. No, we did not get into that detail.

Mr. MINETA. Thank you. Mr. Packard?

Mr. PACKARD. Thank you, Mr. Chairman. Mr. Hill, of the three States you visited, Louisiana and Michigan showed a poor maintenance record as I understand your testimony. Do they have a different maintenance schedule, different maintenance program than California? Why do you feel that California has shown a different record?

Mr. TRACY. Basically we found that the prime difference was the lack of funding of maintenance-type activities. In California they were able to—assess their needs on a two-year basis. During that time period they had sufficient funds to meet their needs. In Louisiana they also identified their needs, but they did not have sufficient funds to meet the needs, and the same thing for Michigan. Basically, it was one of inadequate maintenance.

Mr. PACKARD. So there's no major difference, special program that they're doing in California that could be a prototype for other places other than just increased funding?

Mr. HILL. Well, there are a lot of other factors that account for differences in road condition, other than just the maintenance activities that are performed. The States that we've selected were chosen because they were in different regions of the country and the road conditions would be subjected to different types of weather. It's really hard to compare one State to the next. Even if California or if Louisiana had performed the same maintenance as Michigan, they still may have resulted in different conditions in the road because of the weather. Also, the traffic is a factor.

Mr. PACKARD. The proposal is that where those States do not have an adequate maintenance record that their funds be withheld. If funds are the primary difference or one of the major differences between the records from one State to another, the withholding of funds could further exacerbate the problem, and I'm wondering if there's been any thought as to how that, how we can reconcile that hammer act or clause in existence.

Mr. HILL. Certainly withholding funds could have an impact on the State's ability to perform some of the maintenance activities. However, the Federal Government, through the 4R program, is really not funding the maintenance activities that States are financially responsible for withholding federal funds would certainly have an impact on resurfacing which might be called for as a result of the pavement having become in poor condition because of the lack of maintenance. We propose that the Federal Government try to create incentives for States to spend the State and Federal dollars in those areas that would forestall the need to spend additional Federal dollars later down the road. So it's an attempt to direct the funds, certainly not trying to necessarily cut off the funds.

Mr. PACKARD. Thank you very much.

Mr. MINETA. Mr. Skaggs.

Mr. SKAGGS. Thank you, Mr. Chairman. Mr. Hill, I'm sorry I wasn't here when you began your testimony, and you may have covered this, but in case you haven't, I recall from my days as a

State legislator hearing from our highway people in Colorado very compelling testimony about sort of like flossing your teeth—if you'll do the good work on preventive maintenance, it saves you dentures down the road a ways. And perhaps if you could recount; I just need to have my mind refreshed—some of the longer term cost benefit aspects of carrying out the suggestions you're making.

Mr. HILL. Certainly sealing pavement cracks as we saw on some of the examples up here would forestall the need to resurface that road because when water is allowed to get into the road and then you ride over that, it weakens the pavement and it can cause the cracks to widen and the surface to deteriorate even further. Also, just maintenance activities such as cleaning out gutters certainly could take water away from the roadway and consequently not allow it to sit on the surface and eat into the pavement eventually and then cause the cracks again. The same is true with corrosion on bridges. Simply painting the bridges can help to extend the life of those bridges beyond what it would have been if it's allowed to corrode from the exposure of water.

Mr. SKAGGS. Do I understand you correctly that we now really don't have anything built into the Federal law that provides a clear incentive to the States to do the sorts of things that avoid a hit on the Federal commitment on this in the long haul?

Mr. HILL. Right now it appears that on those types of activities that would extend the life of the pavement for shorter than eight years, there's basically a hammer that if we find in those States that they're not performing the needed maintenance activities, then there can be drastic action taken to withhold other funds. But currently the incentives are really not there for them to provide the maintenance from the Federal level.

Mr. SKAGGS. So it's a stick but not a carrot?

Mr. HILL. It's a stick but not a carrot at this point.

Mr. SKAGGS. I'm also intrigued with one of your recommendations where you say we should be looking at emphasizing projects with numerous beneficiaries versus few. That's at a fairly high level of abstraction. Could you give me some examples of the sorts of things that you have in mind there and perhaps some suggestions on how we might provide statutory formulation for such a concept?

Mr. HILL. Let me try to bring that out of the clouds a little bit then. One of the activities that we certainly had in mind was providing additional ramps in certain communities which would allow access to the interstate and allow the development of the community. This may or may not be an activity that we'd want to fund at 90 percent because it has certainly a limited benefit to those people just in that particular area. Also, there were a few other examples—Jackie.

Mr. TRACY. Well, as the Chairman mentioned before, there were a lot of projects in 1981 that were part of the construction of the initial interstate that have now become eligible for 4R funding. Among them were sound barriers, jogging trails, equestrian trails and landscape projects for the interstate—things of this nature. For these types of projects we thought a lower cost share might be appropriate.

Mr. SKAGGS. Thank you, Mr. Chairman.

Mr. MINETA. Mr. Duncan.

Mr. DUNCAN. No questions, Mr. Chairman.

Mr. MINETA. Mr. Cox.

Mr. COX. Just briefly. It's been my privilege to talk to some people who are developing new kinds of pavement. There are a lot of people doing incipient R&D across America on this subject. What's your estimation of the Federal role, what should be the Federal role under 4R or otherwise in developing new kinds of surface for roads?

Mr. HILL. Well, we certainly think that the Federal Government should be involved in encouraging that type of research. As a matter of fact, that type of research certainly would forestall the need for the Federal Government to invest additional funds in 4R resurfacing at a point down the road. Certainly there should be a cost-benefit analysis done to actually look at the potential cost savings when developing these different types of pavement versus the need for accelerated resurfacing at a later point in time. But clearly the Federal Government has a role in that.

Mr. COX. Are you satisfied with the current level of attention that's been paid by the Federal Government to surface materials development?

Mr. HILL. We have not looked specifically at all of the things that the Federal Government is doing in that area. I guess you can always say that the Federal Government could do more, but we have not done a cost-benefit analysis.

Mr. COX. But it's that analysis that's, of course, necessary because the real question is whether we ought to put our resources there or somewhere else. One of the developments that I've been made aware of, something called Duraphalt which is allegedly going to last under heavier stress and strain much longer than current surfacing, particularly asphalt. I know that the people who are trying to produce Duraphalt are having trouble getting their point across here in Washington, and I don't know if that's due to lack of funds or some other reason. But I want to be sure that as we take seriously the problem of maintenance, that we avail ourselves of all opportunities to use better materials so that the roads we build and resurface last that much longer.

Mr. HILL. We would agree with that. The answer to the highway problem certainly is not just building new roads or resurfacing them or even widening them as an answer to congestion. I think the Federal Government should be looking at all options that may produce some promising cost benefit results in the future.

Mr. COX. One last question. Are you familiar with the potential reprogramming authority that will be given to EPA to divert monies away from highway construction and maintenance towards pollution control in the Clean Air Act?

Mr. HILL. I am not specifically familiar with that.

Mr. COX. If you were, I would ask you whether or not you think that our maintenance program is in any way going to be compromised by such a discretionary authority. Since you haven't yet become familiar with it, I'd just direct your attention to it and perhaps GAO might have some views on that in the future. Thank you.

Mr. MINETA. Mr. Bosco.

Mr. BOSCO. I have no questions.

Mr. MINETA. Well, thank you very much then—I'm sorry. Congressman Hammerschmidt, our very fine ranking Republican on the Full Committee on Public Works and Transportation. I apologize.

Mr. HAMMERSCHMIDT. Thank you, Mr. Chairman, I have no questions.

Mr. MINETA. Well, Mr. Hill, Ms. Bridgers, and Mr. Tracy, thank you very much for your very fine report, and I know that we will be using it for the basis of formulating some, I guess, I should use the word mandated. But some kind of maintenance program to make sure that we don't lose our investment that we've made in the interstate system. So thank you very, very much.

Mr. HILL. And we thank you for the opportunity to testify.

[Mr. Hill's prepared statement appears on page 1791.]

Mr. MINETA. As our next witness, we are pleased to have Governor Wallace Wilkinson from the great State of Kentucky who is the Vice Chair for the National Governors Association of their Committee on Transportation, Commerce and Communications. Governor Wilkinson, it's good to see you again. Your full statement on behalf of the National Governors Association will be made a part of the record. So if you would go ahead and proceed in your own fashion, sir.

TESTIMONY OF HON. WALLACE WILKINSON, GOVERNOR, COMMONWEALTH OF KENTUCKY, AND VICE CHAIRMAN, COMMITTEE ON TRANSPORTATION, COMMERCE AND COMMUNICATION, NATIONAL GOVERNORS' ASSOCIATION, ACCOMPANIED BY CHARILYN W. COWAN, DIRECTOR, CAPITAL RESOURCES GROUP, NATIONAL GOVERNORS' ASSOCIATION

Governor WILKINSON. Thank you, Mr. Chairman. I appreciate that. Good morning. To the members of the Committee I want to say that on behalf of the National Governors' Association and Chairman Orr, who unfortunately could not be here, and as I've said earlier this morning, I'll try to be a brief but effective substitute for her this morning.

I appreciate the invitation to come before you today to discuss the Governors' concerns about reauthorization of surface transportation programs.

We are all aware of the challenges confronting the Nation's surface transportation system—deteriorating bridges, congested metropolitan areas, inefficient connections, regions without access to a high quality system of surface transportation. The situation in my view has never been so crucial. Our economic performance is tied to quality of our surface transportation service and facilities, and we understand that deficit reduction is essential to sustain economic recovery. No one has any quarrel with that and we're all making sacrifices.

We do ask, however, that you recognize the importance of addressing what has become known as the third deficit, the deficiency of public investment in our people and our economic and physical infrastructure.

The National Governors Association supports preferential budget treatment for a few carefully designated productivity investments—human resources development, research and development for colleges and universities and industry, and investing in physical infrastructure in particular. These are all key to increasing both our international competitiveness and long-run economic growth.

The Governors unanimously adopted at our recent meeting a comprehensive surface transportation policy. And let me focus on several key points, particularly as they relate to the administration of the national transportation policy. State and local governments provide the vast majority of support for transportation. This financial commitment has expanded substantially over the last decade. In the case of the Commonwealth of Kentucky for instance, we furnish 81 percent of total highway funding in the state. The State commitment will continue, but the Federal Government must also increase its contributions to meet enormous unmet needs. This does not necessarily require a tax increase or any new money. The first step is full use of the Highway Trust Fund.

Virtually every governor supports the goal of setting the highway obligation ceiling for Fiscal Year 1991 at $15 billion. We sent a letter to the Budget and Appropriations Committee leadership signed by 47 governors. Committee Chairman Kay Orr and I also wrote personally to each member of the Budget and Appropriation Committees spelling out the impact of the change on each of their States. Setting the obligation ceiling at a level equal to annual trust fund receipts including interest is both fair and fiscally possible. It would provide a direct parallel between annual receipts and the basic State highway programs covered by the obligation ceiling.

Total obligations for the Federal Highway Program would be some $16 billion to $17 billion annually. This total includes the $15 billion obligation ceiling plus the cost of the programs outside the obligation ceiling, which are currently estimated at something like $1.8 billion for Fiscal Year 1991.

The Highway Trust Fund has more than enough room for raising the obligation ceiling to $15 billion, a 25 percent increase in obligations. The Department of Transportation concedes that a 35 percent increase in obligations is possible, and the General Accounting Office agrees.

When Speaker Foley met with us during the NGA Winter Meeting, he said we should use the Trust Fund for infrastructure investment to ensure that our future can remain competitive. The Speaker is right. This money was not collected to be banked; it shouldn't be used to offset the true size of the Federal budget deficit. Congress should put—to paraphrase the Governors—the trust back in the Trust Fund.

The National Transportation Policy developed by Secretary Sam Skinner calls for increased investment in transportation infrastructure, but who is to pay the bill when it comes due? Travelers, shippers, States and primarily localities.

Specifically, DOT would like to lower the Federal matching share on Federal projects to secure greater leverage on State and local and private sector funds. When Secretary Skinner talks about the high Federal contribution to individual projects ranging from 75 percent to 90 percent, this is only part of the picture. State and

local governments now provide an average of almost 80 percent of total surface transportation spending. States and localities contribute $63 billion of the $82 billion total that's spent each year.

There are four problems with lowering the Federal match. One, money would be diverted from maintenance and other State construction on the four million miles of roads in the Nation, diversion that we cannot stand at this time. Many of these are streets, roads and bridges, of course, in your districts.

Second, in the past five years, 39 States have raised their highway taxes, some more than once, reaching their current tax capacity. Many States have rates over $.20 per gallon, and they simply cannot levy additional gasoline taxes.

Third, States collect different amounts of revenue for each one cent per gallon gasoline tax. An example would be Kentucky and Texas. We charge the same gas tax, but the revenue collected in taxes in Texas from the same level of tax is five times greater than that of the Commonwealth of Kentucky—$17 million in Kentucky versus $85 million in Texas for each cent tax.

Fourth, State costs would rise with more projects subject to Federal requirements. Reducing the cost of Federal review should be a goal for reform of the program.

We're now at a crossroads. A substantial Federal role should continue—setting broad national policy and providing funding. But it's time for transition. The new highway program should address Federal investment priorities and broad goals and provide the States the flexibility that we need. Cooperating with local governments, States can provide the priority setting for vital facilities and services. With simplified administrative procedures, more flexible State funding options, and streamlined Federal programs, States can make maximum use of the limited resources that we have.

Finally, Governors have worked hard to promote voluntary State efforts to achieve regulatory and procedural uniformity. I cannot emphasize that strongly enough. We will strongly oppose the imposition of uniform procedures on truck registration and taxation programs in States. We will just as strongly oppose preemption of State authority over sources of State revenues, State tax bases, or taxation methods. In short, Governors believe that incentives to encourage achievement of national goals are more effective and productive than preemption and prescription.

I thank you very much for the opportunity to testify. We're ready to roll up our sleeves and work with you to implement a fair distribution of the burden we face in meeting the challenges confronting the Nation's transportation system, Mr. Chairman.

Mr. MINETA. Thank you very much, Governor Wilkinson, for your very fine statement. From what you have stated here that NGA does support preferred budget treatment for carefully designated "productivity investments" such as investments in the transportation infrastructure, can I infer from that that the National Governors Association would support the removal of the transportation or the Highway Trust Fund from the unified budget?

Governor WILKINSON. Well, we don't have that position at the moment, but there's a lot of talk about that and we're examining it. I think we would like to see what happens with the highway obligations ceiling this time. I have personally taken a position in

support, but the Association has not taken a position of going off budget at this time, Mr. Chairman.

Mr. MINETA. When that time comes, we'll probably be looking at both trying to take it off budget as well as to make sure that the trust funds are beyond the Gramm-Rudman-Hollings—imposition of its provisions. Mr. Governor, we would like to commend the NGA for their support for raising the highway obligation limitation to $15 billion. Although there is some support for increasing the obligation ceilings in the House, a much greater effort is going to have to be made, frankly, in the other body to make sure we get this higher level. In lieu of any new motor fuels excise taxes to increase funding for the Federal-Aid Highway Program, what level should the Highway Trust Fund balance be reduced to? Because you spoke about Speaker Foley speaking to the NGA talking about drawing against the Highway Trust Funds. And I was wondering in that regard what would be let's say a safe or good residue to leave as a balance in the Highway Trust Fund?

Governor WILKINSON. Well, certainly we believe that if the obligation ceiling is increased to the recommended $15 billion level at this time, that the balance left in the Trust Fund would be more than adequate. In 1973 the balance in the Highway Trust Fund was something like $5 billion. I think it currently is something like $11 billion. Concerning the balance left in the Trust Fund, that, of course, is a separate matter; but I would say that the Governors do believe that our immediate goal of attaining $15 billion in terms of the obligation ceiling would leave more than sufficient funding balances in the Trust Fund.

Mr. MINETA. The recently issued National Transportation Policy encourages the States to increase their non-Federal share for receipt of additional Federal funds. I'm wondering, do the States have adequate and sufficient resources to compete for Federal funds and still maintain an ongoing transportation program? For instance, just earlier, just before you testified we had folks from the General Accounting Office talking about maintenance programs. And so I'm wondering, in lieu of the demands that are being placed on the States, do you feel that there are sufficient revenues there at the State level to maintain an ongoing transportation program?

Governor WILKINSON. Mr. Chairman, stated a moment ago that 39 States have, in fact, increased their gasoline taxes and other revenue measures in the last five years. It would be our view that States do have sufficient revenues available for matching funds and to maintain and repair their highways—at the present matching level. Now I don't want to mislead you. The infrastructure in our States are in bad shape; there's no question about that. If the question is do we have the matching funds available to match a higher obligation ceiling, my response to you would be that if the Federal match is left at the current 75/25 ratio, the answer would be yes, we do. And I think we can say that with a very high degree of confidence. However, what disturbs us greatly Mr. Chairman is the talk about further leveraging those funds and simply spreading the Federal money across more highways. We do believe that that has the potential of having great damaging effect for the States in terms of monies available to maintain and repair our State roads.

Mr. MINETA. If the Federal Government had this carrot out here to say yes, here's this Federal funding that's available to the States, but they're also going to be saying we'll grant that money under some flexible conditions to those States that come up with more of their own funding as a proportion of the total cost of the project, would that unfairly then penalize maybe states that have great needs but maybe are because of economic depression not able to come up with the State share; and would that unfairly put them behind the eight ball in terms of trying to attract the very funds that they need to do either new construction or maintenance on their own programs?

Governor WILKINSON. I believe it would, Mr. Chairman. I think not only would it be unfair to those States that are economically depressed at present or have substantial areas of the State economically depressed, but I think it would be unfair to those States that have already increased their taxes to the point beyond which it's not possible for them to go.

Mr. MINETA. Well, I notice in Kentucky you raised your taxes in 1980 and then again in 1986.

Governor WILKINSON. That's correct.

Mr. MINETA. What is the gasoline tax now in the Commonwealth of Kentucky?

Governor WILKINSON. Fifteen cents.

Mr. MINETA. Fifteen cents per gallon?

Governor WILKINSON. Per gallon. Which is close, by the way, to the national average. There again, let me point out, Mr. Chairman, that in the Commonwealth of Kentucky we're financing 81 percent of all of the highway needs. So only 19 percent of our total highway expenditures are Federal funds.

Mr. MINETA. Now the 81 percent represents city, county, State——

Governor WILKINSON. All highway needs. And I might also add that many of us are producing a much greater local effort in different ways. For instance, in the Commonwealth we have just increased the use tax on automobile purchases by one cent which has added another approximately $50 million a year to the road fund. So we're not only increasing gasoline and diesel fuel taxes, but we're increasing motor vehicle use taxes, all types of fees and a number of other approaches to shore up our road funds. And, quite frankly, many of us, if not most of us, have done just about all we can do in that area.

Mr. MINETA. Your five-year capital improvement program as it relates to the highway program in the Commonwealth of Kentucky is what, roughly, approximately in dollars?

Governor WILKINSON. I'm going to say about $3 billion.

Mr. MINETA. Five years?

Governor WILKINSON. Yes.

Mr. MINETA. Five-year ongoing program?

Governor WILKINSON. Yes, as it relates to Federal projects. I may stand corrected on that, and I'll get the exact numbers, but I think that's approximately correct.

Mr. MINETA. Thank you very much. Mr. Shuster?

Mr. SHUSTER. Thank you, Mr. Chairman. We certainly appreciate your testimony, Governor. Some of us have been wrestling with the

notion that those States that have higher gas taxes or those States which are more willing to raise revenue for transportation should be rewarded more from the Federal Government. That is, to say perhaps we ought to provide greater funding to those States which raise more funds and less to those States that have not stepped up to bat. It's sort of a neat idea, but how does one implement it? I wonder what your thoughts are first on the concept and, secondly, if you have any suggestions as to how to do it.

Governor WILKINSON. Well, I think it just helps the rich get richer and the poor get poorer to use an oft worn cliche. I think it is unfair for those two reasons that we've just discussed, Mr. Shuster. Number one, many States are already at 20 cents or better and——

Mr. SHUSTER. That's my point. Maybe I didn't state it clearly. States that have the higher gas taxes should be rewarded because they're spending more money. This is not prospective, this is not to encourage States to increase, but, rather, simply those States that have the higher gas taxes should get more recognition from the Federal Government, more support.

Governor WILKINSON. Would that incorporate taking all sources of revenue into the road fund into consideration or just the gas tax?

Mr. SHUSTER. Well, I would think all sources of revenue. Those States that raise more money per capita——

Governor WILKINSON. That leaves remaining then the other problem, and that is that some of the States just don't have the capacity and the capability.

Mr. SHUSTER. You already have a 15-cent gas tax, don't you?

Governor WILKINSON. Yes, indeed.

Mr. SHUSTER. Which is very substantial. I would put you in the category of the good guys.

Governor WILKINSON. I understand. Some States just have more capacity to tax than others. An examination might be made of effort as it relates to capacity. I think that's really what you're speaking to—what is the effort and if it could be determined that States are making an equal effort based upon their capacity to tax, that might be worth examining.

Mr. SHUSTER. Thank you very much.

Mr. MINETA. Mr. Borski.

Mr. BORSKI. Thank you, Mr. Chairman. Governor, I'd like to follow-up on a point that my colleague from Pennsylvania was making. Would you be in favor of a Federal policy that would give a higher percentage of money back to States who raise a significant amount themselves?

Governor WILKINSON. As I've just said, if it could be based on effort and—I'm apprehensive about the formulas, all of these formulas that try to get at those things because they always end up being unfair to somebody. There's no question about that. But if there's some way to examine and compare the effort with capacity, that might be viewed as equitable.

Mr. BORSKI. I think what my colleague is trying to get at there are some States that are paying a significant amount and others who are paying a much lesser, and everyone gets the same Federal return. Perhaps we should look at that to find a better formula.

Governor WILKINSON. Well, excuse me. Most of us are getting what's been collected, aren't we?

Mr. BORSKI. I'm not sure.

Governor WILKINSON. Aren't we getting essentially what's been collected in our States? If it were paid out——

Mr. SHUSTER. Some States get more than they contribute, other states get less than they contribute. The concept is based on need.

Mr. BORSKI. Governor, just one other question if I may. There's an apparent need to spend more money for infrastructure, at least some people think so. The Secretary of Transportation in its policy seems to think that that money should be solely raised by the States and local governments. Would you agree or disagree with that?

Governor WILKINSON. I would disagree with it. Of course, the policy the last few years has been that states and localities need to raise it all. You're looking at a governor who believes strongly in the no money, no mandate philosophy. But let me make two statements about that. Local governments are turning to State governments now to fill the vacuum that's been created by lack of federal funding in the whole range of areas. So we're being squeezed from the bottom. And, of course, we're also hurting from the top because we're having all the mandates come down with no funding attached to them, and many, many, if not most, states at the moment are really hurting.

We have just increased taxes in the Commonwealth of Kentucky by $1.3 billion which is approximately 25 percent or more of our general fund. No one has ever done that quite that way at one time. But we've done it all. We've increased taxes by conforming to the Federal Tax Code, we've eliminated the deductibility of the Federal tax liability from our state tax return, we've raised corporate income taxes one percent across the board, we've raised sales taxes one percent, motor vehicle use taxes by one percent, and a whole host of smaller fees which we've just simply had to do. I mean, we absolutely had to refinance state government. But with the education and human resource mandates and our highway systems in such trouble, we have no choice.

So most of us are putting out just about the maximum effort at the state level that we can possibly put forth.

Mr. BORSKI. So if there were increased monies needed for infrastructure, you think that the Federal Government should pick up that share?

Governor WILKINSON. Indeed I do; beyond where we are now. Certainly.

Mr. BORSKI. Thank you, sir. Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much. Mr. Hancock?

Mr. HANCOCK. About the only comment I would like to make is that in line with the last statement that the Federal Government should pick up the share. You know, that still comes from the same source, whether the Federal Government's getting it or whether you're taxing it at the state level, it still comes from the citizens within your state. So do we really want the Federal Government to tax it, take their share out of it and send it back, which you'll end up getting less money?

Governor WILKINSON. Mr. Hancock, what I think we want right now is the money that is already owed to us, paid to us. If we can begin by raising the obligation ceiling to $15 billion and if we can get on a cash-in/cash-out basis plus interest in terms of the Highway Trust Fund, that would mean an additional $50 million to the Commonwealth of Kentucky alone next year. If we could start there, no new money, no new taxes, just being able to utilize what we feel is already owed to us and is already there and available in the Trust Fund, that would be a marvelous beginning and that would, indeed, as a practical matter be increased funding because it's monies we desperately need and we don't have now.

Mr. HANCOCK. Well, I think you'll find that this side at least has been advocating for quite some time that the Highway Trust Funds be released. In fact, I've only been in the Congress a very short time, but I've been a little confused about why we can't get that money released. And, in fact, the Highway Trust Funds, the Aviation Trust Funds, this other money that the American public has paid in, I hear a lot of conversation, but I'm still confused about why we can't get that money used the way it was supposed to have been used. But we're working on it. You can rest assured to that.

Governor WILKINSON. Mr. Hancock, you're not alone in your confusion about that I can assure you.

Mr. HANCOCK. Thank you.

Mr. MINETA. Ms. Molinari.

Ms. MOLINARI. No questions.

Mr. MINETA. Well, Governor, thank you very much for your work, and I want to have you extend our thanks to Governor Orr as well in her efforts and the Committee's efforts there at the NGA. Thank you very, very much.

Governor WILKINSON. Mr. Chairman, you're very kind. Thank you very much.

[Governor Wilkinson's prepared statement with attachments appear on p. 1968.]

Mr. MINETA. At this time I'd like to call forward a panel made up of the very distinguished Mayor from the City of Philadelphia, Wilson Goode, representing the U.S. Conference of Mayors; and the Honorable Verna Clayton, Mayor of Buffalo Grove, Illinois, who chairs the Transportation and Communications Committee for the National League of Cities. I believe that Mayor Clayton will be accompanied by Councilman Jim Bell of San Jose who I'm proud to say when I was Mayor of San Jose, I appointed Mr. Bell to the Youth Commission. I'll tell you, this is when I get to feeling old when someone I've appointed to the Youth Commission is now a very distinguished member of the City Council as Jim is in San Jose, and I'm very proud to have had some little part in encouraging him into public service.

Mr. Mayor, it's good to have you here. Your statement will be made a part of the record, and we will go ahead and proceed.

At this time I'd like to call on my very fine colleague from Pennsylvania, Mr. Borski.

Mr. BORSKI. Thank you, Mr. Chairman. I just wanted to take this opportunity to welcome Mayor Goode to our hearing. I am very interested to hear your testimony. We have severe problems in Philadelphia with public transportation. I think as you listened to my

earlier questioning, I think part of it is the Federal Government is not maintaining its share of subsidy to mass transit. I think it's very important, particularly with the Clean Air Act that we're passing through Congress now. There's not a better way to reduce and help our air quality than it is to increase our funding in public transportation. So I am most pleased to have you here and to welcome you here, Mayor, and look forward to your testimony.

TESTIMONY OF HON. W. WILSON GOODE, MAYOR OF PHILADELPHIA, PA, ON BEHALF OF THE U.S. CONFERENCE OF MAYORS

Mayor GOODE. Thank you, Congressman. Mr. Chairman, members of the Subcommittee. On behalf of the U.S. Conference of Mayors, I thank you for the opportunity to testify here today. As you know, the Conference of Mayors represents more than 800 mayors in this country serving cities with populations exceeding 30,000. We represent urban America. I am extremely pleased to share today's panel with my colleagues from the National League of Cities. Between us, we represent 16,000 cities and towns across the country.

Let me begin by telling you something we all know too well. Urban and suburban America are gridlocked by cars, trucks and other vehicles on our roads. That gridlock has an enormous impact on the viability and longevity of our Nation's highways, roads, streets, bridges, rail and mass transit infrastructure. Stories of crumbling infrastructure have become all too familiar; yet, the question remains, how do we meet the national need for safe and efficient movement of people and goods? Mayors hope a large part of the answer to that question will come from this Committee's reauthorization to Surface Transportation Act.

Mayors seek your help in meeting the needs that we face on a daily basis at the local level. The completion of the interstate highway system presents a great opportunity to reassess and redirect Federal surface transportation policy. We believe that this policy must be devoted to, one, eliminating gridlock; two, relieving congestion and its adverse environmental consequences; three, enhancing public transportation; four, maintaining our national investment in roads, streets and bridges; and five, making advances in technology to enhance efficient and safe travel.

At our annual meeting last June in Charleston, South Carolina the Conference adopted a policy for the Post Interstate Era. A copy of our policy resolution is attached to my testimony.

This policy addresses the goal of improving mobility in American society. Specifically, it addresses the following needs:

1. Continued dedicated transportation funding and spending down the surplus in the Highway Trust Fund.
2. Maintenance of the interstate and primary highway systems.
3. Give more attention to the value of mass transit in heavily populated areas and a level playing field in the tax treatment of employer-provided mass transit benefits versus the tax-free treatment of parking benefits.
4. Enhanced flexibility in Federal funding options.
5. A separate and enhanced bridge program.

6. Greater emphasis on the consistency of environmental and transportation policy.

Mr. Chairman, much of what the U.S. Conference of Mayors is seeking in a National Transportation Policy is comparable in large part to the goals announced earlier this year by U.S. Secretary of Transportation, Samuel Skinner. We want to work with the Secretary to fashion a National Transportation Policy which will meet the needs of America's cities today and into the future. When I saw the National Transportation Policy, I asked the question every child asks himself when a new toy arrives at Christmas: Are the batteries included? Is there any juice in the policy?

The Conference of Mayors has joined with state and local elected officials to form Project 15. This project is seeking a $15 billion appropriation in Fiscal Year 1991 from the Highway Trust Fund. The $15 billion figure is a pay as you go expectation of what the Highway Trust Fund will take in during the year in gas tax revenue and accrued interest. Project 15 is devoted to putting the trust back into the Highway Trust Fund.

As Mayor of Philadelphia, I'm proud to embrace the policy initiatives of the U.S. Conference of Mayors. They are high on my city's agenda. I would, however, like to take a moment to highlight some specific items of interest to my city.

One aspect of Secretary Skinner's policy that I heartily applaud is the use of Federal transportation assistance to leverage greater involvement by state governments in providing mass transit assistance. Seventy percent of the 285,000 Center City Philadelphians depend on public transportation to get back and forth to work. Thirty-eight percent of Philadelphia households do not even own an automobile. Philadelphia has the fourth largest public transit system in the Nation, yet there is no dedicated source of revenue authorized by the State to support this transit system, a system which is vital to our city's economy and environment. This must change. And if it takes Federal leverage to effect a change, then so be it.

Mr. Chairman, reauthorization of the Surface Transportation Act will follow close on the heels of a newly reauthorized Clean Air Act. There are elements of the Clean Air Act making its way to passage in the House and Senate which are of vital importance to urban America. We can no longer afford to run environmental and transportation policy planning on separate tracks. Clean air and mobility are both vital to urban economic growth and stability. Environmental and transportation goals need not be incompatible and, therefore, planning to achieve those goals must be coordinated. We cannot, Mr. Chairman, rely solely on auto emissions reductions to achieve clean air. Expected increases in the number of vehicles on our roads will eventually erode the gains made through tighter emissions standards.

Provisions contained in the Clean Air Act designed to reduce vehicle miles traveled under review by the Public Works and Transportation Committee are deserving of support.

Finally, Mr. Chairman, I applaud the efforts of this Committee to make full accessibility to public transportation a reality for all Americans by ensuring access for those who are disabled. I urge the Committee to ensure that adequate resources are available to

public transit providers so that they can meet this mandate while maintaining affordable service to the many Americans who rely on public transportation.

The reauthorization of Federal surface transportation programs will be high on our agenda on our 58th Annual Meeting of the Conference of Mayors in Chicago in June. We look forward to that meeting and to working with this Subcommittee as it creates a new policy for a new era in Federal surface transportation assistance. Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. Mayor. Let me at this time call on Mayor Clayton of Buffalo Grove, Illinois

TESTIMONY OF HON. VERNA CLAYTON, MAYOR, BUFFALO GROVE, IL, ON BEHALF OF THE NATIONAL LEAGUE OF CITIES, ACCOMPANIED BY JAMES BEALL, NATIONAL LEAGUE OF CITIES

Ms. CLAYTON. Thank you. In addition to being Mayor of Buffalo Grove, which is a Chicago suburb, I am also President of the Illinois Municipal League.

Joining me today, as you indicated, is Jim Beall. And we want to thank you, Mr. Chairman, for getting him involved in politics because we certainly have benefited from his input as Vice Chair of our Transportation and Communications Steering Committee at the National League of Cities.

I am testifying today on behalf of the 16,000 cities and towns represented by the League and our State Municipal Leagues. We appreciate your leadership in holding these hearings and this Committee's continued understanding of and support for the challenges faced by local officials in providing the best possible services to our residents at the lowest possible cost.

As you know, local officials face the enormity of our Nation's public works needs every day. Congested and often inadequate roads, potholes and crumbling bridges are daily stories in our cities' suburbs and rural areas. That is why we were so pleased that it was determined to draw up a comprehensive plan for our Nation's infrastructure. Our high hopes were dashed, however, by the final plan which recognized the tremendous needs of our Nation's transportation systems but it also lacked the resources devoted to solving the problems that were highlighted in the report. The good news in the plan was the attention it focused on our growing transportation and infrastructure needs, but we believe that the plan is shortsighted in its vision of state and local governments shouldering the majority of the infrastructure burden.

Giving local governments greater flexibility to spend money raised locally is not our vision of a unified Federal approach to solving our Nation's infrastructure needs. Further, we were distressed by the plan's proposed designation of a system of Highways of National Significance. From our perspective and the perspective of our citizens that face massive congestion delays on roads choked with local and interstate traffic, we are concerned with the impression that roads not on a so-called system of national significance are to be considered insignificant.

Most distressing to local officials was the message that local governments have to begin carrying their share of the responsibility and do more to build our Nation's transportation system. The facts show that local governments have been raising and investing local dollars in transportation programs, while the Federal Government has been declining its responsibilities. The Federal share has reached its lowest level in 27 years, while the local share has risen from 41 percent to 53 percent. Between 1984 and 1987 the Federal share dropped from 31 percent to 23 percent. The state share from 29 percent to 24 percent. We are also disappointed at what was left out of the report. A Federal commitment to draw down the large balances in the Aviation and Highway Trust Funds, addressing congestion problems that threaten the economic growth of our communities, and the need for greater equities in our tax code which currently favors fringe benefits for parking rather than our clean air goal of encouraging greater use of mass transit through tax breaks for employer-provided mass transit passes.

We were encouraged by this Committee's reaction to the plan and hope that we can work together to develop a more realistic approach to our Nation's needs.

In order to just maintain the physical characteristics of the Nation's public sector surface transportation infrastructure at today's service levels through the year 2000, AASHTO estimates nearly $95 billion is required. Highway needs they predict are $80 billion, while transit requires an estimated $15 billion to meet future needs. AASHTO further projects that an additional $1 billion per year in constant dollars in highway and transit through 2020 would be required to adequately link surface transportation with airports, ports and waterways, and rail terminals. Constructing these intermodal connections will be critical if this Nation is to compete in today's competitive global economy.

In response to these mounting public service costs, local governments have diversified and expanded local revenue sources raising non-property taxes, including user fees and developer fees. We can only do so much. Local income and sales taxes to a certain extent have proven to be successful revenue raisers. However, many communities are constrained by state-imposed property taxing caps. Today 32 states have caps on local taxing, and 46 states cap bonding which is especially troubling for smaller municipalities with limited tax bases.

I'd like to turn now to Jim to discuss the National League of Cities surface transportation initiatives. He chaired our task force which has been working on this for the last two years. Jim.

Mr. BEALL. Thank you, Verna. The National League of Cities has developed an initiative for the Surface Transportation Program that calls for the Federal Government to redirect the national transportation priorities to the urban and suburban areas of the country. The initiative is based on the following objectives: maintaining a healthier national economy by improving mobility in urban and suburban areas; promoting an improved quality of life for our country's citizens by improving traffic congestion and safety, air and visual quality and energy conservation; meeting the mobility needs of the transportation dependent, such as the disabled and elderly, by providing a base level of transportation serv-

ices; having flexibility to invest in technologies to develop cost-effective solutions to our Nation's transportation problems; and maintaining past Federal investments in transportation.

This new partnership should include the following program structure element: First, simplify and consolidate the categorical programs into three basic programs:

One, a 4R and bridge program which the major focus of this program is to maintain the existing system;

Two, an urban and suburban component. This program recognized the needs for a coordination in metropolitan regions. Federal funds would continue to be allocated by formula—FAU for highways and Section 9 for transit. In addition, a flexibility component of this program would allow for additional funds to supplement the formula programs to better meet highway and transit needs. Funding for this flexible component should be allocated to the states with a mandatory pass through two cities or metropolitan planning organizations with populations above 200,000; and

Three, a rural program. This program would focus on maintaining and improving rural access.

Further, increased funding for highway and transit should come immediately drawing down the unspent balance in the Highway Trust Funds and reallocate $3 billion annually appropriated to the interstate construction fund following its completion. That's the Project 15 the Mayor referred to. And we very much appreciate the Committee's leadership in this area.

Simple and flexible policies are required to fashion solutions unique to the changing demographics of our Nation. We need to better coordinate across modal lines, across jurisdictional boundaries, and across traditional separation of public and private responsibilities to maximize the network now in place.

Local governments have recognized this unique opportunity to evaluate the tremendous successes of our Federal surface transportation system and plan for the future. Towards that goal, the organizations representing local governments have met to form a consensus on the outlines of the new Surface Transportation Program that would best serve the needs of our citizens. Local officials representing National League of Cities, U.S. Conference of Mayors, National Association of Counties, National Association of Regional Councils and American Public Transit Association met earlier this month and agreed on an approach that incorporates the need for local decisionmaking, increased flexibility in funding, and a consolidation of the Federal Highway Programs to make them more efficient.

We believe it represents a step forward to enhancing our Nation's transportation needs, and we look forward to working with you in putting together the surface transportation plan for the next century. Thank you.

Mr. MINETA. Thank you very much, Council Member Beall and Mayor Clayton. Mayor Goode, if I may ask, one of the most—one of the things that most Americans cherish is this freedom of mobility. How can the consolidation of an urban metropolitan system that emphasizes funding for urban roads and transit systems enhance that mobility?

Mayor GOODE. Well, it is essential, Mr. Chairman, that we have that. One of the things that we have learned is that as people have found the outlying suburban areas that business is and corporations and jobs are cropping up all over a region. We recently did a study in Philadelphia, the Philadelphia region that talked about just the impact of mass transit of highways and the whole network of highways in the region. And we found that if we did not, in fact, continue to improve the mass transit network, the highway network in the region, there would be an absolutely direct impact upon the economic viability of the region, that literally millions of people each day move back and forth to jobs in the region. There is within Philadelphia region, as you know, about 3.1 million people, and to move those people back and forth between the jobs is absolutely essential in my view.

Mr. MINETA. Under the National Transportation Policy that was recently released by the Administration, Mayor Goode, the policy encourages the use of Federal transportation assistance to leverage greater participation by state governments in providing mass transit assistance. Would this proposal have the effect of precluding urban areas that lack local resources from participating in the mass transit programs as you've pointed out to address your own transportation needs?

Mayor GOODE. Your question—would it preclude—would you repeat your question again? I think I may have misheard what you asked.

Mr. MINETA. Under the transportation policy that was issued by Secretary Skinner, they're trying to encourage the use of Federal transportation assistance to leverage greater participation by state governments to assist local governments in terms of any mass transit assistance. Now, as they try to do that, I'm just wondering whether or not this proposal has the effect of precluding urban areas that lack local resources from participating in the mass transit program.

Mayor GOODE. I don't think so, but let me if I could cite an example which I cited in my testimony. And that is that Pennsylvania does not have a dedicated source of funding for its mass transit. We believe that that is absolutely essential. We believe, therefore, that if there is some type of requirement in the law that says that states must have a dedicated source of funding for mass transit, then it helps those states which do not have, and Pennsylvania is one of the few states that does not have a dedicated source of funding, it would help us to have increased support where local governments could assist in solving their problems.

Now, there may very well be with a law like that that could end up in some regions of the country having an adverse impact. But from what I know as a personal example, it would be of immense help to us in the Southeastern region of Pennsylvania.

Mr. MINETA. Mayor Clayton, let me ask, under the National Transportation Policy statement that, again, was issued by Secretary Skinner and President Bush, it calls for an increased investment in transportation by state and local governments and the private sector by expanding the range of available tools and choices. From your perspective, what tools and choices do local govern-

ments have available to them to increase these investments in transportation?

Ms. CLAYTON. As I had indicated in my testimony, one of the tools that we had been using in our area particularly is the developer fees. We're in a rapidly growing area and it is obvious that the developer should help pay the bill for the impact that they are making on the region. So that is one way.

Also, in Northeastern Illinois we have a great many toll roads, and that is another way of raising the source. When you get past those two sources, property tax is what is available to us, and already our property owners are certainly overburdened. So we would have to look to our motor fuel tax and the developer fees to help take up that slack.

Mr. MINETA. Are there any local initiatives, for instance in Illinois, to increase state sales tax or any other kind? Let's say—not excise tax—let's say, state sales taxes that you could do, that you can raise on a local basis?

Ms. CLAYTON. No. However, in Illinois within the last year they did increase the motor fuel tax which does come back, a portion of it comes back to the local governments for us to be able to use. There's also a congestion fund. They're having an Operation Green Light to be able to help with the urban suburban congestion that we're experiencing.

Mr. MINETA. Councilman Beall, in pointing out the National League of Cities Post Interstate Program, you're recommending a consolidation and simplification of selected categorical programs into three highway programs. And I'm wondering has the National League of Cities in developing or at least in consolidating these categorical programs into three highway programs, have you thought about how those would be apportioned under these three recommended highway programs?

Mr. BEALL. Well, we're at a point where we're talking about it between the various groups. We've looked at the various needs assessments, and we think needs assessments can be done to show where the apportionment should take place, including needs assessments done by the Federal Department of Transportation.

Mr. MINETA. And if additional Federal funds are not made available by drawing down against the Highway Trust Fund balances, what kinds of alternatives if I might ask the three members of the panel—what kinds of alternatives are available for local government to reduce traffic congestion in urban areas, Mayor Goode?

Mayor GOODE. Well, the only alternative would be for states to tax themselves, local government to tax themselves for this purpose. And I think that as the Governor of Kentucky said earlier, and I will repeat to you that many of us are simply taxed out at this point. May I just make one point on the last question you asked which I got clarified by one of the staff people here. I did not fully understand the question. Let me say that as we talk about Federal Government leveraging our states and local government to do more, we also need for the Federal Government to stay actively participants in this funding mechanism. They cannot abandon local and state transportation systems with this policy, and we need them involved as well. But I don't know of many other options

other than for state and local governments to tax themselves. And we are at this point about taxed out, sir.

Ms. CLAYTON. I guess I would just piggyback on that. I think the economic vitality of our country really rests in our cities, and it is extremely important that we maintain the good transportation network so that we can move the people and goods. I think that because it is a national policy, there must be a Federal investment in that. I believe the local people should and would work in a partnership with the Federal Government in taking care of the congestion that we are experiencing.

Mr. BEALL. Most of California's efforts are concentrated, of course, on the pending ballot measure, and we've been trying to increase our gas tax; and at a local level, increasing our sales tax in 14 counties already. One of the problems we're finding in the campaign for increasing the gas tax is well, you're not spending the money that you already raised at the Federal level. How come we're going to increase the taxes here in the states or the local areas if there's this big pot of money in Washington that they're not letting you spend on transportation programs?

So it makes it more difficult to increase local taxes if the money is not being used effectively.

Mr. MINETA. Thank you. Mr. Duncan.

Mr. DUNCAN. Mayor Goode, I have to tell you that I was in Philadelphia Sunday night—Philadelphia, Tennessee in my district; it's a little different. I guess there's two or three hundred real good people in my Philadelphia. But I'm pleased to have you here with us today.

Mayor GOODE. Some days I wish I had two or three hundred, sir.

Mr. DUNCAN. I bet. Would the U.S. Conference of Mayors or the National League of Cities do you think support a program where cities who are willing to provide more of these funds or tax themselves more are awarded in the Federal Aid Highway Program? Any of you who want to answer that? Do you think we should put some type of incentive like that into the highway legislation?

Ms. CLAYTON. We do not have a policy on that at the National League of Cities, but I would like to speak to that just from the Chicago Metropolitan area, and that was if you recall a while back, there was some lobbying done to permit us to be able to provide a larger share on the local level to make our Federal dollars go further, and we were successful. And many of the communities in our area are doing that. But I would like to point out, as Mayor Goode did, that—perhaps it was the Governor who said the rich get richer and the poor get poorer, and I think we must be vigilant to keep that from happening.

Mayor GOODE. The U.S. Conference of Mayors' policy is no, we would not support that. We believe that it should be equalized, and we think that when you start to—this city and this city here we're going to treat you differently, that we end up with major problems. There is, in my view, something called capacity to pay. And I think that the Governor talked about effort, and I think some cities can't do as well as other cities can do, and I don't think they should be penalized because of that.

Mr. DUNCAN. You know, I'm sure all of you know that the Federal Government is over $3 trillion in debt now, and we're operating

at huge astounding debts, and with this savings and loan crisis going completely beyond anybody's imagination, the Federal dollars I'm afraid are going to be in shorter and shorter supply. And, yet, everyone who comes here, you know, says we've got to increase the Federal share and certainly all of us agree that we want to have the best highways and the best transportation system we can. But do you have any suggestions or what do you propose about where we get this money?

Mayor GOODE. Well, it seems to me, Congressman, that we need to look at priorities. I'm not sure how much we can get from the downscaling of our military because of the meltdown in the Cold War, but I would suggest that through some type of peace dividends, through some type of downscaling of military weaponry that we might be able to look at that source of monies for some highways.

Secondly, I don't know whether or not the mobility of our people is less important than the bailing out of savings and loans. I will not get into that. I'm attending here now a conference on drugs. I know it is not more important than fighting the war on drugs, but I think that we need to look at not necessarily more money, but how we spend what we have now. Each year the Feds are spending money on something. I think that we can spend those dollars a little differently would be my suggestion.

Mr. DUNCAN. My father many years ago was Mayor of Knoxville, and I personally think that being mayor of a large city is a tougher job than being in Congress.

Mayor GOODE. You can bet on that, Mr. Duncan.

Mr. MINETA. I can attest to that very much, having been in both spots.

Mr. DUNCAN. I think this is a very tough job also, but let me ask you this—it's something that I guess is a little tough to talk about, but the greatest pressure that I can see on mayors and on other city officials comes from city employees. While a case can be made that they're underpaid and anybody can make comparisons to baseball players or actors or singers or whatever and say that they're way underpaid, and I wish that—I sincerely wish that all of our public employees could make far more than they do. But the fact is, the public employees, particularly city employees, their salaries have escalated greatly in recent years percentage-wise. Now, are there any efforts being made in the major cities to resist those types of pressures or to hold down the cost of city government so that—in other words, where are the priorities? If you had to rate your priorities in your cities, do we still need to spend more and more on the city employees' salaries, or do you think transportation has become the number one or even in the top three or four of priorities of various city and local governments? What would you say about that?

Mayor GOODE. If I could respond to that, you make I think a valid point. That is, those of us who run cities must also look at more efficient spending of local tax dollars, and we negotiated two years ago a four-year contract with our labor unions with a zero increase in wages up front with a cap on the health and welfare benefits, with changing in work requirements and technology and equipment so that we could get more bang for our buck.

Just for an example, we were able to in that process to reduce our sanitation division by 500 employees and at the same time, increase our productivity. That's one point. The second point is that we have to look more at public-private partnerships. That is, how do we take some public efforts, involve the private sector in those efforts to improve the overall efficiency of those operations.

And, thirdly, we must also look at what things do we now do in Government can best be done by agencies outside Government, and we have done that as well by taking our golf course, for example, and turning it over to a private operator—civic center to private operator. But I don't think that we can do anything with the money left over from that other than to deal with the problems of homelessness, of AIDS, of increase in crack cocaine in our cities, and I don't see the Federal Government coming forth in any significant way helping us to solve those problems.

So as we have seen a more efficient management in our cities, the savings from that management must be used to respond to the serious social problems facing our cities. I don't think that we can use those dollars for highways.

Mr. DUNCAN. Well, let me say this first of all, I agree with everything you said. In fact, I think it was a very fine statement that you just made. Two more questions that I'll put together and any of the three of you can respond. Do the Federal dollars that your cities get now from whatever source come with too many strings attached? And what I'm thinking about my good friend, Governor McWhorter from Tennessee came up here last year and told the Tennessee Congressional Delegation, said, please no more Federal mandates; too many mandates on the states. Do the cities feel the same way? Are there too many Federal requirements or mandates or strings or whatever? And, secondly, tied into that—and you were starting to get into it, Mayor Goode, where does all this that we're talking about now rank? I'm not asking for an exact listing, but do the problems of transportation and mass transit—would any of you rank them in the top five, let's say, of the problems that your cities face? When you talk about AIDS, you talk about homeless, you talk about low-paid city employees or taxes that are too high; where would you rank these things?

Ms. CLAYTON. In the suburban Chicago area I would rank traffic congestion as our number one problem. It is—which is why I've become as involved as I have in the issue. If I could just piggyback on your question before that because our employees, I believe, are very important to us. The services that we deliver to our residents really are only as good as the people we have delivering those services. So we must maintain a good work force.

However, I think that the funds that we use to pay those are not the same funds that we would be using on highways. User fees, motor fuel tax money are the funds that are used for the highways. And I know that here in Congress there have been a number of moves afoot to try to use the Highway Trust Fund for other uses to balance the deficit.

Mr. DUNCAN. But the point, though, that I was making a while ago, Ms. Clayton, is that as far as a city or a local government goes, it's all one big pool really, the money is. I mean, money that you

don't use one place could potentially be used someplace else. As far as your own local funds go.

Mayor GOODE. Well, it's not just one big pool, sir. I believe that over here you have your operating budget where you deal with these social problems. And there are special types of things like sales tax and gasoline and liquid fuel tax that you can use for highway fund. They are in a sense different in my view. But let me just make this point, that without the ability of people to move around a city, without the ability to move goods and services around a city around a region, the city, the region dies. And I don't know how you rank that, but it seems to me it is the very essence of the economic viability and vitality of a city in a region. And if you take that away, then you don't have what I think is the heart of America now, which is viable cities and viable regions which make in my view this whole country tick.

Mr. DUNCAN. Thank you very much.

Mr. MINETA. Mr. Borski.

Mr. BORSKI. Thank you, Mr. Chairman. Mayor Goode, once again I want to thank you for your testimony. There was much in here that I was in full agreement with. I did want to ask you one question about a dedicated source of revenue from the Commonwealth of Pennsylvania for mass transportation in the Philadelphia region. I agree with you and I have co-sponsored legislation introduced by Congressman Gray to help that Federal leverage to get that dedicated tax, but I also understand that Governor Casey believes that he has increased the amounts of money for mass transportation significantly and that the real problem seems to be at least from his point of view that the Federal Government is not maintaining its share. While in agreement that a dedicated source of revenue is needed, isn't the bigger problem today the amount of money that we're losing from the Federal Government?

Mayor GOODE. We need increased support from the Federal Government without question, and certainly the decrease in support of mass transit from the Federal Government in the past has been a big, big problem, and certainly the Commonwealth of Pennsylvania has indeed increased funding to local mass transit; but while we say that, there must be the ability provided for the local Governments to also help themselves. And what we're asking for is not for the Commonwealth necessarily to provide more dollars, but to provide the ability on the part of local governments to help themselves. And I think you need all three. And without having all three, you end up having an insufficient system and having systems like the SEPTA system in Southeastern Pennsylvania go from crisis to crisis every other year.

And so there is very much needed in my view a dedicated source of revenue for local mass transit systems around this country. Pennsylvania is one of the few states where you have a major system like the SEPTA system where you do not have a dedicated source of taxes or revenue for that system.

Mr. BORSKI. Mayor Goode, I think it's worth noting because there may be some question about the amount of money paid in the fare box. Would you inform our panel what the city riders in the SEPTA system pay?

Mayor GOODE. It's $1.25. The reason I was asking was is that we have a proposal in place now to take it up to $1.50. That is the highest fare box cost in the entire country.

Mr. BORSKI. So there's no question that the local riders are paying their fair share?

Mayor GOODE. The local riders are paying their fair share; about 63 percent of the total cost of the system comes from the fare box. That's the highest in the country again.

Mr. BORSKI. And I know there's been discussion about perhaps trying to increase that again. I know you're not directly involved in that, but I thought the point was well made that the city riders pay a very, very high percentage of the fare box. The President had suggested earlier the elimination of the operation subsidy for cities over a million people. What kind of effect would that have on the SEPTA system?

Mayor GOODE. Devastating. Devastating. It would be a catastrophe.

Mr. BORSKI. And the only other question I wanted to ask, and perhaps, Mayor Clayton, you may want to respond to this, too—is in your statement you suggested that the Federal share has reached its lowest level in 27 years, and you also had started to I think respond to an earlier question from my colleague from Tennessee about where we go for new transportation dollars if they're needed. And you started to talk about user fees. If there is money needed, isn't the simple way to do it is to increase the gasoline tax or a user fee specifically for transportation costs?

Ms. CLAYTON. According to the reports that we have all received, fragile foundations and so forth, it's showing that we really need to double the investment in our infrastructure in order to meet the needs. And I am a firm believer in user fees. I think we need to protect the Trust Fund that we already have and not let that be used for any other purpose. I think we need to draw down on that. I think that what we will be looking at is that the money that is presently being used for interstate construction can be then reallocated out to address some of the needs that we are looking at. And then if, in fact, an increase in the user fee has to be considered if I think we must. I think that we probably haven't done a real good job in selling this to the user. I think that if they were to look at the costs that they have with operating their automobile, the cost of their car, the cost of their insurance, that the amount that they pay in motor fuel tax is a very small percentage. And I don't know where they think the roads come from, but they have to be paid with something and I think they should be paid by the people who use those roads.

Mr. BORSKI. Do you also think that the public transit percentage is fair or could be increased or should be increased or should come out of that fee?

Ms. CLAYTON. I think that the transit has to be considered right at—when an urban area is looking and addressing their congestion problem, that mass transit has to be a definite portion of that. I think that in the suburban areas which I come from where the densities are different from in the urban area, that perhaps we're going to have to be looking at more innovative and creative ways of mass transit—not the traditional bus going down the street. But I

think that we have to be addressing it, we have to get people out of their cars. So, yes, I think it must be paid for with that also.

Mayor GOODE. And the U.S. Conference of Mayors totally agree with that, and I absolutely agree with that as Mayor of Philadelphia, and we really have to look at ways to do so. On Earth Day in Philadelphia the head of our SEPTA system took and lined up about 30 cars. And he had one bus there that says that essentially you can take all these people out of these cars, put them on this bus and you can have cleaner air as a result of it. Again, I'm trying to make the point I made in my statement. We ought to look at the cleanliness of our air along with mass transportation and with our transportation policy and try and link those two directly together.

Mr. BORSKI. Mr. Beall.

Mr. BEALL. Just on that air quality issue, I think we're finding that decisions are being made in the Federal courtroom on the air quality issue telling us how we can or cannot spend our dollars to deal with transportation, and I think there's a great fear that if we put all our eggs in the interstate basket, we won't be able to spend any of that in the areas that have high air quality problems.

Mr. BORSKI. One final question; again, all of you may answer if you wish. That is, each of you have strongly suggested spending down the Trust Fund, and I think that is very much appreciated. The National Transportation Policy I think goes a step further and says that if more money is needed, that it should come from state and local governments. Do you agree, disagree? For the record.

Mayor GOODE. For the record, I think we can all say in unison we disagree. We can even do a song on that—we disagree, we disagree, we disagree.

Mr. BORSKI. Thank you very much.

Mr. BEALL. The Bay Area we're at 60 percent on highways and 71 percent on transit for new construction. So I think we're getting blood from a turnip right now.

Mr. BORSKI. Thank you very much. Thank you, Mr. Chairman.

Mr. MINETA. Mayor Goode and Mayor Clayton, Council Member Beall, thank you very, very much for being here representing the U.S. Conference of Mayors and the National League of Cities. And I can attest to what a tougher job it is, frankly, in local government than it is to be here in the Congress.

Ms. CLAYTON. Thank you for the opportunity.

Mayor GOODE. Thank you, Mr. Chairman.

[Mr. Goode's prepared statement appears on page 1753.]
[Mr. Clayton's prepared statement appears on page 1726.]

Mr. MINETA. I would now like to call on Bart Barker, County Commissioner, Salt Lake County in Utah, who chairs the Transportation Steering Committee for the National Association of Counties. Mr. Barker, your statement on behalf of NACO will be made a part of the record. And so if you would go ahead and proceed in your own fashion and introduce your colleague if you would please.

TESTIMONY OF HON. BART BARKER, COUNTY COMMISSIONER, SALT LAKE COUNTY, UT, AND CHAIRMAN OF THE TRANSPORTATION STEERING COMMITTEE OF THE NATIONAL ASSOCIATION OF COUNTIES, ACCOMPANIED BY ROBERT FOGEL, LEGISLATIVE REPRESENTATIVE ON TRANSPORTATION ISSUES, NATIONAL ASSOCIATION OF COUNTIES

Mr. BARKER. Thank you, Mr. Chairman and members of the Committee. Robert Fogel who is the legislative representative on transportation issues for the National Association of Counties is to my left.

I appreciate the invitation to present this information before the Subcommittee today. As I was coming over this morning, I stopped by a hearing of the Commerce, Consumer Protection and Competitiveness Subcommittee of the House Energy and Commerce Committee, and heard testimony indicating that in Japan the investment in capital needs is 24 percent of the gross national product of Japan. In the United States it's only half that level. So I think what the Committee is looking at today is very appropriate to addressing many of the national needs we have in this country, including competitiveness.

I chair the National Association of Counties Transportation Steering Committee. I'm also a County Commissioner in Salt Lake County, Utah, which is an urban county in a generally rural state. For the last year and a half members of the Transportation Steering Committee have been working to develop a transportation policy to address the post-interstate era. Last month the NACO board of directors adopted a policy which is attached to my testimony for your review.

Completion of the interstate system has driven National Transportation Policy for the last 30 years, and it is now essentially completed with the exception of a few gaps. The resources that have supported this massive public works undertaking may now be directed towards other national transportation priorities. Defining the appropriate Federal role in the post-interstate era will be a critical process affecting every citizen, every level of government and every business in the United States. It will also affect our Nation's ability to compete in a global economy.

The new surface transportation program must make economic development of urban, suburban and rural areas the key factor in making transportation decisions. The economic health, vitality and competitiveness of the Nation is being threatened by increasing urban and suburban congestion and a failure to meet the access needs of rural areas.

Congestion adds billions of dollars to the cost of moving goods, services and people in urban and suburban areas. In our rural communities underinvestment in highways and bridges and the resulting deterioration make it more expensive to move commodities and discourages new economic activity. These are issues of national concern and we hope the Congress will view them as such when considering proposals to establish new transportation policy.

I'd like to talk about intergovernmental partnerships for a moment. As this Committee begins evaluating what the new Federal transportation system will look like in the post-interstate era,

we urge you to take a close look at the intergovernmental aspects of the program. We believe it's time for a true Federal-State-Local Program. Local elected officials must have a stronger role in establishing transportation funding priorities and in selecting projects which meet both national and local goals. Local officials have been involved in such decisions under the Federal Transit Program, and that process has worked very well. This has not been the case with the Federal Aid Highway Program where many states have been resistant to including local governments in highway decisions.

While the interstate system is about to be completed, urban congestion problems worsen, and rural areas see little if any improvement in the conditions of their roads and bridges. To remedy this situation, new legislation must include local government elected officials as equal partners in the Federal Aid Highway Program. A mandatory and statutory process must be created to ensure that local elected officials are consulted and also that their views are fully considered in planning, funding allocation and project selection decisions. We would be happy to work with the Subcommittee in determining how this can take place.

We know this will require a somewhat different perspective by Federal and state highway officials, but it seems almost unthinkable to try to address our future national transportation priorities without requiring local input.

Now let me talk about the surface transportation programs we believe should exist in the post-interstate era. We propose basically four highway programs in addition to the transit program. The highway programs would be Urban-Suburban Mobility, Rural Access, a Bridge program, and a unified 4R Primary Program. The Urban-Suburban Mobility Program would be created to replace the FAUS Program and would contain more dollars than the FAUS currently contains. These funds would be passed through directly to areas in excess of 200,000 population and at the option of local officials, could be used for mass transit projects. Counties are in an excellent position to understand and undertake surface transportation projects aimed at addressing the mobility needs of the residents. Larger counties have both the planning and engineering expertise to carry out these projects without direct state involvement.

Salt Lake County, my county, faces serious congestion problems. The $2.9 million we received from the Federal Aid Urban Program just doesn't go very far in addressing our more than $1.1 billion worth of transportation needs that confront our county in the next five years. In addition, as a major urban county in a rural state, our staff is more than qualified to be able to handle the use of additional Federal dollars. In fact, I would submit that our people are more qualified than the state in understanding and meeting our needs from a technical point of view.

The second program, as I mentioned, is rural access. The Rural Access Program would be created to replace the Federal Aid Secondary Road Program, but again, funded at a higher level to meet increased needs. This would provide access to interstate and primary roads and these are key factors in the revitalization of America's rural areas and also to the agricultural, logging and mining and tourism industries. However, for the last 30 years our secondary highways have received the least attention from the Federal

Government of any system, and their condition reflects this lack of attention. Roads designed to meet post-World War II standards are carrying vehicles with gross weights in excess of 100,000 pounds. In addition, railroad abandonment has moved goods off the railroads and into trucks.

This program would continue to be administered by the states with guarantees of strong local government input in the allocation, planning and selection process, or rural areas, rural counties could join together by agreement to receive the funds directly from the Federal Government.

The condition of bridges in general and of the county bridges in particular should be a national concern. And this Committee knows the statistics already. With 165,000 county bridges in substandard condition, NACO is very concerned about the problem and we recommend that a bridge program remain a separate program. The rehabilitation of the Nation's bridges is too high a priority item to be folded into a block grant or so-called flexible program. Again, these programs should also be funded at a higher level.

The fourth highway program would be the Unified 4R Primary Program which would maintain and upgrade interstate and primary systems. We recognize the investment this Nation and our states have made in these programs and in these systems, and we want to protect that investment. But we believe an emphasis should be given to projects that would relieve congestion in urban and suburban areas.

Again, the mass transit program would retain a separate identity but provide more flexibility to recipients in how they would spend their transit money. We should not force the use of transit money on capital projects where they're not needed, but allow the flexibility to use these monies on operating expenses such as maintenance where it's more appropriate in certain areas.

NACO also believes that most if not all of the transit programs ought to be funded with a dedicated source of revenue consistent with the President's proposed transportation policy.

Now, financing, of course, is a key issue. NACO supports the following guidelines and principles: First, the Federal surface transportation program should be user-fee based to the extent possible. Second, all levels of government should increase funding for surface transportation programs. And, third, there's a substantial balance in the highway and mass transit trust funds that must be addressed during the reauthorization legislation. The balance of almost $18 billion should be spent down and in the future all trust fund revenues and accrued interest should be allocated in a manner that reflects the spirit and intent that accompanied the establishment of the trust funds in the first place.

As far as funding levels for each of the highway programs, NACO believes it has come up with a very fair and equitable approach. In the new programs we recommend that the baseline established by current programs be retained for each of the new programs with the exception of the Federal Interstate Construction Program which will be eliminated. The Bridge Program would continue to be at least $1.6 billion; the Urban-Suburban Mobility Program at least the current $750 million; the Rural Access Program

at least the current $650 million; and the interstate 4R primary program $5.1 billion which is the current level.

The $3 billion currently being used for the Interstate Construction Program should be reallocated with not less than 50 percent going to the new Urban-Suburban Mobility Program, the Rural Access Program, and the Bridge Program. The remaining funds would go to the Interstate 4R Primary Program. This would ensure that adequate funds are maintained to protect the interstate and primary investment but would meet the greater demand and greater needs that exist in the congestion in urban-suburban areas and also providing rural access. Any new funds that can become available such as through new gas tax authority would be allocated one-third to the Interstate 4R Primary Program and two-thirds to the Urban-Suburban Mobility, Rural Access, and Bridge Programs. We believe that's a very equitable formula that protects our existing investment and also meets future needs.

Transit should continue to receive one cent from the gasoline tax and to meet the President's goal of getting that out of the general fund into a user fee supported area should receive additional gas tax money from future allocations.

Finally, the area of finance. Counties already fund more than 50 percent of their highway budget from non-user fee sources such as property taxes, sales taxes, and other local taxes. And counties fund over two-thirds of their highway programs from their own revenues in general. Only local governments have made such a general fund commitment. Local governments already match every Federal dollar with three local tax dollars. Meanwhile, the Federal Government doesn't even spend all of its highway money on highways.

It must also be recognized that the financial resources of many county governments are limited by both the absence of a tax base and state imposed limits on their ability to raise and/or impose additional taxes. During the last 10 years the Federal share has gone down in the overall highway program. The state share remain constant. The local share has already increased.

I'd just like to comment that we continue to believe there is an appropriate Federal role in highway safety and also research and development in technology transfer.

Mr. Chairman, that concludes my testimony. I'd be willing to answer any questions that you may have.

Mr. MINETA. Thank you very much, Mr. Barker. NACO urges the Subcommittee to provide a stronger role for local officials in establishing funding priorities and selecting projects. I'm wondering if you could explain to the Committee how the existing Federal provisions have limited the involvement of local officials in establishing funding priorities and selecting projects.

Mr. BARKER. In most areas the decisions are made by the states and controlled by the states. It works well in some states where there is local involvement and local participation in that decision-making. But in other states there is virtually no local role at all. The reason is because there's no Federal mandate that there be a local role. In Federal aid urban money, that money is to be spent in areas with over 200,000 population, but not necessarily by local

governments or even with the involvement of local governments in deciding which projects are most important.

We believe that the legislation should mandate local involvement and local participation in the decisionmaking process to ensure that in all states there is a local role.

Mr. MINETA. Under the proposed new partnership for the Federal, state and local governments that's called for in the Secretary's National Transportation Policy, the Federal role for local transportation programs would be reduced. Should there be a continuing and higher Federal funding support for the rehabilitation and replacement of bridges that are not a part of the Federal-Aid Highway System?

Mr. BARKER. We believe there should. The reason for this is that the ability of a transportation system to carry goods and services and people is often restricted by the quality of the bridges that exist. The current Bridge Program is very effective in rehabilitating the bridges that need to be rehabilitated, but it's gone just a little ways in meeting that need. We have a great backlog of substandard bridges, many of which are interfering with the ability to reach the Federal-Aid System. In rural areas, access to the primary and interstate systems reduces our competitiveness in getting agricultural, mining and other products to market. In urban and suburban areas substandard bridges often cause a loss in productivity as people and goods are moved less efficiently and billions of dollars are wasted. So we think it's very critical for our international competitiveness that this be part of the program. And we think that the Federal role should not decrease in local systems, but should increase. We feel very strongly that the Federal role the last 30 years to meet the interstate needs has been very, very appropriate. But now the greatest need that faces our country in transportation is in the relief of congestion and the provision of rural access.

Mr. MINETA. Now the Committee has received testimony that would support a revision of the existing formulas for apportioning Federal-Aid Highway Funds to reflect more accurately the needs of the system. Does NACO support any changes in the formulas for apportioning Federal-Aid Highway Funds?

Mr. BARKER. Among the states? We have not taken a position on that issue to this point. We have spent most of our energy in discussion considering the need for a greater Federal commitment to relieving congestion and providing better rural access throughout the country and have not addressed the funding formulas.

Mr. MINETA. The—in terms of this reallocation of existing Federal-Aid Highway Funds, what kind of factors did NACO consider?

BARKER. It was an area of great discussion and debate within our organization. There are many members of our committee who believe that the entire $3 billion that is currently going toward interstate construction should be allocated to relieve congestion in local areas and provide better rural access. But the final decision was that it is important to continue the Federal commitment to maintaining and rehabilitating the interstate and primary systems. That's why we recommended that the $3 billion be split between local systems and the primary systems. Yet, we believe two-thirds of the future money should go to local systems.

Mr. MINETA. Going back to your first question about a stronger role for local officials, I assume you have some kind of a cog there in Salt Lake County.

Mr. BARKER. Yes, we do.

Mr. MINETA. To what role, or to what extent does the COG serve as in terms of any metropolitan planning organization for transportation purposes to give the local government, let's say, the leverage to deal with the state people?

Mr. BARKER. In our case it works fairly well. We have an agreement with our state, a written agreement, whereby that money is allocated jointly and we think that's a good model for many other areas of the country. In rural areas that varies from state to state; some rural areas have regional organizations and associations of government, others do not. And we would not recommend that regional involvement be required in rural areas but be optional in rural areas. In urban areas it seems to work very well and it tends to be the standard that is used throughout the nation where the local governments do have a role. In many areas there is no role; states make the decisions, and that needs to be corrected.

Mr. MINETA. Very well. Mr. Barker, thank you very much for your testimony here on behalf of NACO.

Mr. BARKER. Thank you.

[Mr. Barker's prepared statement appears on page 1693.]

Mr. MINETA. I would now like to call on David Soileau, Federal Programs Analyst, Texas State Department of Highways and Public Transportation; and Franklin White, Commissioner from the New York State Department of Transportation.

Mr. Soileau, we have your statement, so that will be made a part of the record. So, if you would go ahead and proceed in your own fashion, sir.

TESTIMONY OF DAVID SOILEAU, FEDERAL PROGRAMS ANALYST, TEXAS STATE DEPARTMENT OF HIGHWAYS AND PUBLIC TRANSPORTATION

Mr. SOILEAU. All right, Mr. Chairman. Thank you very much. First, I'd like to thank you, Mr. Chairman and members of the Committee for allowing us to be here today. Our Engineer Director, the head of the Highway Department, Mr. Arnold Oliver, was unable to be here as were the members of our Commission. I'm happy to be here in their stead.

My name is David Soileau. I'm Federal Programs Analyst for the State Department of Highways and Public Transportation. We're responsible for the 77,000-mile state highway system in Texas as well as for the State and Community Highway Safety or Section 402 Grant Program and the state-administered portions of the federal assistance program for public transportation. We also have responsibilities for the Gulf Intercoastal Waterways in Texas.

As my written statement indicates, Texas has undergone considerable growth over the last several years. We're now at about 16 million people; we expect to reach 20 million during the next decade. We've become an urban state, whereas, up until about 1940 we were mostly a rural state. About 80 percent of our people lived in rural areas. We're now about five percent more urbanized than

the national average. That is, we've got about 80 percent of our people living in our cities or in our urban areas around those cities. We operate the largest highway system in the country, about 305,000 miles of highways. We have about 14 million registered vehicles—almost one vehicle for every Texan. Our highways carry about 150 billion vehicle miles of traffic annually.

We have as many miles of farm-to-market roads—about 43,000 miles—as there are miles of interstate highways. We have more bridges—about 46,500—than any other state in the country. Because of our tremendous growth in the seventies and eighties and our increasing urbanization, particularly in the Rio Grande Valley, we have evidence there about why we've got to continue to provide Federal assistance to surface transportation and why that assistance has got to reach beyond today's interstate highways. It also points up why Texans must receive a fairer return on their Federal highway user dollar.

We agree with the American Association of State Highway and Transportation officials that the first Federal priority should be to preserve the highway system we now have. To replace the 77,000-mile state maintained network in Texas would take more than $100 billion, and we simply can't afford to start from scratch there.

To better enable Texas to meet the challenges facing us, we believe that the new Federal-Aid Surface Transportation Assistance Act must do three things:

First, it must restructure the Federal-state partnership and the current Federal Aid Program.

Second, it's got to revise the formulas through which Federal funds are distributed to the states.

And, thirdly, it's got to increase the level of Federal transportation funding, and to do that, at least initially, by protecting the Federal transportation user fee concept.

We believe we must have a simpler and more flexible Federal program structure. The underlying responsibility of the Federal Government for national defense, interstate and international commerce and the safety and mobility of our people must shape the Federal role in transportation. We also believe that the Federal involvement should support and should not inhibit the unique creativity and expertise that marks each of our states. Federal red tape should not keep our roads and our bridges from being upgraded. We have in Texas $5 billion in bridge work alone waiting to be done. We would like you to let us get on with it quickly.

We agree we must look at transportation more comprehensively. Highway planning must coordinate with rail and air systems so that travelers and freight can more efficiently move between transportation modes.

We join with AASHTO in recommending a two-part program structure. A categorical or focused program and a flexible program for both highways and public transportation. This two-part structure would continue to address national needs, but would allow the states the flexibility to determine and address their local needs.

We support the proposal of AASHTO for the designation of a highway system of national significance that would connect our major cities, our seaports, our border crossings, our recreational areas and our defense facilities. That system would also extend our

principal national highway network to our new population and economic centers. This is particularly important to Texas.

The highway segments which make up that national network should also be designated according to uniform national criteria and should be required to meet uniform design and construction standards.

But particularly in Texas the national interest in transportation exists beyond this national highway network. We also support AASHTO's proposal for a flexible highway program providing support to the states to bring consistent safety and quality standards on those highway systems supporting the principal national network and to provide smooth connections between the different transportation modes.

Our highly competent state highway agencies should be given the flexibility to determine the best uses of limited resources to preserve and expand our transportation infrastructure.

Last week you heard from other agencies concerning the Clean Air legislation that's before you, and we have special concerns there and ways in which the bills you're now looking at would limit state flexibility. You heard from AASHTO and the National Association of Regional Councils, and we believe that they offered some information that we urge you to consider. Beyond that, we can only ask you to remember that our national policies concerning Clean Air and transportation should be mutually reinforcing and should seek to meet clean air and energy goals in ways that are consistent with transportation's primary contribution to mobility and economic competitiveness.

We agree with AASHTO that the Federal Transportation Fund should be divided equally between the System of National Significance Program and the Flexible Highway Program. Because the Flexible Highway Program pursues objectives that are predominantly related to state and local transportation systems, we think the transfer of funds between states for that program is inappropriate. We believe that each state should simply be allocated a pro rata share of its total Flexible Highway Program funds based upon its share of total Federal highway user contributions to the Federal Highway Trust Fund.

With regard to the System of National Significance categorical program, however, we believe that funding should be driven by factors that correlate well with the national interest to drive that program.

We support AASHTO's recommendations that the formula for the state-by-state distribution of SONS Program funds use the following factors: total statewide urban and rural lane miles and total statewide urban and rural vehicle miles traveled. However, we go further than AASHTO. With the other members of the Crescent Coalition, from whom you have also heard, we believe that the funding formula for the SONS Program should reflect the network's contribution to interstate commerce. We believe that is best reflected by the intensity of heavy truck traffic and we believe that the best measure of that is diesel fuel consumption. We support the Crescent Coalition's distribution formula based on those three factors. We also believe it's critical that the factors in the SONS funding formula be decoupled from the specific roadway segment in-

cluded in the SONS so that states have no incentive to include highways in that system.

We agree with AASHTO that the level of Federal investment in highways and public transportation must be increased. Almost 80 percent of Texans oppose any reduction in highway expenditures.

We receive in Texas almost a billion dollars a year in Federal highway funding. But that's only 80 percent of the Federal user fee payments that we make to the Highway Trust Fund, and it only covers about a third of our Department's budget. Our total funding from all sources, state and Federal, will cover only about 60 percent of our identified highway needs on the state-maintained system.

We do not, however, believe that an increase in Federal highway user fees is necessary at this time to increase the Federal investment. With AASHTO, we believe there should be no increase in Federal highway user fees until four conditions are satisfied:

First, that the dedication of current and future Federal highway user fees to transportation purposes must be reaffirmed. We believe that you must keep trust in the Highway Trust Fund. More than 70 percent of Texans oppose using highway funds for non-highway purposes. In fact, a record number of our voters agreed to amend the State Constitution to dedicate Federal highway reimbursements to highway use.

Secondly, we believe that you should make the full balance of the Highway Trust Fund available to the states for obligation within the legal limits on that from the Byrd Amendment.

Thirdly, we believe you should repeal the exemption of ethanol blended gasohol and other alternative fuels from the Federal excise tax on motor fuels. This free ride for certain highway users has cost the Highway Trust Fund more than $3 billion since 1979. The Clean Air bills you're now considering would only increase that diversion by mandating an increase of ethanol blended gasohol to approximately 25 percent from the present about eight percent.

And, finally, we believe you should improve the effectiveness of Federal motor fuel tax collections.

Thank you, Mr. Chairman, members of the Committee. We appreciate the opportunity to testify before you today and will be happy to answer any questions that you have.

Mr. MINETA. Thank you very much, Mr. Soileau. At this time I'd like to call on my very fine colleague from New York, Mr. Nowak, a person with whom I came to the Congress and who's now our distinguished Chairman of the Water Resources Subcommittee. Mr. Nowak, I believe you had some comments at this time.

Mr. NOWAK. Thank you very much. We have—I understand Commissioner White hasn't had the opportunity to testify yet, and I've had Water Resource hearings this morning which prevented me from attending the full hearings of this Subcommittee. And I know that Commissioner White also would like to attend the Delegation Luncheon that everybody's looking forward to his presence at. We have missed that schedule by several minutes already, but I know how important this testimony will be for our Committee, and we look at the record of Commissioner White in New York. Everybody welcomed his arrival in New York State, and since then he's confirmed all the highest hopes of most of the transit people in New

York and certainly has had a terrific kind of state to administer because of the variance of factors which he has to consider in putting together a complete highway and transit program. We look forward to his testimony here today and working with him in the future.

Mr. MINETA. Mr. White, your testimony will be made a part of the record. And if you would go ahead and proceed in your own fashion, sir.

TESTIMONY OF FRANKLIN WHITE, COMMISSIONER, NEW YORK STATE DEPARTMENT OF TRANSPORTATION

Mr. WHITE. Thank you, Mr. Chairman. Thank you, Congressman Nowak. I'm sure you know that we feel without the support that you have provided to us over the years, we would not be in the shape that we like to think we are. So thank you very much for those kind remarks.

I want to thank the Committee for giving New York an opportunity to present our views on the reauthorization of the Federal Surface Transportation Programs. I'm here today to highlight the issues of particular concern and importance to New York State. The imminent completion of the interstate highway system and the issuance of Secretary Skinner's National Transportation Policy Report make this an opportune time to review and restructure the Federal Transportation Programs to meet the Nation's changing surface transportation needs.

Let me begin by commenting on the National Transportation Policy issued by Secretary Skinner last month. We in the transportation field have great admiration for Secretary Skinner's willingness to undertake a task this large in so difficult a political and budgetary environment. Irrespective of the outcome and whatever your view of the outcome, the Secretary clearly deserves credit for engaging the debate. Having said that, those of us who work with the Federal Transportation Programs also had high expectations for the policy statement. We're told that the new partnership will lead to a healthier partnership between the Federal Government on the one hand and the state and local governments on the other. Our question is healthier for whom?

If we want to understand the National Transportation Policy, it's necessary to look at the Administration's proposed budget. Under that budget, New York State would stand to lose nearly $200 million in Federal transportation aid, $15 million in highway assistance, and $185 million in transit assistance. We always thought that bleeding a patient to restore him to health went out of medical fashion a hundred years ago. In a healthy partnership everyone shares the benefits and the pain.

In the partnership proposed by the Administration one partner's health is improved by bleeding the other to the point of anemia. Although all of the states need additional transportation resources, in working with the other states through AASHTO, we believed it was irresponsible simply to ask for more money without considering the impact on the Federal budget deficit. So it was decided to take a very responsible middle ground. In a broad consensus with the other states, we believe that Federal highway and transit as-

sistance should increase, but it should increase gradually over a four to five-year period. We view the next Surface Transportation Act as a transition from present programs and funding levels to the new programs and financing which will be needed in the 21st century.

The preferred method of providing the increased Federal funds would be by spending down the balances in the highway and mass transit accounts of the Highway Trust Fund to the extent that the Byrd Amendment allows. However, the National Transportation Policy, as you know, does not promise to do so. This most reasonable approach was rejected for obvious reasons. We do not have to spend a lot of time talking about the Trust Fund balances. The situation with them is analogous to the situation with the Social Security Trust Fund balances that Senator Moynihan has been talking about.

To move on to another area, let me point out that in the important area of public transportation nothing is more important to the New York metropolitan area and many other large urban areas nationwide than an efficient transit system. We estimate travel will increase 50 percent in the New York Metropolitan region between 1990 and the year 2015. It is simply not possible for the existing transportation system in the region to absorb this increase in trips. If we do not plan now to accommodate this travel demand, the growth in travel will paralyze the region. The only way we can hope to cope with expected future travel in our densely developed urban areas is by getting people to use mass transit in place of automobiles. The time has come, we believe, for the great American love affair with the automobile to get a friendly divorce. We need to make transit the preferred transportation alternative in large metropolitan regions.

Our state has one-third of all public transportation users in the United States and accounts for about one-quarter of all transit miles. New York's use of public transportation we believe measurably lowers the national level of gasoline usage and vehicle emissions. To help get people out of their cars and to treat transit equally with highways, we must change the present law which allows unlimited automobile parking costs to be treated as business expenses and, therefore, tax deductible but only allows a maximum of $15 per month to be deducted for employer-provided transit expenses. We need to raise the transit incentive immediately to at least $60 a month as is proposed in H.R. 494 by Congressman Rangel, so that we can establish equity between the way the tax laws treat travel by automobile and travel by public transportation.

Formulas to allocate Federal transit assistance should reflect the varying needs of public transportation in our Nation's urban and rural areas. The current formulas for allocating transit assistance which represent a balance of existing services and population factors should be retained.

With respect to bridges, let me note that although a significant number of bridges have been improved in recent years under the Federal Bridge Replacement and Rehabilitation Program and the regular Federal Aid Programs, the Nation's bridge improvement needs remain extensive. And let me also present our credentials in

this area. Anyone who has anything to do with New York City bridges is an instant expert on the subject. I sometimes think that if Peter Minuet had been a transportation planner when the Indians offered him Manhattan Island for $24 in trade goods, he would have turned it down. A planner who could look far enough ahead would have said that the real estate would need too many bridges to be worth the cost of operation and upkeep. In that case, had he turned it down, the World Trade Center would be in Newark and the Empire State Building would be the Garden State Building.

Despite the obligation of over $16 billion in Federal aid since 1982 for replacement and rehabilitation of bridges, we were barely able to keep up with the rate of deterioration from 1982 to June 1988. While there was a slight reduction in the total number of deficient and obsolete bridges during the period, the proportion of interstate bridges classified as deficient rose from 10.6 percent to 15.9 percent by June of 1988. Clearly, the present Federal program funded at $1.6 billion annually is not keeping up with the rate of decay of our Nation's most important bridges.

In New York we have programmed the rehabilitation or replacement of almost 1,800 bridges at a cost of over $4.5 billion over the next five years. The Federal Highway Administration estimates that nationally an investment of $4.9 billion in '87 dollars is needed just to maintain the present overall conditions. If inflation is considered, the annual cost will be $6.3 billion by 1992.

The present Discretionary Bridge Program funded at $225 million annually is clearly not enough to take care of the large bridges. The new legislation we believe should set aside at least $350 million annually for a Discretionary Bridge Replacement and Rehabilitation Program which would ultimately grow to $500 million. The rehabilitation or replacement of any deficient public highway bridges costing more than $20 million or 20 percent of any state's annual apportionments, whichever is less, should be eligible for funding under the Discretionary Bridge Program that we propose.

In his National Transportation Policy Secretary Skinner calls for greater flexibility in the use of transportation funds so that the most cost effective solutions can be implemented. He also cites the importance of maintaining our transportation infrastructure. We strongly support both objectives. States should have the flexibility to use Federal funds for preventive maintenance activities where these activities preserve our bridges and pavements and help prevent later more costly major reconstruction.

We firmly believe that a timely expenditure of a small amount of Federal funds for preventive maintenance will be returned many times in the resultant increased life of the facilities and reduced reconstruction cost. Yet, under the present guidelines, if we maintain our facilities adequately, we—the state and local governments—have to do it with our own money. If we let them fall into disrepair so that they require major rehabilitation, the Federal Government helps to pay for that rehabilitation. One wonders whatever happened to the old notion that an ounce of prevention is worth a pound of cure. I do not think it's an exaggeration to observe that much of the Nation's infrastructure dilemma can be traced to this longstanding policy which encourages reconstruction

over preventive maintenance and we believe Secretary Skinner did not go far enough in that he failed to propose that there ought to be Federal reimbursement for preventive maintenance activities.

On another subject, the Interstate Trade-in Program was enacted by Congress to allow states and localities to substitute an alternative highway or public transportation facility instead of building a non-essential Interstate highway. That program is nearing completion. By the end of 1991 only five or six states will be owed major amounts of money. The program will require about one additional year of funding at the present annual apportionment level of about $750 million.

We also believe these funds, as well as previously provided funds, should be available until expended. This is a vital program for many major metropolitan areas and should not be allowed to choke on bureaucratic regulations or penny-wise pound foolish budgetary constraints.

Finally, a word on highway safety, a subject of great concern to all of us. Statistics show that the 55-mile-an-hour speed limit reduces accidents and we in New York State are committed to maintaining that limit on our highways. We also support the National Speed Monitoring Program to gauge compliance with the 55-mile-an-hour limit. We do feel, however, that the current sanctions imposed on states not complying with the 55-mile-an-hour limit are not only inequitable, but in many cases, counterproductive. We should be monitoring safety, not compliance with speed limits. States with good safety records should not be sanctioned. We also believe that compliance must be monitored on those highways which are posted for speeds greater than 55 miles an hour as you know there's now no requirement to monitor those speed limits, and from this much inequity arises.

In New York State we have discovered that the 55-mile-an-hour speed limit, mandatory seat belt use, tough crackdowns on drunk drivers and mandatory helmet use for motorcyclists have all contributed to reducing fatal and less serious accidents. While we do not claim to be perfect, we think we are making good progress and commend similar programs to others.

There are many other issues which need to be discussed as part of the reauthorization of the Surface Transportation Program, but the ones which the Committee and its distinguished Chairman have permitted us to raise today are the major issues of concern to New York State.

In conclusion, I would like again to thank the Committee for the opportunity to appear. Thank you.

Mr. MINETA. Thank you very much, Mr. White. I'd like to at this time call on our very fine colleague from Texas, Mr. Laughlin.

Mr. LAUGHLIN. Thank you, Mr. Chairman. David, I apologize for being what I understand about 30 seconds late. Between a meeting and catching every floor between the sub-basement and this floor, I managed to be a little late.

Mr. Chairman, I consider it an honor to welcome David Soileau here, but I think you heard from his testimony the importance of this bill to my state and we Texans have been accurately accused of bragging too much, but the facts are there that our highways are—more miles of highways are more numerous than any other

states. And I point that out along with the fact that we have more bridges, not for the bragging purposes, but to get back to the highway transportation fund situation. We recognized what was coming. And, David, correct me if I'm wrong—on that Constitutional Amendment you referred to, we have—and again, this sounds bragging—but we have a Constitution that's been amended more than any other Constitution in the United States. But that Constitutional Amendment restricting the use of Federal Highway Funds passed by a larger percentage or number of votes, looking at it either way, than any of the several hundred Constitutional Amendments we have in our State Constitution; isn't that correct?

Mr. SOILEAU. That's my understanding. I've only been in Texas 10 years.

Mr. LAUGHLIN. Well, I've been there all 48, and we have several hundred Constitutional Amendments versus the few that the Federal Constitution has, and none ever passed by that very substantial margin. Mr. Chairman, I think that highlights the concern that Texans as well as people all over this country have about the freeze on the Trust Fund that we're battling. I know that David's got a short schedule, but I do thank you for your appearance and your very important contributing testimony.

Mr. SOILEAU. Thank you, Mr. Laughlin.

Mr. MINETA. Mr. Soileau, let me ask, one aspect of the Administration's National Transportation Policy is to encourage Federal transportation assistance to leverage greater participation by state governments in providing mass transit assistance. I'm wondering how you would assess this proposal.

Mr. SOILEAU. In Texas in terms of mass transit assistance, one of the things that we've done is provided local governments with the option to add a sales tax—I think up to a penny in sales tax—to fund mass transit. That's one of the ways in which we've already increased our local participation in funding mass transit. I think that the Federal assistance is important to that, and we think that certainly there is a need for—in an urban state as Texas is, as strange as that sounds—I think there is a need for mass transit, for increasing support for public transportation, both in our urban and rural areas. And I think that the Skinner policy is correct in trying to leverage that up. But I think there is something that local governments can do there in the ways that we've suggested.

Mr. MINETA. Now you've indicated in your testimony that Federal red tape interferes with the upgrading of roads and bridges. I'm wondering if you could explain to the Committee how existing Federal regulations have limited this upgrading and why you think that's the case.

Mr. SOILEAU. One of the things that has been made clearest to me about that has to do with those highway bridges that are off the state-maintained system, where, if Federal dollars that are available to upgrade bridges are made available for those bridges, the result is that you end up with a bridge that is built to standards far exceeding the necessity of the particular location, and at a cost far beyond the county's ability to come up with the Federal matching funds. That's the most specific example that I think we've had. We believe that those bridges need to be upgraded, but perhaps not to the level that current Federal standards require

them to be built. That way we think the upgrading would be more within the reach of the local governments that are primarily responsible for those bridges.

Mr. MINETA. I understand you have to get away early, so let me go ahead and ask Congressman Nowak to go ahead and question you first before we get to Mr. White.

Mr. NOWAK. Well, thank you very much. I really don't have any specific questions. I wanted to ask Mr. White a couple of questions if I could.

Mr. MINETA. All right. Let me go to Mr. Laughlin then first.

Mr. LAUGHLIN. I have no questions. David and I visit frequently, and thank you very much, Mr. Chairman.

Mr. MINETA. You have nothing to provide for the furtherance of our education, Mr. Laughlin?

Mr. LAUGHLIN. I will.

Mr. MINETA. Everything gets done in such a big fashion there in Texas.

Mr. LAUGHLIN. At a later time, Mr. Chairman.

Mr. MINETA. Well, again, I don't want to hold you up, Mr. Soileau, because I understand you had some other commitment.

Mr. SOILEAU. I'll stay until the end of the panel.

Mr. MINETA. Oh, you can stay. All right. Well, then let me ask of Mr. White, Mr. Commissioner, in your testimony you indicate that formulas used to apportion Federal-Aid Highway Funds should be based on accurate easily collected and verifiable statistics. However, as you may know, whenever formulas are modified, there are always winners and losers. Should any new formula for apportioning Federal-Aid Highway Funds provide for a hold harmless amount or minimum guaranteed amounts to those states that may receive reductions in their apportionments under a revised formula?

Mr. WHITE. Mr. Chairman, it's difficult to answer that question without knowing the amounts of money that would be consumed in providing the hold harmless or the grandfathered amounts. But I would say in general, yes, that's the way the program changes are ordinarily done. What I would say on the other hand is we're not at all sure that there is any need for radical changes in the present formulas. We think the transit formulas take account of the right factors. We think by and large the highway formulas are appropriate, and so we're not clear at all that there needs to be any substantial revision of those formulas.

Mr. MINETA. Now, with the completion of the interstate system, the Congress will focus on the preservation of the Federal-Aid Highway System. Would the use of Federal funds for preventive maintenance activities result in a cost-effective use of Federal funds or would such a use of Federal funds only substitute for local maintenance funding?

Mr. WHITE. I think, Mr. Chairman, this is the most important policy issue that I believe is present in this debate, and I wish I could say I'm optimistic that it would come out the right way. I don't think it will because I think administratively there are all kinds of fears within the Federal Highway Administration about how you manage a program if it extends to preventive maintenance. What is the definition of preventive maintenance? How do

you monitor the cost? As someone running a program, I can envision all of the problems that they would foresee in managing a program that covers preventive maintenance. But I do strongly believe that the 50 states have often inappropriately spent money because of the availability of Federal money for rehabilitation and reconstruction when in point of fact, had we spent the money at the front end, we would have reduced the expenditures both of local funds and of Federal funds. I can tell you at the local level it's very attractive to say I need these dollars to match Federal dollars. I believe many states, including to some extent our state, fell into the trap of wanting to match Federal money and spending it on the purposes for which Federal money was available. And I do believe that it is sensible now for the Federal Government to ask whether in retrospect this may not have been the wrong approach; an approach that was more expensive than had we taken on the bureaucratic bear of how to manage preventive maintenance.

And I must say, in my judgment, the Federal money was provided without adequate insistence that in order to be eligible for the Federal rehabilitation money, one had to demonstrate that all of the preventive maintenance was done. I feel like a crier in the woods on this issue. It didn't work as we debated this issue in AASHTO, but I do feel that over the last 20 or 30 years perhaps we made a mistake in the way we structured this program.

Mr. MINETA. When you say that we didn't spend enough up front on the front end, when you're trying to come up with cost figures, you do life cycle costing of a specific project, do you not?

Mr. WHITE. That is the way the 50 states are moving with respect to pavement management systems and bridge management systems. That's the way we're now moving. In fact, there's a federal requirement that there be a pavement management system which includes life cycle cost by 1992. We now have such a system, but my basic point is if you were to take a matter as simple as the painting of bridges, you cannot get Federal reimbursement with respect to the painting or any Federal participation in the painting of bridges. Yet, when that bridge has corroded to the point where it has to be replaced, you'll get millions to help you rebuild it. I say that is insane. But it is a matter I do believe ought to be considered as difficult to implement though it be.

Mr. MINETA. So how do we turn the screws on that so to speak to make sure that states are doing a maintenance management program? In our conversation I was explaining the Williamsburg Bridge and the Golden Gate Bridge. The Golden Gate Bridge was under a regular maintenance program. Or even the Triborough Bridge Authority, how they're funded in terms of maintenance there. Or even—who is it—from the New York-New Jersey Port Authority talking about Holland Tunnel and their maintenance program versus some others.

Mr. WHITE. I think the answer is that if you're talking about an authority, something that has its own stream of revenue which it can adjust through tolls as it needs it, then you've got a different ball game. They can and will put the appropriate amounts of money, not only into preventive maintenance but into timely repair and rehabilitation. When you're talking about the funding of our infrastructure that comes from the general state funds, they

go up and down as the state financial difficulties go up and down. Consequently, what you find in very tight years is the state money that comes, comes to match the Federal money because you've got to have it to get the Federal money. This is true even from a state in which the Federal money that we receive is now a fraction of all of the money we spend. We have long been a state that overmatches multiples of what we're required to do. Nonetheless, there's all the reason in the world to think about whether we don't need to change the approach to our infrastructure management.

Mr. MINETA. Can you share with the Committee any recommendations that may be used to enhance overall highway safety under the National Speed Limit Monitoring Program?

Mr. WHITE. The thought we had there, Mr. Chairman, is simply that we wonder whether the 55 mile per hour maximum speed idea that came into being some years ago which has now been modified by the increase to 65 for rural interstates, has not really outlived its usefulness. As you know, the law is now very inequitable because there's no monitoring requirement for highways where speed limits have been raised to 65 miles an hour. Further, we think the focus ought to shift from speed to highway safety. We ought to be moving away from sanctioning states for non-compliance with enforcement of speed limits and to focus on the bottom line which is the safety record on the highways in each state. We don't have all the answers about how you ought to get there, but we think the new Act presents an opportunity to come up with a fresh approach which reflects highway safety rather than simply monitoring enforcement of speed limits.

Mr. MINETA. Was speed considered the fastest way to leverage by having a sanction against the states on withholding funds?

Mr. WHITE. I think that it is rightly perceived that speed is a very important factor of the overall safety condition. One point is that it's not the only factor.

Mr. MINETA. But suppose let's say under the Clean Air Act, under the fuel efficiency standards we keep raising those and then manufacturers keep producing smaller cars. The smaller cars may increase the accident rate, fatality rate. There's something you have no control of. You can lower your speed down to 45 miles an hour maybe, and your rate may still be going up and it would still be mitigating against you.

Mr. WHITE. Well, at the same time, though, while we have required more fuel efficient automobiles, we have also been trying to get them to be more safe in their construction. It's a difficult choice to make, but I——

Mr. MINETA. The reality, Mr. Commissioner, is that when the car gets smaller, the plate steel also gets thinner. Unfortunately, we could build a smaller car like an M-1 tank, maybe your point would be well taken. But unfortunately I think when they try to go from 2,900 pounds down to 2,400 pounds, it's not only the chrome that gets replaced by plastic but I think also that plate steel, sheet steel gets a little thinner.

Mr. WHITE. Well, my comment, Mr. Chairman, was not directed simply at the matter at how safe that vehicle would be. Even in a large car a seat belt, requiring helmets on motorcycle riders are all factors that play out in the ultimate safety of a highway, and we

are simply suggesting that speed is only one factor. Yes, it is true, as the vehicle gets smaller, it'll be less safe in an accident. But we ought to be looking at many more things because we are at a point I believe where we're not going to be able to enforce the sanctions which have been suspended for a number of years. The basic inequity has not been corrected, and so we're going to have to find another approach.

Mr. MINETA. Thank you. Mr. Nowak.

Mr. NOWAK. Thank you very much, Mr. Chairman. It's an interesting conversation that you engaged in concerning preventive maintenance. I'd just like to ask a question, as we look at preventive maintenance, in order to get some consistency throughout the Nation, has AASHTO taken a position or suggested a program which would make it eligible for Federal participation?

Mr. WHITE. I do not believe the AASHTO 20/20 report recommends as I do that consideration be given to including preventive maintenance activities as reimbursable in the Federal program. I do not believe they make that recommendation.

Mr. NOWAK. You know, I've seen some studies, some engineering studies; I've looked at bridges and analyzed those bridges over those long periods of time, and it's amazing the dollars that were saved by chipping and painting; the very same principle that the Navy uses to keep those ships alive out in the salt water. And, yet, we're not making eligible for the programs to on the other end of it to save an awful lot of heavy dollars on Federal reconstruction. It just doesn't seem to me to make sense, and I wondered if you were aware of any studies along those lines that could come before the Committee for their perusal.

Mr. WHITE. There are such studies, and we will submit them. It is accepted in this business as a truism that if you do the amount of annual upkeep that is required on the facility, whether it's a highway or a bridge, you will necessarily save over the long term. And I emphasize again that many transportation departments, as their states were strapped, had to use the money to match the Federal money which was coming and couldn't put it into preventive maintenance, nor was there a requirement at the Federal level that you demonstrate that all of the preventive maintenance required to be done on your system was indeed done before you're eligible to get the Federal funds. So, yes, we can submit the professional writings that have been done on the notion that timely preventive maintenance is cheaper.

Mr. NOWAK. The formulas and the studies that I've looked at, it's a dramatic difference, and I hope that you could provide or have your state associations provide that because I think it's a very worthwhile new initiative that we look at.

You mention the funding formulas and there is going to be discussion on that and, of course, on Secretary Skinner who was mentioned earlier talking about the new Federal role. And after he talked about the new Federal role, I guess it was about three or four weeks after that, he was someplace, and I just got a newspaper report as we're talking about the hold harmless provision, should we hold harmless. And I guess it makes a lot of sense to do that as long as you're dealing with an increased pot to hold harmless from. And whether we look at the initial spending down of the

Highway Trust Fund or whether we look at an opportunity for an increased—let's call it revenue at this time. Secretary Skinner made the statement, I believe, that a gas tax is not a tax in the traditional Bush read-my-lips survey that he puts out. And I don't think he referred to a revenue enhancement, but I guess he associated it with a user tax and that these were not the same. I'm wondering if all the states are looking at—I don't know 19 or 20 some states we have increases already over the last couple of years. The statistical information on spending, Mr. Chairman, that we discussed before shows a shift in actual amounts that each level of government invested in highways and mass transit. In 1980, the Federal Government's been 39 percent more for highway capital improvements than all the states and local governments. Yet, we turn the decade around, and by the end of the decade states and local governments are investing 36 percent more than the Federal Government. This huge shift seems to me to be part of the Reagan Federalism, but I wonder how long it can continue before we look at expanded revenue base here to further—now, we have to look at matching the state's initiatives and the local government's initiatives. I wonder if yourself and David could perhaps comment on that whole Skinner idea that now gas tax is a user fee.

Mr. WHITE. Congressman, let me just mention that in New York State relative to your comment about the last decade, I'm looking at a chart that shows transit expenditures in New York State. In 1980, the Federal share of transit expenditures was 78 percent and by 1989 it was 32 percent. That matches what has happened on the highway side as well. All of the states have had to triple the amount of local funds that they have had to have available for transit and highway needs over the last decade. We in New York had a billion and a quarter dollar transportation bond issue as you know in 1983, and a $3 billion highway and bridge bond issue in '88, and I don't even want to mention now what the next tier might be. At the present trend it will be enormous. So we were less than happy that the new policy really made no reference to either arresting that trend or turning it around to any degree, by drawing down the Trust Fund as I opened my comments with.

So we're less than happy with that policy.

Mr. NOWAK. Is Texas having the same general type of reversion, if you will, of investment? Tell us what Texas has had to do.

Mr. SOILEAU. As I mentioned in my remarks, the Federal dollars that we get amount to about one-third of our expenditures on highways. I mentioned also earlier that I've been in Texas for 10 years. In that time we have actually increased our user fee—our state fuel tax—200 percent. It's gone from a five-cent tax to a fifteen-cent tax, and so obviously that has happened. We're looking even at opening up some local option fuel tax as well there. I think we're in support of the user fee concept. I don't believe we're denying that that is a tax. But certainly we think that user fees are the way to go for transportation.

Mr. NOWAK. But it should be both on the state and the Federal levels.

Mr. SOILEAU. Yes.

Mr. NOWAK. Let me just say I'll be certainly working with the Chairman as we move forward with this legislation. And many of

the comments that you've made I think were well justified and certainly should be included in any revision. In addition to that, I hope Secretary Skinner comes forward with whether he wants to call it revenue sharing or whatever, an increase in those kinds of user fees which will give us the revenue in order to start to at least look at matching the new initiatives by the states. Thank you, Mr. Chairman.

Mr. MINETA. Thank you, Mr. Nowak. Mr. Soileau, let me ask, it's my understanding that among the innovative programs that are going on in Texas, one of them is called PASS—the Principal Arterial Street System. And the object of this project is to take a positive attitude toward traffic problems by attempting to meet travel demand rather than attempting to discourage use of the system. Through PASS how much traffic or congestion relief is this system expected to deliver over the long term, and is the PASS Program something that we might be able to use as a model to replicate with other state traffic relief programs?

Mr. SOILEAU. I'm not sure I can give you the detail on how much traffic it's expected to handle. I could get that information for you and provide it for you later.

Mr. MINETA. How long has that PASS Program now been in implementation?

Mr. SOILEAU. I think this is the second or third year of the program as I remember it. It's—the information I've gotten in responding to questions about the program has been that it's been quite successful and I think we do think it could serve as a model for handling congestion. I've heard it talked about as a way of encouraging cities to spend their money on increasing capacity rather than on roads that have less of an impact. And I think that's been successful in the areas where it's been applied. Everybody has chosen to go that route rather than seek to do other things.

Mr. MINETA. Commissioner White, let me ask you, with estimates that travel will increase 50 percent in the New York Metropolitan region between 1990 and 2015, can you provide the Committee with any recommendations for restructuring the current Federal-Aid Urban System Program to address that kind of expected travel growth?

Mr. WHITE. Yes, Mr. Chairman. I think the reality of that growth means one thing in the New York City Metropolitan area and in other large metropolitan areas, and that is we're going to have to seek to handle those additional trips through transit. Almost invariably, in all of our major cities the rights-of-way do not exist to rely on the highway system to meet this additional travel demand. We have to meet the travel demand through transit, and this is why we believe the entire structure of the transit program ought to be examined so as to encourage and make it possible for highly dense urban areas to meet the demands that they see through transit. I think that in the long run it will reduce the Federal participation in construction of new highways and rehabilitation of new highways, and so that is the answer as we see it.

Mr. MINETA. Very well. Mr. Soileau and Commissioner White, let me again thank you for your participation today. I know that this kind of dialogue will be continuing on over the next year and a half as we try to start—or within the next year as we try to formu-

late the program and try to get it passed before the September 30th date this next year because we don't want to have any break in the program. I intend to fully have some legislation in place by the time the present law expires, and so I'm going to be turning to you and your experience to get that done. Thank you very, very much.

[Mr. Soileau's prepared statement appears on page 1938.]

[Mr. White's prepared statement appears on page 1947.]

Mr. MINETA. At this time the subcommittee will recess for a half an hour and reconvene at 2:00 p.m.

[Whereupon, at 1:32 p.m., the subcommittee recessed, to reconvene at 2:00 p.m. the same day.]

AFTERNOON SESSION

Mr. MINETA. The committee will come to order. We have a large number of witnesses this afternoon, so at this time I would like to call forward a panel made up of Peter K. O'Rourke from the State of California, who is the Chair of the National Association of Governors Highway Safety Representatives; and also Maurice J. Hannigan, the Commissioner in charge of the California Highway Patrol. So if I could have Mr. O'Rourke and Mr. Hannigan come forward.

Mr. O'Rourke, we have your statement and that will be made a part of the record. If you would go ahead and proceed in your own fashion.

TESTIMONY OF PETER K. O'ROURKE, CHAIRMAN, NATIONAL ASSOCIATION OF GOVERNORS HIGHWAY SAFETY REPRESENTATIVES

Mr. O'ROURKE. Thank you very much. It is my pleasure to be here. Given the length of our testimony, I would just as soon highlight it.

It is true that over the last 20 years highway safety has improved greatly in this country, but it is still a major national problem. In 1988, over 47,000 people lost their lives on our highways and another 3.4 million were injured. Every 10 minutes, there is a traffic-related fatality; and every 10 seconds, a traffic-related injury.

Traffic collisions are the leading cause of death for those between the ages of 1 and 34; and it is only second to cancer in the societal cost to this country.

If we don't continue to make great strides, those fatalities are going to increase. There are those who project that by the end of the century, if the mileage to death rate does not decline, we will be experiencing over 60,000 fatalities annually, and by the year 2020, over 80,000 annually.

One of the reasons I believe that the improvement in fatality rates has occurred in this country is due to assistance of the federal grant programs. The most successful, I believe, is the 402 Program, which is the Community Highway Safety Grant Program. This program, in fact, has helped institutionalize traffic safety at State and local levels, and I am inclined to believe that if it hadn't

been for these programs, we would not have this devotion that we have seen in the 50 States and the territories to highway safety.

In implementing the 402 Program in California, for example, our role is to develop the California Highway Safety Plan. To do that, we take a look at what is occurring State-wide that is adversely impacting traffic safety for the State of California and its population. We do problem identification. We specifically solicit project activities that we would like to do in some cases because we feel that those programs would have a positive impact on improving traffic safety. In other instances, we just take blind proposals for highway safety projects as they come in.

While we can fund projects in 18 different highway safety areas, we target efforts at 7 areas. Not all States fund those 7 areas. For example, in California we do fund occupant restraint issues, impaired driving, traffic records, emergency medical services, police traffic services, and roadway safety projects, but we do not opt to fund motorcycle safety, because we have a self-sufficient motorcycle safety program. The 402-funded highway safety program in California has been instrumental in bringing Emergency Medical Services (EMS) to California. The 402-funded program paved the way for the EMS communications network; it established the first paramedic programs; it has been instrumental in the last few years in bringing down the incidents involving drinking drivers. The program has a very long-term, positive effect, we believe, in deterring young people away from alcohol and other drugs; it has been very instrumental, I believe, and I think Commissioner Hannigan will speak to it later—in improving seatbelt compliance we have in California.

In California we believe the 402-funded program may even have extended past our boundaries; for example, the state highway safety office worked with the entertainment industry to promote belt use. So it wasn't by accident that you saw television programs like Moonlighting and Cagney and Lacey and others dealing with occupant protection issues. This collaboration is still occurring even though we no longer give 402 money to the entertainment industry. The industry is now very carefully working with the issue of alcohol. In fact, within this last month, I found it interesting that on the same evening, one network had a half-hour comedy show that was devoted solely to the designated driver and, on another network, a show had an incident where one of their attorneys was arrested under California's new .08 provision. The show dealt with that whole issue very responsibly.

Now I can't say that the 402 money directly paid for those two shows, but it was instrumental in getting the networks, the television writers and movie writers, producers and directors to be thinking about those highway safety issues. So the program has been extremely beneficial in California; and, as I mentioned, I think its impact has extended beyond those boundaries.

One of the reasons the 402 program has been successful is that it is based on a seed money concept. We do not fund projects with 100 percent federal funds—we fund them 75 percent federal share in the first year, then 50 percent, and then 25 percent. The idea is that as the federal portion is withdrawn, the entity that you are funding has to fill in behind. When the federal funding is with-

drawn, that "seed" is in fact now an acorn growing into a mighty oak! All the audits that have been done have shown that for the most part, we have been extremely successful in encouraging local assumption of project costs. I think one of the other ways we have been successful in California—and I think in other States as well —is in enforcement programs. In California, we do not normally use 402 funds to pay for overtime enforcement. We will use the funds to support a position, or two or three positions, and then that entity, the city or the county, will ultimately budget for that position, so we are able to help them augment their enforcement staffs. That is the same type of approach that is done nationally.

Now, where do we think the 402 program should be going? We still believe that it is important in the years to come that the Federal Government, along with States and local government, work together in establishing priorities and goals; that the Federal Government should develop performance standards, provide technical assistance, conduct research, and develop national highway safety information and educational programs. The 402 Program should definitely be continued but should be restructured. We would like to see it basically become a two-tier system—a basic grant program as it is now, funded at approximately $125 million, and then an incentive tier, funded at the same level. The incentive tier would roll together the 408 and 410 programs but would also be broader based and would also include incentives for attacking the occupant restraint issues and other issues. The incentive program would address impaired driving, pedestrian safety, motorcycle safety, and speed. When I say speed, I do not mean speed isolated to just the 55-65 mph limit on the Interstate system. I do not think that is our problem; excessive speed on all roads is our problem. So we would like to see as I say a two-tier system to address speed as well as the other issues I've mentioned.

We believe the FHWA 402 program should be continued but funded at least at a minimum of $25 million. We are overwhelmed with proposals to spend that federal grant program money, and we cannot even begin to scratch the surface in answering FHWA 402 needs in the various States.

The MCSAP Program, the Motor Carrier Safety Program, should be continued and increased from its current $60 million level to $100 million annually. We believe the administration of that program should be shifted to NHTSA so that the commercial motor vehicle and non-commercial motor vehicle safety efforts can be addressed in a more comprehensive and coordinated way.

We also recommend that the program should be amended to allow MCSAP funds to be used for the enforcement of regular traffic safety laws as they relate to commercial vehicles. There has been research by the Congressional Research Services which indicates that there may be a weakness in the program. It is an issue that is being discussed at this point by both FHWA and NHTSA. If in fact, there is support for amending MCSAP, then we believe it should be expanded.

The Commercial Drivers' Licenses implementation grant should be continued but the funding for that also should be increased to be somewhere between $25 and $50 million.

A National Data Center should be established for the collection, analysis, and dissemination of uniform accident, injury, and fatality data. Over the long term, the Center could develop a unified database that includes all sorts of highway safety-related data such as licensing, registration data, traffic citation and conviction data, and data on highway characteristics. This Center we believe should be funded at $25 million a year.

Highway safety research should be continued and expanded to $75 million a year.

I can't stress the importance of having 402 program administration continue to be the responsibility of the Governor's Highway Safety Representatives. The GR's role has far exceeded merely passing through the 402 monies to highway safety projects. In many cases, we are instrumental in determining how other highway safety funds, for example, the Omnibus Drug money, is being utilized.

In my particular State, for example, over the last six years we have put $26 million into impaired driving. When we looked at that, we found that 62 percent of that money was going into prevention programs predominantly at the high school level. As the Omnibus Drug money started coming forward, we said wait a minute, if we are doing all these things, we had better make sure that we aren't duplicating some of the programs already being provided. As a result, California now has a Policy Council on Alcohol and Drug Abuse. The four agencies that administer the bulk of Federal monies in drug and alcohol programs are the Office of Criminal Justice Planning, the Department of Education, the Department of Justice, and the Governor's Highway Safety Office. We will not fund a request for prevention in the area of alcohol or other drugs unless an individual county has a master plan, and the city is part of that. That approach is being followed in a number of other States as well.

In order to provide increased funding for Federal safety grant programs and related activities, we recommend that the unobligated balance in the Highway Trust Fund should be drawn down and that the obligation ceiling on those programs should be raised. We strongly oppose any efforts to use the Trust Fund balance for nontransportation purposes.

Regarding speed compliance, as was stated earlier, we also agree that there should be monitoring and reporting on all 55 and 65 roadways and that data should be reported to DOT. We strongly feel that the compliance formula should apply to all States and should take into account the seriousness of the speed violation, the safety of the different types of roads, and the State's enforcement effort. As was stated by the gentleman from New York, we believe we should be looking at the entire safety record of the individual States and the compliance threshold should be set on a State-by-State basis. States should be given incentives for improving compliance instead of sanctions for failing to comply.

That concludes my remarks and I appreciate the opportunity to appear before the committee.

Mr. MINETA. Thank you very much. Commissioner Hannigan, we have your statement and it will be made a part of the record. If you would go ahead and proceed in your fashion, sir.

TESTIMONY OF MAURICE J. HANNIGAN, COMMISSIONER, CALIFORNIA HIGHWAY PATROL

Mr. HANNIGAN. Good afternoon Mr. Chairman and committee members. I am Maurice Hannigan, Commissioner of the California Highway Patrol, and I am here representing the State of California. I hope to offer you the perspective of at least one law enforcement agency that has primary responsibility, a major responsibility in the area of traffic safety.

My testimony will focus on the importance of traffic safety; principles to consider during the reauthorization of traffic safety programs; and finally some specific comments about the long-standing issue of speed limit compliance requirements. I do appreciate the opportunity to speak before you today. I have provided staff with my comments and I will to the best of my ability paraphrase those comments, but I want to make several points and in general I will follow the text.

First and most important, traffic safety is a critical local, State, and national problem. You have heard fatality counts and injury estimates from U.S. Department of Transportation, and statistical forecast of accident trends in the recent General Accounting Office report that you commissioned. The personnel in my agency and I have to deal with the reality of those statistics, not just the numbers and tables and charts, but the life and death on our highways.

April is the start of spring and initiates the rebirth of life in nature. But if April is like any other month in the average year, we will lose about 4,000 people on our Nation's highways. This human and senseless tragedy is certainly most visible in California, the Nation's most populous State. It certainly undermines my personal commitment and the commitment of the personnel within my organization to public safety and service, and underscores the need to use our limited resources in the most effective manner possible.

As sad and frustrating as this aspect of law enforcement can be, there is reason for encouragement. As you know, the national mileage death rate has been gradually improving. In 1974, when the 55 national maximum speed limit came into being, California realized a mileage death rate at 3.2. Over the last few years, it has been declining and reached just a little under 2.1 at the end of 1989, at least based on our preliminary estimates. We have established for our Department an objective to reduce the mileage death rate in the State of California to 1.8 by the end of 1990 and we are encouraged by what we see. During the first three months of 1990, we have seen a 13 percent reduction in the number of traffic deaths in our State, which equates to approximately 160 lives. So we are well on target and we believe we can, in fact, reach the 1.8 mileage death rate by the end of this year.

This improvement in highway safety is due to a wide-range of programs in highway engineering, enforcement, and public education. It is also due to changes in legislation, regulation, and judicial procedures. The point is that many factors contribute to safety improvements, and a good traffic safety program must reflect a balanced approach.

In California, our mileage death rate is lower than it has ever been and, as stated, I think the State's comprehensive approach to safety will cause this trend to continue. Our Governor and legislature have implemented one of the toughest DUI laws in the country with a .08 percent blood alcohol limit. We started a sobriety checkpoint program several years ago and just recently purchased preliminary alcohol screening devices to increase our effectiveness in removing drinking drivers from our highways.

In July, a second valuable tool that will be added is the administrative per se suspensions of driver's licenses of drivers who have been arrested for driving under the influence. We all recognize that driving under the influence of alcohol or drugs is the biggest safety problem facing most, if not all, States and it is deserving of considerable emphasis.

Seatbelt usage is another important contributor to safety. Not only do we have a strong CHP seatbelt enforcement program, but my Department plays a major role working with local law enforcement in the office of traffic safety to increase their emphasis on seatbelt violations throughout the State. In late 1988, I established a California Safety Belt Task Force. The purpose of the Task Force is to coordinate the efforts of Federal, State, and local agencies, our departments of Health and Education, the insurance industry, the news media, safety organization, and others interested in increasing the use of occupant restraint systems by the motoring public. Our goal is to reach a 70 percent safety belt usage level by the end of 1990.

I am happy to report to you that initial surveys indicate that we have achieved our goal. The compliance rate in California has risen from an estimated 25 percent in 1985, the year before our Seatbelt law became effective, to 70.3 percent currently. This substantially exceeds the 1989 national rate of 46 percent. I emphasize that enforcement and public education are equal partners in this success.

As part of our educational efforts, the Task Force, through our Department of Education, contacted all California schools, K through 12, and provided materials to carry out safety belt education activities during the upcoming "Buckle-Up American" week, May 21–28.

In 1989, the California Highway Patrol issued 716,000 citations for safety belt violations. It was the second most common CHP citation, second only to speed, and is in addition to the other outstanding efforts by local law enforcement throughout the State of California to bring about better compliance with our seatbelt statute.

Speed. Speed enforcement is an important area of emphasis for my Department. With all due respect, Mr. Chairman, when I have testified before this committee in the past, sometimes there has been an undercurrent of concern regarding California's commitment to enforcing speed laws. I hope you won't be surprised to hear that I think speed enforcement is very important. We issue more 55 MPH citations than any other State in the Nation, our citations per mile of roadway are better than the national average, we have been characterized as having high penalties for speed violations, and 85 percent of our officers' time is spent patrolling highways with the maximum speed limits.

Speed enforcement is important. About one-third of all arrests are for speed violations. We cite more speeding violators than any other type.

However, I cannot look at this problem with blinders. My resources, like yours, are limited. I must search for the most effective use of those funds. My responsibility to the citizens of California dictates that I achieve the maximum impact by setting priorities. And although speed enforcement is important, it is not our only priority. It is part of our balanced and comprehensive approach to traffic safety.

For example, a new dimension to the safety challenges results from the generally increasing use of illegal drugs by drivers. We have been aggressively meeting this challenge and have recognized the somewhere between 12 and 20 percent of the drivers involved in fatal accidents are under the influence of drugs or under the influence of alcohol and/or drugs. In recognition of that, we have trained approximately 950 CHP officers in drug recognition expert training. That has occurred in the past seven years. The training enables them to better identify motorists who are under the influence of drugs. Because the CHP was the first State agency to enter into this extensive training program, our Department now employs about of all the DREs in the Nation. Now NHTSA is marketing the program to law enforcement Nation-wide and hopes to have a significant impact in traffic safety once the program has been adopted on a Nation-wide basis.

There are a number of other CHP programs that contribute to our improving mileage death rate. These include commercial vehicle inspection and enforcement, drug interdiction, and ethnically-based community education programs, just to name a few.

In addition, there is whole range of programs with safety benefits that are carried out by the California Department of Transportation. In particular, I would like to point out the high priority CALTRANS has given to the installation of crash cushions, median barriers, guard rails, and break-away sign poles. Engineering strategies are of particular importance in reducing the severity of accidents.

As you can surely appreciate, there are many enforcement, engineering, and education strategies that are part of meeting the challenge of traffic safety. Based on our experience with the many facets of this problem, I would like to recommend some guiding principles for the development of the Highway Reauthorization bill.

First, the cooperation between Federal, State, local, and private entities. The Secretary of Transportation Samuel Skinner convened a Traffic Safety Summit earlier this month in Chicago to discuss a number of important safety topics. In talking with the Secretary, he made it clear part of the purpose of the summit was to lay a foundation for a partnership between States and the Federal Government.

I commend this attitude. Concerted, coordinated safety efforts are far more likely to be effective than adversarial or disjointed activities. Federal, State, and local Government, along with the private sector all have areas of expertise and can provide leadership

to address the many and varied traffic safety problems through cooperative programs.

Many traffic safety problems, such as DUI, are national in scope, but there is a diverse range of specific local needs and conditions. To be effective, Federal safety programs should be flexible enough to respond to differing local conditions as well as to take advantage of opportunities afforded by strong local safety laws or programs.

The multi-dimensional nature of safety problems is another important reason for program flexibility. To improve a State's mileage death rate, comprehensive programs are needed that permit a State to customize the appropriate mix of DUI, speed, seatbelt, commercial, and other types of enforcement and education. We do not think that compliance requirements and the distribution of Federal resources should be exclusively focused on any one program area, such as speed, especially if the issue is compliance alone and not safety.

With regard to needed resources, we agree with other highway safety advocates that additional funds will be required to maintain the downward trend in the mileage death rate. The State of California hopes to meet some of our needs with a special transportation funding initiative to be voted on by our voters in June. We hope the Federal Government can afford to increase its commitment as well.

The 55 National Maximum Speed Limit sanctions are a potential fiscal hardship for an increasing number of States. Unfortunately, this type of State/Federal adversarial relationship seems to be increasing, with five States now in jeopardy.

If some kind of direct Federal oversight is required, we believe incentives are more effective in both the short and long term. In the long run, greater Federal/State cooperation is encouraged. In the short run, incentives avoid the counterproductive loss of needed safety funds.

This is the perverse situation facing California where in the name of safety, as much as $28 million in needed Federal Highway funds could be lost through sanctions to California. At a time when California has made significant gains in traffic safety, the loss of Federal revenue will hurt California's traffic safety efforts, not assist them.

The counterproductive nature of sanctions also illustrates our final principle. We believe that safety proposals should be judged by the extent to which they actually reduce accidents and injuries. Hypothetical or hoped-for program results do not reduce society's pain and suffering. We are interested in DUI, seatbelt, speed, and other programs that actually save lives and reduce injuries and prevent property damage. In other words, we want practical, flexible programs that really work; programs that recognize the limitations and opportunities of the real world.

As you know, there is a statutory requirement for monitoring the percentage of traffic exceeding 55 MPH, and consequent fiscal sanctions for non-compliance.

We do not believe this monitoring and sanction process produces real safety benefits. I point out to you, Mr. Chairman, that some of the States with the best 55 MPH compliance have some of the

worst mileage death rates in the country; and conversely, some of the States with the best mileage death rates are facing sanctions.

In light of critiques by the Transportation Research Board, the General Accounting Office, and others, there is widespread agreement that these statutes should be changed. And from the viewpoint of many States, there is widespread agreement on how to change.

To name a few, the National Governors Association, my colleague Peter O'Rourke from the National Association of Governors Highway Safety Representatives, the American Association of State Highway and Transportation Officials, and the International Association of Chiefs of Police are all on record opposing the use of a sanction process for speed limit compliance.

The IACP has gone one step further and as Colonel Tippet from Maryland ably described at your March 22nd hearing, IACP advocates the repeal of the "Federal requirements relating to monitoring and sanction provisions of the National Maximum Speed Limits."

We agree with the IACP position. California also has a practical problem that I mentioned earlier. Because we are in violation of the speed limit requirement that many believe should be changed, as much as $28 million of our Federal Highway funds are in jeopardy. Unless there is Congressional action, we will lose those appropriations on October 1st of this year, which undoubtedly will have a negative rather than a positive impact on our highway safety efforts.

If there is no agreement by October on a substantive revision to the compliance requirement, we respectfully request that a moratorium be imposed to suspend sanctions for fiscal year 1989 and 1990 speeds. This would allow the compliance requirement to be resolved within the context of the Reauthorization bill.

In summary, I think there is widespread agreement that traffic safety is an important issue now, and it will be an even more important issue in the future with projected increases in drivers, vehicles, and travel. California also believes that the Federal Government should have a significant role in traffic safety in the post-Interstate era.

We believe this Federal role should be based on the ideas of equal partnership, mutual cooperation, comprehensive and flexible programs, adequate funding, reliance on incentives, and a strong focus on programs with particular safety benefits that are tailored to the specific needs of the States. Until such a program is in place, we do need your assistance in preventing the loss of funds from sanctions.

California currently has a comprehensive highway safety program, and with the support of many Federal programs, and has achieved a mileage death rate of 2.1 in 1989, and hopefully we will achieve 1.8 by the end of this year. Although this is better than the national average, we are not satisfied and will continue to develop DUI, seatbelt, speed, commercial vehicle, and other programs to save more lives and reduce this mileage death rate even further.

I commend you, Mr. Chairman and committee members, for your interest in traffic safety. Thank you for the opportunity to speak to you today. I will be happy to answer any questions you may have.

Mr. MINETA. Thank you very much, Mr. Commissioner.

Mr. O'Rourke, you mentioned that in fiscal year 1989 that the State of Virginia has begun a program to train police officers in selected jurisdictions to recognize drugged driving behavior. Is that the Drug Recognition Expert Program?

Mr. O'ROURKE. Yes, it is.

Mr. MINETA. And has there been a reduction in drug and alcohol related fatalities as a result of this program?

Mr. O'ROURKE. In Virginia, I don't think we have the data in, but for California, for example, where the program began, the answer is conclusively yes.

Mr. MINETA. Now with regard to the 402 funding, are the 402 funds successful in leveraging local funds, and has that proved successful in terms of the effectiveness of the program?

Mr. O'ROURKE. Yes, it has. As I mentioned earlier, our policy has been—and it is the same in all 50 States—is that we do not fund at 100 percent federal share. When there is a 75 percent federal share and the local agencies contribute a 25% match, they have already made a commitment. As we withdraw federal funds, their commitment has to grow that much larger. In the second year, it is a 50-50 matching ratio. In the third year the role is reversed; the local entity is providing 75 percent of the money.

We recently had an audit, for example, by the Inspector General's office, and in the programs they looked at, every one of them was still going even though federal highway safety monies were no longer being provided. Most of these projects were over two, three, four years beyond the federal grant.

Mr. MINETA. Now do you think the current NHTSA guidelines reflect State priorities?

Mr. O'ROURKE. The guidelines give the states the flexibility to recognize the State priorities. As I mentioned, there are 18 areas within which we can fund highway safety projects. States can fund projects in seven prioring areas, and if they want to do something outside of that, they have to provide added justification. As an example, in California we think pedestrian safety is a major issue and, in fact, we are addressing pedestrian safety with 402 dollars.

Mr. MINETA. Are you saying that a more flexible approach to 402 Highway Safety Grant funding, such as a block grant approach, is less preferable than the current program of categorical assistance as administered by NHTSA?

Mr. O'ROURKE. That would be my opinion, yes. It should be maintained as is.

Mr. MINETA. There is a great deal of interest in flexibility, if not 402, but in terms of trying to give States the ability to maybe come up with their own package of programs. But you are saying it ought to stay more with the—current program.

Mr. O'ROURKE. As I mentioned earlier, if it hadn't been for the 402 program, I don't think we would see the dedication that we have now by the States to traffic safety. If the funds were left to divide up within a block grant program, I strongly believe the 402 program would take a backseat position to other highway programs. I think now it is in the forefront.

There are an awful lot of things going on within highway safety that are spilling over into other public policy areas. There has been

a lot of discussion this morning about congestion, for example. We are doing a lot on this issue utilizing 402 monies to address congestion. For example, we have an innovative program called "Smooth Operator". Maryland has a program called "Drive To Survive." What we are doing is highlighting behaviors that not only adversely affect traffic and cause crashes, but are directly related to congestion. People are very quick to complain about congestion. Our program says, "Look, you can be part of the solution; you don't have to be just a complainer, be a smooth operator!" There is a lot of spillover in from highway safety to congestion management.

As I mentioned earlier, we are doing a lot of brokering with other state and local agencies and grassroots organizations. In the long term, we can have a much more positive effect on reducing the incidents of drinking and driving by our young people. There was a recent study done by Rand Corporation looking at schools within California and Oregon over the last 18 months. The study said smoking programs had a very positive affect on keeping young people from smoking unless they already were; a very positive affect in reducing their experimenting with drugs; but absolutely no affect on them experimenting with alcohol. We are combatting a real big marketing and social issue.

But we do see young people gravitating to more responsible drinking and driving behavior, probably patterned much after the Scandinavian countries. We see young people readily accepting designated driver programs, readily availing themselves of safe ride programs. The 402 funds have been utilized not only to promote those programs but to provide alternatives to when a youngster gets caught in a situation that may or may not involve drinking and driving. It is an amazing process to watch our young people; it reaffirms faith that we are going to make great strides.

We just had a conference in Santa Clara with 900 young people who plan and direct the conference and then they go back to their respective schools and institutionalize programs that address their highway safety needs. That would not be happening in were not for 402 funds which are utilized in conjunction with drug and alcohol programs money.

Mr. MINETA. Even though you don't think that we ought to go to a block grant approach in terms of the 402, keep the program as it is right now; are there other areas where you think there can be improvements made in the 402 program itself?

Mr. O'ROURKE. One area only that I think is a problem. Obviously we need more money. We could do a better job with more money; that is a given. The fact that we do not have any earmarking in the 402 program helps great deal in giving states the flexibility to spend those monies.

But one of the areas that I think maybe we should take a look at is the fact that we put $20 million to spend solely on the enforcement of 55–65 MPH. To be truthful with you, the States are having a very difficult time expending that money, and I speak collectively of all the States. Most of that money is utilized to buy equipment. The States buy airplanes, radar (except for California, needless to say, where unfortunately, I would buy it but Mr. Hannigan can't use it) but States do buy a lot of equipment. Well, you only have to buy equipment once and then maybe you start it recycling it five

or six years down, but for the most part that money goes for overtime for enforcement personnel. As a result, we are burning out officers. States are looking to maximize those 402 dollars. A lot of States are having difficulty in spending those monies.

We ought to have the flexibility to use that money for any police traffic service. Those States that are, in fact, having speed problems should be dedicating those resources toward speed enforcement, but the ones that aren't should have the ability to spread that money out over other police traffic services. I think that is really crucial, given with the fact that alcohol has become part of the war on drugs. The only real enforcement of the impaired driver over and above what is being done routinely by enforcement is the incentive grant program provided to enforcement through the 408 program. That would free up some monies to augment the enforcement of impaired driving programs.

Mr. VALENTINE [assuming Chair]. How would you propose that the combined 408 and 410 programs achieve the program flexibility in the incentive tier, as outlined in your testimony; and at the same time encourage States to adopt the standards currently set forth in each of the separate programs?

Mr. O'ROURKE. As I recall, the 408 program was first authorized in 1982 and that was also about the same period of time that all the States were adopting tougher drunk driving laws. Most of the legislatures at that point felt that they have addressed these issues; they didn't want to address them again. So States were delayed significantly in qualifying for 408 grants. Just a few years ago we only had a handful of States that qualified. Currently, I believe we only have 23 States that currently qualify for 408.

Now, the 408 program can't even support these states that will be qualifying, including California. We got a letter saying we have qualified for 408 funds and yet there is no money left in the 408 this fiscal year. And now we have a 410 program that is funded at $4 million, proposed to go to $8 million, and nobody can qualify for it. So we are repeating history. There is going to be lag time for States to qualify for 410. Our surveys of our own States indicate that, at best, two states will qualify for 410 grants in the near future, unless something really dramatic happens to change the 410 program.

It just seems to me that we ought to make sure that we can continue to support those States that are eligible for 408. Also, adequate funding would encourage states to try to qualify for 408 funds. The 408 program is an easier program for states to qualify for than the 410 program. It is easier for a State to be shooting for that objective than it is for 410 at this time. Combining those programs, I think, makes sense because it would allow for assured funding for the States that are qualifying for 408 and would still be an added inducement for States to move towards 410.

Mr. VALENTINE. You suggest that the administration of MCSAP be shifted to NHTSA. Do you mean that the Bureau of Motor Carrier Safety should be folded into NHTSA?

Mr. O'ROURKE. That is correct. It just seems to make sense to us that the programs that deal with driver behavior should all be rolled together under one entity, simplify the bureaucracies that are involved, allow for more harmonious relationships and a more

systematic approach to dealing with Commercial vehicle driver behavior.

Mr. VALENTINE. All right. It is Chairman Mineta's belief that the California—this is addressed to Mr. Hannigan in Mr. Mineta's absence—it is his belief that the California Highway Patrol has done a good job in enforcing traffic laws in the State of California. Well, let me just read this statement. He says,

> I realize that there are many demands placed on law enforcement communities in each jurisdiction, particularly with the drug epidemic sweeping the country at the present time. As a result of this epidemic and other criminal activities that place demands on law enforcement personnel, traffic enforcement has sometimes been relegated to a lower priority. But studies have indicated that in areas where strong traffic enforcement campaigns have been launched, other criminal activity has been reduced.

The question is, "How might law enforcement strategies be encouraged to place a greater priority on traffic enforcement, in your opinion?"

Mr. HANNIGAN. Well, Mr. Chairman, traffic safety is our highest priority in the California Highway Patrol. But I also agree with the Chairman when he deduces that if there is a concentration against criminal activity and traffic at the same time, they mutually have a positive impact on one another.

My approach in running our organization is to identify potential problems and address them, whether it is drunk driving or speed or seatbelts. I think probably our efforts with seatbelts is the most visible. And I think it is that coupled with our .08 law is the driving force behind the reduction in deaths that we have seen for the first three months of 1990.

Mr. VALENTINE. Excuse me, sir. We have got some votes and we need to find out how many and how long——

Mr. DUNCAN. Mr. Chairman, I have one quick question.

Mr. VALENTINE. Please.

Mr. DUNCAN. I am just curious. We have got this huge deficit and this huge national debt because everybody that comes to us tells us that their problem is a crisis problem and they are not receiving nearly enough funds, whether it is aid to the homeless or the mentally ill or whoever. Everybody tells us how much worse their particular problem of interest is growing. This is the best news I have heard in a long time. I didn't know these statistics for the death rate per 100 million miles driven or per million miles, whichever it is, has gone way down from 5.2 to 1.8, or you are hoping to get it to 1.8.

Mr. HANNIGAN. Very encouraging. We hope to reach 1.8. We are at 13 percent reduction now; if we can hold a 10 percent reduction, we will make 1.8.

Mr. DUNCAN. My question is though that we reach some point where there are diminishing returns. We are never going to eliminate all deaths unless we just remove all cars. Now, where do we reach that point in saying that we have enough being spent on highway safety programs? We have had this great progress; and the easy, simplistic answer is to say, well, one death is too many—and all of us agree that any death on any highway is a terrible and tragic thing—but do you understand my question?

Mr. HANNIGAN. I do, sir.

Mr. DUNCAN. Where do we reach the point where it does us not much more good to pour a lot more money into the highway safety programs?

Mr. HANNIGAN. I think there are two things. You have to go back to 1934, when the mileage death rate in California was 17, and now we are looking hopefully at a 1.8 or if we can get down to 2, that is a significant increase.

Mr. DUNCAN. That sure is.

Mr. HANNIGAN. I think I figured that out one day and if it had stayed at 17, we would have killed about 40,000 people a year just in the State of California. So I think a lot of headway has been made in traffic safety and in highways and vehicle design and enforcement and education. The fact is, for example in California, we are averaging somewhere between 12 and 14 billion miles of travel a year, and you enhance the exposure and the potential for accidents, so you target the mileage death rate. You are going to have accidents; I don't think we will ever reach the point where we will have a zero mileage death rate. But you can do a lot and I emphasize that education is as important as enforcement, they work together in educating our youth. I think you are beginning to see those impacts both in reduction in DUI by our youth as well as more usage of seatbelts.

But I don't know if you ever reach the point where you have a diminishing return in traffic safety. When you have that many cars and that many people, you have to keep working at it and do the very best you can. I think they projected that if we stayed at about 2.4 Nationwide, we would be killing 60,000 people a year. We only have about 28,000 homicides a year in this country, so that is a significant area and I think we should do everything we can to address the problems for the particular States.

The point is we do not have a level playing field. What works in West Virginia will not work in California, or what works in Alaska will not necessarily work in Texas.

Mr. DUNCAN. You have a different situation.

Mr. HANNIGAN. Every State has a different situation.

Mr. DUNCAN. We have to go vote, but what percentage of the Federal Highway dollar is being spent now on highway safety programs, do either one of you know?

Mr. O'ROURKE. The 402 program, for example, is only funded at a little less than $110 million annually.

Mr. DUNCAN. Do you have any idea of what percentage? In other words, it would be a very small percentage.

Mr. O'ROURKE. About 1 percent. As mentioned earlier, I think the Government is getting its best bang for the buck on that 1 percent.

Mr. DUNCAN. Are some States doing much more than other States in this area, or are basically all States doing about the same?

Mr. O'ROURKE. As the Commissioner mentioned, it is not a level playing field, so each State is addressing their needs as they are perceived within their own State boundaries, but they are all striving to reduce the mileage death rate in their individual States. As I mentioned earlier, a number of States have had extreme success, and the mileage death rate in every State is coming down.

Mr. DUNCAN. Well, I guess we have to go vote.

Mr. VALENTINE. Gentlemen, we have got a 15 minute vote followed by a series of 5 minute votes. I am going to try to squeeze in one more question and then we will get back here as soon as we can.

What are the greatest needs of the California Highway Patrol in your opinion in terms of manpower, funding, and other possible limitations to the effectiveness of the Patrol?

Mr. HANNIGAN. Our Governor has added 150 personnel to our Department over the last three years. This next fiscal year he will be adding another 150, so we are getting the additional resources we need. We have to continue to examine the data that comes out and identify and target particular problems. I think the FARS program could assist the States in that endeavor.

I am not one who is convinced that monitoring speeds in the Interstate system and the money that is spent to do that is best spent. If you take a look at the statistics and you identify where you have potential problems, if it is speed, then have the Federal Government work with that State, design programs that will bring down those speeds and, in turn, bring down the deaths that are caused by it. If it is DUI, it should be a program that is designed for that State for its particular needs and problems either at the State or local level. And, again, the FARS data, if it is collected correctly and there are adjustments made to the collection of that data, can tell the States where they need the particular assistance.

We have a SWTIERS program in California that is very specific and will tell us what causes accidents and what is the primary collision factor. Speed, for the most part, is a very low contributor to the largest percentage of our fatal accidents, it accounts for about 10 percent. And the vast majority of those are off the freeway system.

Mr. VALENTINE. We will suspend until we can finish these votes, and then we will return.

Mr. HANNIGAN. We'll stand by then, sir.

Mr. VALENTINE. Thank you.

[Recess]

Mr. VALENTINE. Let me get started again with apologies for that delay. I think that is the last recorded vote, so we won't have that kind of problem.

Mr. Hannigan, with regard to drug and drunk driving, can you tell us what the percentage of drugged driving incidents are as compared to drunk driving incidents that you have discovered through your enforcement efforts?

Mr. HANNIGAN. With our DRD program, Mr. Chairman, the best we have been able to determine right now, since our statute covers both alcohol and/or drugs, we have not been able to break that out in our SWTIERS or our traffic records system other than based on the estimates from the officers in the field themselves, the 950 we have currently out there. The best estimate we have been able to determine is running in the 15 percentile of the arrests we make. The Patrol in California makes 740,000 drunk driving arrests a year, local law enforcement will apprehend about another 200,000. California alone arrests about 27 to 28 percent of the drunk drivers

Nation-wide. So it is a very aggressive program, both with the Patrol and local law enforcement.

Mr. VALENTINE. Are you prepared to comment on the problem, if any, with respect to highway safety that is created by these trailers, where you have two or in some instances three? California law allows a cab to pull——

Mr. HANNIGAN. Doubles but not triples. Triples are not allowed in California.

Mr. VALENTINE. Just doubles?

Mr. HANNIGAN. Just doubles, sir.

Mr. VALENTINE. Are you in a position to make any comment as to what contribution the use of doubles has made to highway safety or the lack thereof in the State of California?

Mr. HANNIGAN. We have not been able to recognize any significant traffic safety problem with doubles. Under Federal statute, as you are aware, I believe they are limited to 28 or 28-1/2 feet maximum if it is a set of doubles.

Mr. VALENTINE. Well, that is the Federal statute, but there are all kinds of grandfather arrangements, as I understand it, which have blown that—not in California, perhaps, but other States—which have caused that to remain the patchwork that it was.

Mr. HANNIGAN. That's correct. And I know some States allow triples. Our Department of Transportation, CALTRANS, has had some difficulty with concept of triples—well, the tracking problem is a significant issue, when they go to make a turn and the width of the turn that is required to get that around a corner. CALTRANS has some very preliminary statistical data that shows it does excessive amount of damage to curbings and railings and signs. But we have not been able to identify a traffic safety issue from the standpoint of contributing at least significantly to injuries or deaths on our highways because of the doubles.

Mr. VALENTINE. All right. Back to the other line of questions, can you relate your experience with the photo radar and its possible function as one of the new technological tools for promoting highway safety.

Mr. HANNIGAN. We, personally, have no experience with photo radar in our Department. There is one city, Pasadena, that is experimenting with photo radar at this time. I cannot testify to the impacts that device has had on traffic safety within that respective city, although I do know it generates a lot of citations.

I would like to address one issue, Mr. Chairman, and that is probably seatbelts more than anything else I think has been a significant contributor to traffic safety. Over the last six months I have had all officers investigating accidents—we investigate fatal accidents and they have tracked a little over 1,000 accidents—and I have the officers specifically, based on their expertise in the investigation, whether passengers or drivers in the vehicle did or did not survive because of seatbelts. And out of that 1,000 accidents, about 28 percent of the people killed were wearing seatbelts; the other 72–74 percent were not wearing seatbelts and the officers estimate 64 percent of those people would have survived if they had been wearing a belt.

Mr. VALENTINE. Say that again, please.

Mr. HANNIGAN. It is estimated that 64 percent of those people would have survived had they been wearing a belt. In other words, we are talking roughly 450 lives that would have been saved in just a six-month period if belts had been used by those people. That is a significant start when you look at those type of numbers. Certainly it has been the focus of our officers with that type of knowledge and experience that has driven them from the standpoint of enforcing the law to use public education. We have used some graphic examples of cars going off one thousand foot cliffs and the individuals walking away versus a minor accident where somebody is thrown out of the car and killed. That is why we have concentrated so heavy in seatbelts, coupled with our DUI and our speed enforcements and other accident-causing violations that occur on respective beats.

I think that is the trend the Federal Government ought to go. I think they ought to work with the States—we have some 16 States that don't have seatbelt statutes—I believe the Federal Government should work with those State legislatures to convince them of the benefits that could be derived if nothing else from just a seatbelt statute.

Mr. VALENTINE. That's a good point. I want to make a statement and then ask you if you developed any statistical information on this in the State of California. I was somewhere recently, I think maybe the State of Pennsylvania, where there was—maybe this was a rental car, I don't know—but there were instructions, there was an admonition as to how to wear the seatbelt, to put the belt that goes across the bottom part as opposed to the shoulder strap down low on the person's lap as opposed to having it up over the stomach. This statement said that it could cause severe injury if it were worn too high. Now that might have something to do with the size of one's stomach. But have you developed any kind of statistical information that would shed light on that kind of thing?

Mr. HANNIGAN. Well, I think you are talking about the automated system where it closes across you and you have to use the lap belt in addition to that.

Mr. VALENTINE. No, I'm talking about the system where you just pull it up and over and part of it comes across your lap and part across your shoulder.

Mr. HANNIGAN. Right. Some of the new systems, when you close the door, the shoulder harness goes across but you have to manually connect the lap belt.

Mr. VALENTINE. Yes, but what I am talking about is the lap belt.

Mr. HANNIGAN. Just the lap belt. Well, all systems I have seen are 3-point harness here in the States. I can't think of any—I can tell you an interesting story on a radio show that was being done, an individual called in and said, "Well, I was wearing one of those seatbelts and had a head-on collision." He said, "I got my legs crushed and I got all these medical problems." And our former Commissioner asked him, he said "What would have happened if you hadn't been wearing that belt?" And he said, "I would have been killed." The point being, yes, there may be some injuries from a seatbelt, but certainly the use of a belt will in most cases prevent a needless death.

Mr. VALENTINE. Yes, I agree with you. It is a shame that there are that many States that don't recognize that. One of my four children, the youngest, my daughter's life was saved because she was wearing a seatbelt. She had to be cut out of a car she was driving about three or four years ago, and she had a seatbelt on and that is what kept her from going through the windshield and being killed.

We don't have any other members here to pester you.

Mr. HANNIGAN. You are not pestering me.

Mr. VALENTINE. That is all the questions. We do appreciate your coming here and sharing this information with us. Thank you very much.

Mr. HANNIGAN. Thank you for the opportunity.

[Mr. O'Rourke's prepared statement appears on page 1913.]

[Mr. Hannigan's prepared statement appears on page 1771.]

Mr. VALENTINE. Our next witness is Mr. Charles K. Dawson, the President of American Traffic Safety Services Association. He is accompanied by Ms. Caroline Carver, Director of Government Relations. Welcome. Your statements as presented to us will appear in the record en toto. We would encourage you to summarize.

TESTIMONY OF CHARLES K. DAWSON, PRESIDENT, AMERICAN TRAFFIC SAFETY SERVICES, ACCOMPANIED BY CAROLINE CARVER, DIRECTOR, GOVERNMENT RELATIONS

Mr. DAWSON. Thank you, Mr. Chairman. I am Charles Dawson, national president of the American Traffic Safety Services Association.

ATSSA is a national trade association in its 20th year representing 700 companies and individuals in the traffic control industry. Most of the traffic safety equipment and services used on our highways are provided by ATSSA members. Our membership also includes public officials at all levels of Government who are concerned with traffic control and the safety of the motoring public.

In two major national consensus efforts, the Secretary of Transportation's National Transportation Policy and the 2020 effort sponsored by AASHTO and the Highway Users Federation, enhanced transportation safety was mentioned as one of the top national priorities. Both reports called for renewed Federal leadership. Today, with your permission, I would like to make some specific recommendations in the areas of improved safety for aging drivers; improved work zone safety; uniformity of standards for traffic control devices; comprehensive safety management; reducing fatalities on rural interstate highways where speed limits have been increased to 65 mph; and funding and the Federal role.

First, aging drivers. We know intuitively that highway safety improvements reduce fatalities, but we don't often have figures that show so persuasively that well-spent dollars in safety improvements can dramatically save lives. In May of 1989, the New York State Thruway Authority announced that a safety program designed for older drivers would be undertaken on the entire New York State Thruway system. Among the things that New York did were increase pavement markings from 4 to 6 inches in width and painted those markings twice a year; they upgraded signs and road-

side delineaters with brighter state-of-the-art materials, and in some cases they used larger lettering on signing with new, higher intensity sheeting.

This program has been in existence a short time but the early figures are very encouraging. There was a 12 percent decrease in fatalities in 1989 over 1988. These decreases occurred on a highway that already had a lower fatality rate than the national average, and show once again that low-cost safety improvements can result in reduced fatalities.

In 1989, the New York Thruway fatality rate was .78 per hundred million miles travelled, two-thirds less than the national average of 2.2. The New York experience shows that safety improvements aimed at older drivers ultimately improve roadway safety for all drivers. Currently, 12 percent of the U.S. population is 65 or over, and in the next 30 years the number will more than double. The present highway system was designed for an average driver that is far removed in age and ability from today's older driver. With this in mind, ATSSA supports the findings of the National Academy of Sciences, reported through the Transportation Research Board in a Special Report, Transportation and an Aging Society. And we would like to commend this committee for making this older drivers study a part of the 1987 Highway Act.

Specifically, we would recommend upgraded marking and signing standards and better maintained pavement markings and signs; and improved positive guidance through the work zones. Improved positive guidance simply means that the motorist should be provided with information where they need it, when they need it, and in the form they can understand to be able to avoid hazards and safely navigate the roadway environment. Congress should direct the Secretary to propose rulemaking that would establish revised and improved visibility and legibility standards for signs and markings to accommodate all drivers, including the elderly and those with diminished visual capabilities.

Next, I would like to talk about work zones. Last year when we addressed this committee, we reported that work zone fatalities had shown a 40 percent increase from 1982 through 1985. This year we are saddened to report an additional 8 percent increase in work zone fatalities in 1988—756 deaths in one year alone. These disturbing figures explain why one of our primary objectives is to improve the level of safety in construction work zones. This continued rise in fatalities shows how badly we need a work zone safety program in the 1991 Highway Act.

We think that education and training of persons responsible for work zone traffic control are of utmost importance. This is so important to us that in 1977, ATSSA initiated a certification program developed as a joint effort with the Institute of Transportation Engineers and the Federal Highway Administration. The Worksite Traffic Supervisor Program sets industry standards that have resulted in real improvements in the quality of work zone traffic control. Eight States now require some degree of certification of worksite traffic supervisors, but all States should require this.

We suggest legislation that would specify that each State highway department designate and require the contractor to designate for each project, a person trained and certified who will have the

responsibility and authority of assuring that the provisions of the Traffic Control Plan and other safety aspects of the work zone are effectively administered.

To ensure enough funding is available for adequate traffic control, the FHWA has recommended the use of individual bid items for traffic control devices. Yet many States do not do this. Therefore, we suggest that each State highway department use individual bid items for providing, installing, moving, replacing, and maintaining traffic control devices and safety systems.

Many States do not collect work zone accident data, or if they do, it is collected inconsistently. There is no requirement for collecting accident data in work zones and it is difficult to obtain this information from the States. Each State highway department should be required to collect uniform data on all work zone accidents. They should also analyze and use this information to correct deficiencies and to improve future traffic control plans.

FHWA should effectively monitor work zone safety practices in the States and report on the progress of the States to Congress. In order to encourage States to utilize superior traffic control devices and procedures and reduce serious losses now occurring in work zones, 100 percent Federal funds should be made available for work zone traffic control.

We think it is important that there be consistent uniform standards for traffic control devices for all classifications of roadways regardless of the jurisdiction or user agency. Unfortunately, this is not the case. To remedy this, we recommend that the Secretary of Transportation be specifically required to establish standards and practices for the design and use of traffic control devices. The location and design of all traffic control devices shall conform to nationally uniform standards and practices.

Unfortunately, State and local jurisdictions do not have adequate funding to upgrade signs or pavement markings, even though the Federal Highway Administration's Report on Highway Safety shows that in these areas alone, we receive the maximum benefits in terms of lives saved and injuries prevented for every safety dollar spent. The annual Report on Highway Safety Improvement Programs, from the Office of Highway Safety, Federal Highway Administration, states that the number one improvement which has most effectively reduced fatal and injury accidents at the lowest cost are traffic signs at a benefit/cost ratio of 20.9 to 1.

We find categorical safety programs, while helpful in calling attention to vital safety problems and challenging State and local Governments to provide for lifesaving safety improvements, have fallen short because they are underfunded and underrated. Oftentimes, these programs are not coordinated with the regular construction programs. Safety work should be done as part of 3R work, not as an afterthought or, worse, overlooked altogether. Because safety has been categorized into narrow and low-funded programs, it is often the last thing to be considered.

In light of these substantial human and economic benefits even modest expenditures in the safety area provide, we would strongly recommend that Congress ensure that an adequate portion of the overall transportation funding be directed to achieving these safety objectives. The next Highway Act should ensure that States engage

in safety construction work as part of their project requirements in performing 3R work.

Each State should be required to have a highway safety management program, approved by the Secretary. Listed in our written testimony are some points that we think are important to such a program.

The current 65 mph limit increases make it additionally important for improved signing and adequate safety standards. ATSSA supports the Center for Auto Safety and its recommendations that each State raising its speed limit to 65 mph be required to improve the highway to the highest levels for design and traffic control, including larger and brighter signs, improved pavement markings, and the use of other state-of-the-art traffic control devices.

More than 45,000 people are killed and 3 million injured in traffic accidents each year. Because of the human cost, this produces tremendous economic cost as well as an additional burden on our overtaxed health care system. If vehicle miles traveled doubles by the year 2020 as expected, fatalities could increase to 90,000. In human terms, this is horrifying. In economic terms, it is devastating. Many of these injuries are debilitating requiring enormous attention and cost. Because of this, safety considerations must be an integral part of every aspect of the new Federal Highway Program.

For this reason, ATSSA has served as a member of the Advisory Committee on Highway Policy. We support the policy recommendations of this group that the Federal Government must provide increased funds from a permanent and reliable source that will correct existing deficiencies and meet future needs. We also support their second principle which is that the highest priority of the National Surface Transportation Program must be to preserve the physical integrity, enhance safety, and increase the effectiveness of existing highways, roads, bridges, and public transportation systems.

In order to meet these national objectives, we feel that there must be an increase in the authorization levels of all highway safety programs.

At a time when our country is frantically searching for ways to reduce the skyrocketing cost of medical care, a modest requirement that we make to improve safety on our Nation's highways could make a substantial contribution to this overall effort.

Specifically, we would request a significant increase in the FHWA-administered portion of 402 funds. This investment would result in the reduction of lost lives, property damage, and liability costs each year. Separate Federal funding categories for the training of personnel in work zone traffic control; require that products and services that enhance safety and improve traffic operations be included criteria for all Federal 3R and 4R programs; and lastly, that the Federal Highway Trust Fund should be made permanent. Remove it from the unified budget and release it from obligation limitations. All interest earned, and I understand that is more than $1 billion annually, should be released to the States and local Governments, and the balance of the Trust Fund should be drawn down to a reasonable level of $2 or $3 billion.

Mr. Chairman, this concludes my oral testimony. I will be happy to answer any questions that you may have.

Mr. VALENTINE. Thank you, Mr. Dawson. We hear a lot about the needs of aging drivers, and maybe the answer to this question I ask is obvious, but what specifically is the effect of aging on a driver's ability to respond to traffic control devices?

Mr. DAWSON. Every 13 years the visual acuity is cut by one-half in a driver. By age 59, we need eight times the light that is required for a 20 year old to see the same thing. Now this doesn't even take into account the reaction time. Older people don't have the reaction time that a younger person has. We have a harder time as we get older—and I am getting that way myself—in reacting to stimuli other than just the driving the car itself. But the visual acuity is the big problem.

Mr. VALENTINE. I must confess that I can tell a little difference in myself, especially at night it is more difficult to see.

You say that safety work is often not included as part of 3R work. Would you tell us for the record just what you mean by that, and how is it overlooked?

Mr. DAWSON. Well, for instance, say you are putting a 5 to 6 inch lift on asphalt, resurfacing, and at the same time, you have a guard rail that is adjacent to this job. If this isn't raised to the proper height, you have created a hazardous situation. If you resurface a highway and the resultant speeds are higher, you need to have a bigger and brighter sign or a newer sign to go along with that. We need to do the thing in its entirety rather than piecemeal.

Mr. VALENTINE. Of the eight States that require some type of certification for work site traffic supervisors, have there been any reductions in fatality rates in work zones in those States?

Mr. DAWSON. It is a pretty difficult question to answer because, as I alluded to in my testimony, the statistics and the information we are getting back from States really isn't complete and it is hard to draw any conclusions. We talked with the State of Georgia and they have had a certification program in effect for several years. They claim that over a five year period, accidents in the work zones are only 25 percent of what they were before the instigated the program. Colorado has been successful in their program. But we really don't have the information other than people telling us that they feel it is better, other than these instances that I have talked about.

Mr. VALENTINE. One final question. What would you say are the leading factors that contribute to highway fatalities in work zone sites?

Mr. DAWSON. I believe it is the lack of positive guidance. People need to be aware of what is coming up and what they have to do, where they have to go. Most people are willing to go around these construction zones safely, but they really haven't been shown where and when they are to make their moves. I believe it is an educational process with the driver, and we need to set the jobs up properly. We need certification for traffic control supervisors not only where they are trained, but where they have also had little time with practical experience working with people who are trained.

Mr. VALENTINE. Thank you, sir.

Mr. DAWSON. Thank you.

[Mr. Dawson's prepared statement appears on page 1733.]

Mr. VALENTINE. We are going to accommodate some colleagues. We are going to change the schedule briefly, and I will now recognize the panel to be introduced by Congressman Emerson and Congressman Glickman. If you gentlemen are ready and will come around, we will be happy to hear you now. The panel consists of Mr. Walter Wildman, Associate Director; and Doctor R.E. Haefner, consultant and Director of Governmental Affairs, Interstate 66 Project.

Mr. Emerson.

Mr. EMERSON. Mr. Chairman, I am happy to say that we have here with us today representatives of the Interstate 66 Project; the Executive Director, Mr. Glen Dockery, from Wichita; the Associate Director from my hometown of Cape Girardeau, Missouri, Mr. Walter Wildman; and the Director of Governmental Affairs, Mr. Lonnie Haefner, from St. Louis.

I know that this dedicated group has been working diligently to gather support for their proposal, which is essentially to build a trans-America highway connecting Interstate 66 right here in Washington to San Luis Obispo, California.

Congressman Glickman and I have been working very closely together on this project. I am pleased that the I-66 steering committee has been able to travel here today from the midwest to present their case to this subcommittee. I hope that as we proceed in our deliberations, the members of the subcommittee will carefully consider this project and the request for a feasibility study.

I am pleased at this time to yield to my colleague and good friend, Mr. Glickman, from Wichita, who will present the panel.

TESTIMONY OF HON. DAN GLICKMAN, A REPRESENTATIVE IN CONGRESS FROM KANSAS

Mr. GLICKMAN. Thank you very much, Mr. Chairman. We thank you very much for taking Mr. Emerson and me and this panel out of order. We appreciate it and it has been inscribed in our own personal books, as well as your personal books, and whatever books count, it is in there.

Mr. VALENTINE. The book of life.

Mr. GLICKMAN. Mr. Chairman, I have a full statement which I would ask to be made a part of the record. My statement will refer to one other issue besides the I-66 issue, which has to do with a highway in Wichita, U.S. 54. The street in Wichita is called Kellogg. I have asked that your committee consider basically two components of that. One is a freeway link between our airport and downtown Wichita. The city has determined that the project will cost $16 million. The city is committed to provided $4.7 million, and therefore we are asking for $11.3 million in Federal funding.

The other thing is a interchange at Kellogg and Oliver, which is on the east side of Wichita, high volume traffic area, and it is a high priority project under the State of Kansas Federal Aid Highway Act of 1987. That will be a part of my record. The State has passed the largest highway bond issue in its history, $2.6 billion, that the State has committed to participate in this. It is a part of the issue that I hope next year we will be able to work on with you, and I wanted to at least alert you to that.

The second thing, Mr. Chairman, has to do with I-66. The idea of developing a 2400 mile interstate corridor stretching east to west, southwest to northeast across this great country of ours. We are asking for the authorization of a feasibility and environmental impact study to develop this highway termed the I-66 Corridor. It would incidentally go through Wichita, Kansas, and Cape Girardeau, Missouri, and then on through Kentucky, probably West Virginia, Virginia, starting in the southwest of this great country of ours. Doctor Lonnie Haefner, Director of Governmental Affairs for I-66 Project; and Glen Dockery, Executive Director of the Project, are here and they will discuss it in greater depth. The Mayor of my city of Wichita, Bob Knight, has assumed the chairmanship of the National Steering Committee for the I-66 Project.

It is something we think is important for the country, and your committee would be asked to approve a feasibility and an environmental study. I would hope that such a study could be authorized and that the subcommittee would closely evaluate its results and consider future funding to create this new east-west interstate across this great country of ours. It is something Mr. Emerson and I feel very strongly about, running through both of our respective home towns.

Now I would like to introduce Doctor Haefner to tell you a little bit more about the project.

I thank you very much for letting us come in here in advance. If possible, Mr. Chairman, I would like to be excused because we are over in appropriations at this very moment. Perhaps Mr. Emerson could stay here for a little bit if there are any questions of us. So we thank you very much.

[Mr. Glickman's prepared statement follows:]

TESTIMONY OF CONGRESSMAN DAN GLICKMAN (KS)
BEFORE THE HOUSE PUBLIC WORKS AND TRANSPORTATION
SUBCOMMITTEE ON SURFACE TRANSPORTATION
APRIL 24, 1990

MR. CHAIRMAN AND MEMBERS OF THE SUBCOMMITTEE: Thank you very much for allowing me to testify before you today. I am here to request federal funding assistance for three different projects affecting my Congressional district as part of next year's highway reauthorization measure.

First, I would like to bring to your attention my Congressional district's urgent need for $32.3 million of federal funding for improvements on Kellogg Avenue (United States Highway 54).

There are two components of the needed expansion of Kellogg/US 54. The first pertains to the freeway link between Mid-Continent Airport on the west side of the city and downtown Wichita. The city of Wichita has determined this project will cost $16 million of which the city is committed to provide $4.7 million. On behalf of the city of Wichita, I request this Subcommittee authorize $11.3 million in federal funding to assist the city in completing this needed work.

Presently, the only impediment to efficient travel from the central-business district to the airport is the Dugan Road interchange on Kellogg/US 54. The west side of Wichita has been the fastest growing residential area in the city over the past decade. This population mass is contributing markedly to the travel demand on Kellogg, but residential growth explains only part of the congestion problem.

Commercial development in the western part of the city has steadily grown, particularly at or near the Kellogg and Dugan exchange. It is anticipated that 530,000 more square feet of retail space will be added in this immediate area over the next decade, further increasing significantly the traffic demands in the area.

Projected traffic volume of 74,000 vehicles per day indicates the need for a six-lane, controlled access freeway. A frontage road system on both sides of the freeway will be necessary to allow local access to abutting properties. Federal funding is necessary to ensure that the city meets the dual needs of serving the abutting development while providing safe, efficient operation to through traffic on Kellogg/US 54.

Additionally, it is important to remember the federal government already has made a strong commitment to Wichita's Mid-Continent Airport, and this investment now must be protected with an efficient highway to move travelers from Wichita and throught the midwest region to the airport. Without such improvements in the road leading to the airport, the benefits derived from recent airport improvements will not be fully realized by residents of the region. Further, commerce in the area will be jeopardized without an efficient road, making it more difficult for the city to generate increases in local revenue.

A key factor to address these mounting traffic needs and deficiencies along Kellogg/US 54 is the expedited implementation of this $16 million improvement to the Kellogg at Dugan interchange. I urge the Subcommittee to assist the city by providing a federal share of $11.3 million.

The second component of work on Kellogg/US 54 in need of federal assistance is the interchange at Kellogg and Oliver. The estimated cost of this portion of work is $42 million, of which the city of Wichita can provide half the funding. I request that the Subcommittee assist the city and provide the matching $21 million.

This area along the East Kellogg corridor is an equally critical link in the transportation network as the previous Kellogg project I highlighted. This component of Kellogg/US 54 serves over 40,000 vehicles per day and connects major regional roads such as I-35 (the Kansas Turnpike), I-135, and K-96 east of the city with the central city. Like the exchange at Kellogg and Dugan, the project I previously highlighted, congestion and operating levels at the Oliver exchange have intensified in recent years as a result of development in the eastern sectors of the city.

Traffic volumes along this corridor have nearly doubled in the last twenty years and are projected to double again during the next twenty years, have created a breakdown of service levels all along this corridor during peak hours resulting in high accident rates. Construction of an interchange on Kellogg at Oliver and a controlled access freeway will alleviate a major traffic bottleneck and high accident segment in the city.

This project is listed as a priority project for the State of Kansas under Title I Federal Aid Highway Act of 1987. This East Kellogg corridor is also among the top transportation priorities of the city of Wichita. Eastern and Northeastern Wichita have been the primary economic development growth areas in the city over the past 15 years.

Completion of improvements to the US 54 corridor and the K-96 Bypass will enhance opportunities for development in this half of the city and increase the area's economic potential. Therefore, I request that the Subcommittee provide $21 million to match the local contribution.

Without question, Kellogg/US 54 is the most important road in my community, and holds the key to future growth of the city. It is the link between two interstate transportation systems, I-135 and I-235. Kellogg/US 54 serves as the major east-west traffic artery in Wichita, and is the only east-west highway capable of being upgraded to a six-lane freeway. This is important because of the tremendous traffic congestion along this road as a result of Wichita's strong growth during the past twenty years. While our community has expanded in every direction from the central city, our highway system has not kept pace, and hence transportation mobility is stymied by this antiquated thoroughfare.

Several studies have been made over the past two decades to identify ways to alleviate east-west traffic congestion within the city of Wichita. The recurring conclusion in these studies has been that Kellogg/US 54 will continue to be the heaviest traveled east-west artery in the city, even after major improvements to parallel streets are completed.

With its access to downtown, it is necessary that Kellogg/US 54 be efficient if Wichita is to be successful in revitalizing our downtown area, one of my city's key objectives. City leaders are actively working with developers to construct a first-class hotel in downtown. An efficient road would enhance our ability to attract major conventions, as a good highway system would accommodate people traveling to our city either by air, or by using the highway system and improve access to downtown.

In 1985, the city of Wichita enacted a one cent sales tax, of which one-half has been set aside for street, highway and bridge improvements. While the city has collected nearly $13 million annually for road improvements and $18 million of unappropriated sales tax revenue, these dollars are not sufficient to meet the city's needs, which exceed $400 million worth of road improvements alone. Last year, the State of Kansas enacted a $2.6 billion highway improvement program, of which $600 million will go to system enhancements. The State also increased the sales tax, motor vehicle registration fees, sales tax transfers and committed to a bonding program to help fund highway improvements. Although the state program is a major step forward in financing highway needs, the requests for dollars far exceeds available funding. The city, therefore, cannot be assured of state matching dollars and must look to the federal government for assistance.

Finally, Mr. Chairman, I would like to bring to the Subcommittee's attention the request that will be presented in just a minute by the I-66 Committee, for inclusion in next year's highway authorization bill, a feasibility and environmental impact study to develop a 2,400 mile interstate corridor stretching east to west across America.

Termed the I-66 corridor, it would create jobs and increase accessibility, tourism, and economic impact throughout this nation. Recently the headquarters of the National Steering Committee was moved to Wichita, a city through which the current proposed highway runs, and Wichita Mayor Bob Knight was made Chairman. I have seen the hard work which has been performed by the committee to secure state and local funding along the route.

Only two major east-west highways exist in the United States, Interstates 40 and 70. The transcontinental Interstate 66 project as conceived and presently proposed would traverse the country along an alignment generally midway between I-40 on the South and I-70 on the North. The initial conceptual 50 mile wide corridor would cross parts of 12 states. Interstate 70 was constructed to handle 7% truck traffic, but is currently handling nearly 33%. I-40 has an even higher level of truck transportation at this time.

The need for relief on the east-west interstate system is crucial to avoid deteriorization and system overload. Further the mileage savings will range between 200-400 miles off of the current transcontinental route from California to the population centers in the northeast. It will also allow trucks to bypass major metropolitan communities with their already heavy local traffic. An added benefit would be the opening of the north rim of the Grand Canyon for tourism and major access to economically depressed areas of the Mississippi Valley and Appalachia.

I encourage the Subcommittee to listen to the comments of the I-66 project Committee and to strongly consider their request to provide federal assistance to fund a feasibility and environmental impact study evaluating the merits of their proposal. I also hope, should such a study be authorized, that this Subcommittee will closely evaluate it's results and consider future funding to create this new east-west interstate. Again, thank you for allowing me this opportunity to testify.

Mr. Haefner.

Mr. VALENTINE. Mr. Haefner, welcome.

TESTIMONY OF R.E. HAEFNER, DIRECTOR OF GOVERNMENTAL AFFAIRS, INTERSTATE 66 PROJECT, ACCOMPANIED BY GLEN DOCKERY, EXECUTIVE DIRECTOR, AND WALTER WILDMAN, ASSOCIATE DIRECTOR

Mr. HAEFNER. Thank you, Mr. Chairman. We appreciate the opportunity to offer testimony on the I-66 Corridor Project.

The past two years has seen a serious examination of the need for a new national statement of surface transportation policy. Several stimuli have spurred professional and trade association groups to undertake such a review and document their findings. The most relevant issues appear to be the doubling of surface travel of man by the year 2020; continued urban congestion and gridlock; a 50 percent decrease in American productivity over the last decade tied to lagging infrastructure investment; direct negative impacts of the above on our international trade processes; the closing of the interstate authorization in 1992; related needs to identify new highway corridors which serve post-interstate demographic and economic growth patterns and serve rural America's accessibility needs; the need for increased highway funding to accommodate the above travel of man growth; improve our domestic productivity and effectiveness in international trade.

In light of the above, this testimonial document is a proposal to request funding for a feasibility study of a 2,400 mile corridor stretching east to west across America. Termed the I-66 Corridor, it will yield significant national increase in accessibility, tourism, economic impact, and intermodal avenues for international trade. The rationale for the presence of the Corridor is the fact that only two major east-west flows exist to process travel across the U.S.—that of Highway 40 and Highway 70. Separated by up to 350 miles, the result is a lack of direct travel capabilities through America's heartland, linking major rural producing areas with major urban and rural centers.

Further, as the interstate authorizations draw to a close in 1992, it is appropriate to yield opportunity for a new review of America's corridor patterns. The post-interstate age must address several germane questions—How have population and activity centers shifted in the U.S. in the last decade of interstate construction? What are the opportunities for growth in the future of the U.S.? How can major highway corridors help such growth be achieved?

The transcontinental Interstate 66 Project, as conceived and presently proposed, would traverse the United States along an east-west alignment generally midway between I-40 to the south and I-70 to the north. The initial proposed 50-mile-wide corridor would cross all or parts of the following States: California, Nevada, Arizona/Utah, Kansas/Oklahoma, Missouri, Illinois/Kentucky, West Virginia/Ohio, Virginia/Maryland.

The approximately 2,400 mile long route is expected to originate in the vicinity of existing I-5, which is located east of the California coastal ranges and in the Fresno-Bakersfield valley, and thence run eastward through the Sierra Nevada Mountains, generally

across the States noted above, with an eastern terminus in Washington, D.C., termed the northern option, or Norfolk, Virginia, termed the southern option.

The western two-thirds of the corridor is located across areas that are not adequately served by present Interstate Highway System and which need improved transportation facilities to make a significant area of the Nation's recreational and scenic resources available to the population and to encourage economic development.

The western one-third of the corridor will ultimately require extremely careful analysis for final route identification because of environmental considerations. The middle one-third of the corridor appears to present few issues, except possible local issues. The eastern one-third of the corridor may present areas with expanded State/local issues as it passes through areas with historic significance or generates environmental concerns.

Preliminary cost analysis has been performed, resulting in an initial cost range of $17–$17.5 billion for the route. This will be further refined with the use of detailed cost modeling by the engineering team over the next few months. As noted in the previous paragraph, significant environmental issues may arise during future detailed studies.

The engineering cross-section associated with the alignment is that of high-type, Interstate design standards which include a 200–350 foot right-of-way and local service frontage roads. The design speed is conceived at 70 mph, with grades and curves within acceptable Interstate standards. Originally conceived as two 12 foot lanes in each direction, it may be developed as three lanes in each direction, with one lane dedicated as an exclusive truck lane. Subgrade, subbase, pavements, and related geometrics would be of design and depth to accommodate heavy weight trucks sanctioned in the 1982 Surface Transportation Assistance Act. The economic benefits of such operation have been thoroughly documented in the Transportation Research Board Special Report 223.

In addition, in keeping with the potential for increased performance from our highways, the above cross-section may be increased to 350–450 feet, and three lanes at 14 feet per lane, with an exclusive truck land, and design speeds in the 80–100 mph range. This is possible, though costly, to yield an "autobahn" type of performance level on our Nation's highways. No cost figures have been run on this at the moment, but they will be significantly higher than those above. Much will depend on design standards foreseen by FHWA for post-Interstate systems conceived to have major impacts on national economic development.

As stated earlier, a doubling of national travel demand is expected by the 2020. The presence of I–66 will reduce traffic on I–40 and I–70 by approximately one-third, and will yield a longer life of useful traffic flow for those facilities. In addition, as the truck percentages in each system are expected to be in the 20–35 percent range, the removal of truck traffic from the stream can be expected to reduce accident rates on facilities by about 20 percent. This is a significant reduction. Interviews with truckers have indicated that the presence of the I–66 corridor will yield a route travel time reduction of up to 400 miles, essentially one-half day of travel, or an

equivalent of up to two to three days per month. This is truly significant, yielding increased productivity of the trucking system, shorter shipper delivery times, and resultant fuel savings of $40 to $80 per run, resulting in an annual savings per truck-tractor unit of $7,000 per year.

In addition, this route allows a direct linkage of west- east deep water ports to midwest railroads, and travel time from the west coast to the gulf coast and east coast ports within one-and-a-half to three days from the west coast. Thus, containerized cargo and perishables can be moved intermodally by rail/water/truck or truck/rail or water/truck in a national "land bridge system" which connects the major internal and export-import break-bulk points of the Nation with world markets. This movement is significantly faster than by any one mode in isolation or deep water traverse through the Panama Canal. Such related moves have become a conventional opportunity, as Asian freight is brought to U.S. west coast ports, trucked to the midwest or east, then airlifted, barged, and/or deep-sea exported from the U.S. to Europe. This represents a very significant opportunity for the U.S. to become a major internodal cargo clearinghouse for world trade movements, in addition to enhancing its own export-import flow patterns. The presence of the I-66 Corridor would greatly improve tonnage across the ports of San Francisco, Oakland, and Long Beach, California and enhance the above clearinghouse effect in the midwest and at east coast and gulf ports.

There is a major set of population, although not metropolitan, which represents a series of significant population centers in rural America that can be linked together both economically and physically along the proposed I-66 route. Total 1986 population of the northern route option, terminating in Washington, DC, based on Bureau of Census reports, was approximately 12.4 million. Total 1986 population of the southern route option, terminating in Norfolk, Virginia, was approximately 10.3 million. For the northern route option, total 1986 income was estimated at $148 billion with an estimated average annual household income of $33,228. For the southern route option, total 1986 income is estimated at $99.1 billion with an estimated average household income per year of $27,274.

Finally, simple model analysis of the impact on the corridor of the proposed I-66 facility is underway through the development of multipliers. The economic impact of highway investment is the change in economic activity resulting from highway expenditures. Impact occurs because of shifts in economic activity amongst regions and because of increases in total activity in all regions. Specifically, the multipliers represent the amount of dollars generated per dollar of revenue in the basic industry. A multiplier takes into account the fact that various segments of the economy are interdependent and that not all dollars have ultimately the same impact on growth and change in the economy. Multipliers are being developed for business activity, household income, travel expenditures, and Government revenues. It is planned that future work will also include employment, property value losses and gains, and export multipliers.

Use of the above multipliers indicate that impacts that can be experienced during and after construction of the proposed I-66 facilities on counties within a 50 mile corridor are significant. Based on preliminary analysis, the northern route option of proposed I-66 is anticipated to experience an economic impact annually in excess of $303.7 billion and a one-time construction impact of $62.7 billion. The southern route option would experience an annual economic impact in excess of $281.5 billion and a one-time construction impact of $64.5 billion. This is truly a significant gain and illustrates the benefits of adequate highway corridors to GNP.

It is likely the requested feasibility study can be performed over a 12-month period, with a total cost estimated at $2 million. Each particular State department of transportation in the corridor will be requested to supply a matching $50,000 to $75,000 towards the feasibility study effort. The amount of Federal funds requested is $1.5 million. Design effort subsequent to a feasibility study would take some continual five years, with complete construction of the facility taking another fifteen to twenty years. The above timetable is ambitious, but reflects the urgency of provision of an infrastructure facility which has major positive national accessibility and economic impacts.

I would be most happy to answer any questions that you feel are germane at this time. We are continually undergoing revision of this document, and we will be happy to respond with further written documents in the future.

Mr. VALENTINE. Thank you, sir. Mr. Emerson, do you have any questions?

Mr. EMERSON. Mr. Chairman, I don't have any questions. I would just like to make the comment that I feel that as we look to the reauthorization of the Highway Act next year and to the highway transportation needs as we approach the next century, I feel that this concept, this idea does need to have a thorough feasibility study made of it. I think that Doctor Haefner has presented very cogently the reasons behind it; I won't be redundant in repeating them. I certainly want to urge the favorable consideration of this subcommittee for the feasibility study that is suggested here today.

Thank you, Mr. Chairman.

Mr. VALENTINE. Well, I am sure that the subcommittee and full committee will take this project under careful consideration. With the completion of the Interstate System over the last 40 years, the next big struggle will be to do what has to be done to put it back in first-class condition. There will be some questions raised, I'm sure as you would expect, as to whether or not the Federal Government should have a role in authorizing the funding of new segments of a transcontinental highway system.

We thank you very much for your presentation. I assure you that based on my knowledge of the members who represent the areas involved, that this matter will be aggressively and effectively pursued in the Congress.

Mr. HAEFNER. We thank you, Mr. Chairman.

[Mr. Haefner's prepared statement appears on page 1764.]

Mr. VALENTINE. All right. We now are pleased to welcome Mr. Philip W. Haseltine, Executive Director of the American Coalition

for Traffic Safety. Your statement will appear in the record as presented to us. We would thank you to please summarize.

TESTIMONY OF PHILIP W. HASELTINE, EXECUTIVE DIRECTOR, AMERICAN COALITION FOR TRAFFIC SAFETY, INC.

Mr. HASELTINE. Thank you, Mr. Chairman. Due to the hour, I most certainly will.

Our Nation has realized great progress in highway safety during the 1980s. Much of the credit for that progress goes to this committee and the leadership that has been so often demonstrated here. And during that last decade the fatality rate fell to the record low of 2.2 last year—and that's the lowest in the industrialized world—we saw five out of the ten years in that decade in which the number of people killed on our Nation's highways decreased to 45,500 last year.

A lot of things were responsible for those achievements, again many of which are the product of the earlier workings of this committee, starting with the Highway Safety Act which you enacted in 1986. But what we have seen recently is that we went from only one State having a Child Safety Seat law to all 50 States in the last decade; we saw 34 States enact safety belt use laws and belt use increased from 13 to 46 percent; we saw the number of States with 21 year old minimum drinking age laws increase from 13 to all 50; we saw a Nation become outraged with drunk driving and organizations like Mothers Against Drunk Drivers and incentives with sound drunk driving programs begin through legislation enacted by this committee.

But, despite that progress, as we are redrafting the Highway Safety Act, we have had a good decade behind us but we need to do a lot more. It is our belief that notwithstanding the past we ought to establish as a national objective the fewer than 40,000 annual traffic fatalities by the year 2000. That flies directly in the face of all the pundits. At the start of the 1980s, they were saying we were going to have 70,000 a year die; in 1990 we had 45,500. I see the current Secretary of Transportation in his transportation policy is now predicting 60,000 by early in the next century. None of that need be. We can achieve lower fatalities not just lower fatality rates, but it is going to require the utmost in planning, coordination, and utilization of all of our available resources to do so.

Let me summarize, Mr. Chairman, strictly by talking about the kinds of things that the Congress and that this committee can do to assist in the Nation's highway safety programs as you consider reauthorization of both the highway program and the NTSA programs that are funded as a component thereof.

First of all, we believe the Congress should consider incentive legislation to encourage States to enact safety belt use laws, (16 States still don't have them); to strengthen existing laws and promote compliance with child safety seat laws. We have those laws in all 50 States; about 80 percent of the people are using them but one-third of them are using them incorrectly.

Secondly, we think that Congress should seriously consider enacting legislation along the lines of the belt use legislation proposed by Representative Cooper to provide States with incentives to

enact motorcycle helmet laws. Again, we have many, many States that do not have motorcycle helmet laws; clear lifesavers, clear savers of dollars by State, local, and the Federal government as well.

Thirdly, we believe the Congress should continue programs to provide incentives to States having comprehensive drunk and drug driving programs—408 and 410 programs, perhaps with modifications along the lines that we heard suggested earlier.

Congress should provide modest funding increases for the State and Community Highway Safety Program, the 402 program, and to provide additional resources for NHTSA's occupant protection and alcohol countermeasures programs.

Those actions, which could be initiated in this committee, along with the continued cooperation of Government, the private sector, automobiles manufacturers, the many advances we are seeing in automotive engineering technology, indeed make a 40,000 annual death rate objective by the turn of the century something that is not unrealistic but something that is achievable.

Lastly, Mr. Chairman, I believe that the Congress should consider enacting legislation that would provide incentives for increased speed enforcement, particularly, but not exclusively, on those roads posted at 65 mph. One concept developed by this committee during the debate on the National Maximum Speed Limit a few years ago would have permitted States to raise speeds on selected roads if other stringent traffic safety measures—such as specified safety belt use levels or others—were in place. I think, Mr. Chairman, the time may be right to reexamine that proposal or something similar to it.

I think we do have a real opportunity to expand on the progress of the last decade and further reduce the number of Americans who die or are seriously injured on our highways each year. We would be pleased to work with the committee, Members of Congress, and the traffic safety community in general to help ensure that happens.

Thank you for the opportunity to appear before you today and I would be pleased to answer any questions you may have.

Mr. VALENTINE. Thank you, sir.

Besides the passage of laws, what do you think contributed most to the increase in the seatbelt usage and the decrease in drunk driving?

Mr. HASELTINE. With respect to safety belt usage, I think it was a combination of the laws themselves being enacted; enforcement of those laws. The States in general—although we don't see strong statistical relationship, there certainly is a positive statistical relationship—States that enforce those laws better seem to do better; and thirdly, as with any other law, a sound educational component. The combination of legislation, enforcement, and education I think is what has contributed to safety belt use increasing.

With drunk driving, I think the major gains that we have seen, unlike safety belt use, which kind of started with Government making policy action, on the drunk driving side it started with organizations like Mothers Against Drunk Drivers being formed and citizen outrage against drunk driving, which then precipitated action in the State Houses, precipitated action here in the Con-

gress. Again, it was the combination of Government, private sector citizens working together. In the case of the belts, much of the action began with the Government; on drunk driving, it began with citizens getting fed up with their friends and loved ones being killed by drunk drivers.

Mr. VALENTINE. Do you have there and could you read into the record the names of the States which do not have mandatory seat-belt statutes, and the States which do not require motorcyclists to wear helmets.

Mr. HASELTINE. Let me provide that for the record. I do not have the cycle data with me. The belt use I think I could do off the top of my head, but at the risk of missing one, if it would be permissible, I should prefer to provide that for the record.

MOTORCYCLE HELMET LAWS

State	Effective date	Application
Alabama	11/6/67	Helmets required for all riders
Alaska	1/1/71	Helmets required for persons under 18 and all passengers
Arizona	1/1/69	Helmets required for persons under 18
Arkansas	7/10/67	Helmets required for all riders
California	1/1/85	Helmets required for persons under 15 1/2
Colorado	7/1/69	No helmet law in effect
Connecticut	1/1/90	Helmets required for persons under 18
Delaware	1/1/68	Helmets required for persons under 19 and helmets must be carried on the motorcycle for persons 19 and older
District of Columbia	10/12/70	Helmets required for all riders
Florida	9/5/67	Helmets required for all riders
Georgia	8/31/66	Helmets required for all riders
Hawaii	5/1/68	Helmets required for persons under 18.
Idaho	1/1/68	Helmets required for persons under 18
Illinois	1/1/68	No helmet law in effect
Indiana	6/1/85	Helmets required for persons under 18

Iowa		No helmet law in effect
Kansas	7/1/67	Helmets required for persons under 18
Kentucky	7/1/68	Helmets required for all riders
Louisiana	1/1/82	Helmets required for all riders
Maine	7/3/80	Helmets required for all persons under 15
Maryland	9/1/68	Helmets required for all persons under 18
Massachusetts	2/27/67	Helmets required for all riders
Michigan	9/1/69	Helmets required for all riders
Minnesota	5/1/68	Helmets required for all persons under 18
Mississippi	3/28/74	Helmets required for all riders
Missouri	10/13/67	Helmets required for all riders
Montana	7/1/73	Helmets required for all persons under 18
Nebraska	1/1/89	Helmets required for all riders
Nevada	1/1/72	Helmets required for all riders
New Hampshire	9/3/67	Helmets required for all persons under 18
New Jersey	1/1/68	Helmets required for all riders
New Mexico	5/1/67	Helmets required for all persons under 18
New York	1/1/67	Helmets required for all riders
North Carolina	1/1/68	Helmets required for all riders

North Dakota	7/1/67	Helmets required for all persons under 18
Ohio	4/2/68	Helmets required for all persons under 18 and first year novices
Oklahoma	4/27/67	Helmets required for all persons under 21
Oregon	6/16/88	Helmets required for all riders
Pennsylvania	9/13/68	Helmets required for all riders
Rhode Island	6/30/67	Helmets required for all passengers
South Carolina	7/1/67	Helmets required for all persons 21 and under
South Dakota	7/1/67	Helmets required for all persons under 18
Tennessee	6/5/67	Helmets required for all riders
Texas	9/1/89	Helmets required for all riders
Utah	5/8/77	Helmets required for all persons under 18
Vermont	7/1/68	Helmets required for all riders
Virginia	1/1/71	Helmets required for all riders
Washington	6/8/90	Helmets required for all riders
West Virginia	5/21/71	Helmets required for all riders
Wisconsin	7/1/68	Helmets required for all persons under 18 and all persons holding learners' permits
Wyoming	5/25/73	Helmets required for all persons under 18

SUMMARY

Helmets NOT required - 3 States

Helmets required for passengers only - 1 State

Helmets required for persons under a specified age (usually 18) - 23 States

Helmets required for ALL riders - 23 States, D.C. and Puerto Rico

Mr. VALENTINE. Thank you, sir.

Mr. HASELTINE. You're welcome.

[Mr. Haseltine's prepared statement appears on page 1787.]

Mr. VALENTINE. Our next witness is Mr. David Snyder, Counsel, American Insurance Association. Welcome, sir. Your statement as presented to us will appear in the record. We would request that you please summarize.

TESTIMONY OF DAVID SNYDER, COUNSEL, AMERICAN INSURANCE ASSOCIATION, ACCOMPANIED BY PAT BARKDOLL, USF&G, AND MELISSA WOLFORD, AMERICAN INSURANCE ASSOCIATION

Mr. SNYDER. Thank you very much, Mr. Chairman, for the opportunity to be here today. Congress is to be commended, and particularly this subcommittee and the full committee, for the work that you have done on highway safety. Unfortunately, as we know from the statistics and the personal tragedies reported routinely, there is much yet to do. The overall answer to highway safety lies in working on driving behavior, on the safety of the vehicles themselves, and on the highways.

I am today here representing the American Insurance Association and our testimony is submitted on behalf of the three major national insurance trade associations. I am focusing today on commercial motor vehicle issues. I will also make a very few short comments about more general issues that have come up during the course of this hearing, and I will be brief on all scores.

Also with me today is Pat Barkdoll of USF&G, and Melissa Wolford with our Federal Affairs Office.

The insurance trade associations that I represent do write the majority of the commercial vehicle insurance in the country and the private passenger insurance as well. In looking at private passenger issues—we would urge, Mr. Chairman, the subcommittee to pay particular attention to the testimony provided by the Mayors, the cities, and the counties. The importance that they placed on reducing congestion on our highways is not only a matter of environmental protection, a matter of economic development, it is also a matter of helping us to contain automobile insurance rates because we have found repeatedly that where there is congestion, there is economic disruption, there is air pollution, and there are higher insurance rates as well.

Speaking and focusing though for a moment on commercial motor vehicles, we have seen that our losses have skyrocketed 73 percent in the past five years for liability pay-outs resulting from commercial automobile insurance. That means that while our efforts have borne some fruit, there is much that we have to do yet on the side of improving commercial motor vehicle safety. To begin with, we urge the subcommittee to continue its oversight of the commercial drivers' license program; that you reject any efforts to relax the deadlines placed on the States to bring themselves into compliance with the commercial drivers' license program.

Secondly, we urge that the Congress freeze truck lengths and weights at the present levels. Initial research has shown that doubles tend to be more dangerous. Furthermore, there is a very trou-

bling 1985 Federal Highway Administration report that raised serious questions about longer combination vehicles and about their performance on the highways. We frankly ought to be looking at what we can do to reduce our losses on the highways rather than those things that might increase them. So therefore we urge, because of the very troubling initial results in studies that have been done, that you freeze size and weights for commercial motor vehicles at their present levels.

Next, we urge the Congress to mandate better brakes on all trucks, specifically antilock breaks; and to place on-board recorders on vehicles. We believe that these on-board computers are the only way to effectively address the possible abuses of hours of service and the fatigue related accidents that the National Transportation Safety Board found were the leading cause of fatal accidents to truck drivers.

Insurers are doing their part on highway safety. We are funding a number of agencies that do research. Our rating systems both for commercial motor vehicles and for private passenger automobile insurance reflect safe driving behavior and reward it on a very rapid basis. But it is only the Congress, because of the involuntary insurance pools set up by the various States, which can assure a minimum level of safety both for four-wheel vehicles and also commercial motor vehicles.

In conclusion, we urge the Congress to stand firm on the deadlines in the Commercial Motor Vehicle Safety Act of 1986, and to continue oversight of the CDL program. We urge the Congress to hold the line on allowable commercial motor vehicle size and weight. We urge the House of Representatives to approve S. 819, which includes important provisions on antilock brakes, drug use, and improving the U.S. DOT's safety rating and enforcement program. Finally, we urge the Congress to consider mandating antilock breaks on new vehicles and on-board recorders on all commercial motor vehicles. In total, we think these measures will go a long way toward reducing the significant economic loss and the human tragedies that result from preventable commercial motor vehicle accidents.

Mr. Chairman, once again, I have appreciated the opportunity to be here today and would be pleased to answer any questions. I would ask for an opportunity some time later in your hearing process to address the broader areas of highway safety beyond commercial motor vehicles. Thank you.

Mr. MINETA. Thank you very much, Mr. Snyder.

Mr. Snyder, do you know why double bottoms are more likely to be involved in traffic accidents?

Mr. SNYDER. I would be pleased to provide the research on that for you. I think it relates to breaking, it relates to the stability of the vehicles, it relates to the mix of traffic on the highways, particularly the congested highways where the double bottom vehicles may be present.

[The information received from Mr. Snyder follows:]

AMERICAN INSURANCE ASSOCIATION
LAW DEPARTMENT

1130 Connecticut Ave., N.W.
Suite 1000
Washington, D.C. 20036
(202) 828-7100

April 27, 1990

The Honorable Norman Y. Mineta
Chairman, Subcommittee on
Surface Transportation
Committee on Public Works and
Transportation
United States House of
Representatives
Washington, DC 20515

Dear Chairman Mineta:

Thank you for the opportunity to testify on behalf of several insurance trade associations on the critical subject of highway safety in general and, specifically, commercial motor vehicle safety. At the conclusion of my oral statement, you asked several questions, in response to which I am pleased to provide the following information:

1. What is the basis for your statements that double tractor trailer combinations may be more dangerous than single?

Doctors Howard S. Stein and Ian S. Jones reviewed large truck crashes on the interstate system in Washington State and prepared a report published in the American Journal of Public Health entitled "Crash Involvement of Large Trucks by Configuration: A Case-Controlled Study" (May 1988). While a full copy of the article is enclosed, here are a few of the findings of the researchers:

"The present study has shown that doubles have a much higher crash frequency than other truck configurations. However, a net benefit might be realized if this increase in crash frequency could be offset by substantial decreases in truck traffic because doubles' greater cargo carrying capacity reduces total truck mileage. The National Research Council study of double trailers estimated that their increased use would reduce combination truck mileage by about 10%. This reduction in mileage clearly does not compensate for the up to threefold increase in crash involvement of doubles over tractor-trailers. ....When the crash involvement of doubles was compared to that of tractor-trailers operating under similar conditions, doubles were involved in crashes two to three times more often. If the use of doubles becomes more

DeROY C. THOMAS CHAIRMAN | WILSON H. TAYLOR CHAIRMAN ELECT | ROBERT J. HAUGH VICE CHAIRMAN | GEORGE W. ANSBRO VICE CHAIRMAN | ROBERT E. VAGLEY PRESIDENT

widespread throughout the interstate highway system and connecting roads, an inevitable result will be increased numbers of truck crashes."

Some of the reasons the report cites for the negative experience of doubles are: jackknifing, swaying and poor braking performance. Antilock brakes, which should be mandated on all trucks, may virtually eliminate jackknifing.

A Federal Highway Administration study (also enclosed) on longer combination vehicles (LCV's), entitled "The Feasibility of a Nationwide Network for Longer Combination Vehicles" (May 1985), raised profound safety questions with triples as they compare with even doubles, let alone singles. These problems include inadequate designs of current intersections, serious backing up, speed and stability problems, pavement damage, difficulties with maneuverability, and the probability of an emergency braking maneuver resulting in a jackknife. In addition, the report noted that LCV's provide potential for severely damaging overloads and that "extending operation of LCV's would substantially increase highway investment costs." These two studies together raise some very troubling questions that must be addressed to the satisfaction of the public before more authority is provided for doubles and triples to operate on the nation's highways.

2. What highway safety priorities do you recommend the Congress to consider?

Although substantial progress has been made on highway safety, current levels of deaths, injuries, property damage and related economic costs continue to pose a critical problem from both humanitarian and economic standpoints. We believe the most effective reponse is a comprehensive program to address all of the relevant factors--the driver, the vehicle, and the roadway.

The most important driver related efforts are antidrunk driving, speed limit enforcement, seat belt use, and Commercial Drivers' License programs. With respect to the vehicle, airbags should be mandated on all new cars, antilock brakes and on-board recorders installed on trucks and buses, side impact standards improved, and safety standards made applicable to all commonly used passenger vehicles (including small vans and trucks). With respect to the highway, we agree with The United States Conference of Mayors and the National League of Cities that congestion must relieved, through a combination of mass transit, new highway building and improvement of existing highways. Also, significant attention must be paid to preventive maintenance and signing (considering America's aging population). Meanwhile, research on new highway, auto and safety technology must be stepped up.

We would also like to address the question you raised during the hearing: to achieve fuel efficiency, is it necessary to downsize vehicles and thereby actually increase highway deaths, injuries and property damage?

Although small vehicles tend to do worse in crashes, both in terms of occupant protection and property damage, this need not be the case. For example, a 1981 Ford Escort with 5 mph bumpers withstood a series of crash tests without any damage, yet, a 1989 model with 2.5 mph bumpers resulted in $1,481 in damage. Some small cars sustained more than $3,000 in damage from low speed crash tests. Clearly, a 5 mph bumper standard established by the federal government would limit much of this damage to small and large cars alike.

With respect to occupant safety, it is critical that airbags start to appear widely in smaller, cheaper cars, as they have in larger, more expensive cars. Unfortunately, the trend has been to install automatic seat-belts, instead of the better airbags in smaller, cheaper cars. The United States Senate has explored an interesting incentive approach. Under language added to S.1224, a fuel efficiency credit would be provided to auto manufacturers for small cars which they equip with airbags. It is hoped this will give an effective incentive to the auto manufacturers to install airbags in smaller cars.

Thus, while many small cars on the current market sustain far too much damage and poorly protect occupants, neither of these negative results flows necessarily from the size of the car, but the way it is designed and used. Accordingly, we hope that the Congress can revisit the 5 mph bumper issue, to require better bumpers and to either provide incentives or regulations to bring about the installation of airbags in smaller, cheaper cars.

We appreciate the opportunity to work with the Subcommittee on the critical subject of highway authorization. We know that automobile insurance is a subject of major public interest for some members of the Congress from some parts of the country. According, we are anxious to work with the Congress to reduce the deaths, injuries and property damage in the first place, so that auto insurance rates, which pay for many of the costs of auto accidents, can be stabilized or reduced. Thank you.

Sincerely,

David F. Snyder

Crash Involvement of Large Trucks by Configuration: A Case-Control Study

HOWARD S. STEIN, MS, AND IAN S. JONES, PhD

Abstract: For a two-year period, large truck crashes on the interstate system in Washington State were investigated using a case-control method. For each large truck involved in a crash, three trucks were randomly selected for inspection from the traffic stream at the same time and place as the crash but one week later. The effects of truck and driver characteristics on crashes were assessed by comparing their relative frequency among the crash-involved and comparison sample trucks. Double trailer trucks were consistently overinvolved in crashes by a factor of two to three in both single and multiple vehicle crashes. Single unit trucks pulling trailers also were overinvolved. Doubles also had a higher frequency of jackknifing compared to tractor-trailers. The substantial overinvolvement of doubles in crashes was found regardless of driver age, hours of driving, cargo weight, or type of fleet. Younger drivers, long hours of driving, and operating empty trucks were also associated with higher crash involvement. (*Am J Public Health* 1988; 78:491–498.)

Introduction

Large trucks (10,000 lbs gross vehicle weight or greater) are a major safety problem on the nation's highway.[1,2] They are involved in about 6 per cent of all police-reported crashes but account for 12 per cent of all fatal crashes.[3] Each year, about 4,800 people die in truck crashes, and almost 75 per cent of these fatalities are to people in a vehicle other than the truck.[4] Trucks are overrepresented in severe crashes, but on a per-mile basis trucks appear to have fewer crashes than cars because they travel predominantly on interstate highways, which are low-risk roads.[1] However, when car and truck crashes are compared on similar roads, trucks have higher crash rates.[5] In recent years, both the number of crashes and the percentage of fatal crashes involving large trucks have been increasing.[6,7]

Although the involvement of large trucks in crashes has been extensively studied, little is known about the *relative* involvement of different truck configurations or the role played by factors such as load, type of cargo, or driver characteristics.[1,3] The influence of truck size, configuration, and weight has become an important issue because the 1982 Surface Transportation Act authorized the use of heavier, wider, and longer trucks and permitted double-trailer truck combinations to operate, on certain roads, in every state. Prior to the Act, 14 states had prohibited double trailers.[8]

The relative safety of double trailers has been an issue for some time; however, most studies that attempted to compare the crash rates of different truck configurations have used mileage estimates as measures of exposure to risk and were unable to adjust these estimates for the variation in travel patterns among different truck configurations. Because of these differences, the crash rates computed in many studies for doubles and tractor-trailers were not readily comparable.[9] The most reliable studies with more comparable exposure measures concluded that doubles had higher crash involvement rates than tractor-trailers.[8,10,11]

The potential problems in operating doubles are well documented in studies reporting significant handling problems related to the inherent instability of a second trailer.[12,13] Relatively small tractor steering movements (e.g., in a lane change maneuver) are magnified by the second trailer and can reach unmanageable levels, producing exaggerated sway and subsequent rollover of the rearmost trailer. The same steering maneuvers do not produce rollover in tractor-trailers. The increased trailer sway and rollover potential of doubles is also evident in crash data that indicate significantly higher proportions of rollover in fatal crashes involving double or triple combination vehicles.[14] Poor handling and stability were also reported in several driving studies and surveys of drivers,[15,17] which all concluded that driving doubles requires greater alertness and concentration than driving singles.

Nonetheless, there has been no reliable estimate of the overinvolvement of doubles in crashes relative to other truck configurations that is based on comparable exposure measures. Because doubles carry more volume than tractor-trailers, fewer are needed to transport a given amount of freight, and it has been claimed that this greater carrying capacity more than compensates for their potential overinvolvement in crashes.[8] Moreover, doubles are used on longer trips, travel more at night, are more likely to have been fully loaded, and have been used predominately in western states.[8] Other factors such as driver characteristics also may vary among truck types.

A research approach that can adjust for differences in exposure is the case-control method. The present study was designed to compare the vehicle and driver factors of large trucks involved in crashes with those of a comparison group on the interstate highway system in Washington State.

Method

Washington State has allowed a diversity of truck configurations including western doubles, Rocky Mountain doubles, and truck-trailers as well as tractor-trailers, tractors (bobtails), and single unit trucks to operate on all its roads (see Figure 1) for more than 25 years. The state provides a wide variety of climate and terrain ranging from the temperate coastal region through the Cascade Mountains to the desert areas in the eastern part of the state. Our study was conducted primarily on Interstate 5, which carries north-south traffic, and on Interstate 90, which has east-west traffic. Data were collected over a two-year period from June 1984 through July 1986.

Truck data were collected by the Commercial Vehicle Enforcement Section (CVES) of the Washington State Patrol. Approximately 100 officers are responsible for the weight enforcement and inspection programs in the state, which includes weigh stations on interstates and other major

FIGURE 1—Truck Configurations. NOTE: Western doubles were defined as a tractor with two trailer units with the first trailer 35 feet or less in length; nearly all had two 28 foot trailers. Rocky Mountain doubles were tractors hauling two trailers with the first trailer greater than 35 feet in length; the majority had a first trailer of 40 feet with second trailers of various lengths.

routes as well as port-of-entry weigh scales. The officers conduct detailed inspections of truck equipment including brakes, steering, tires, and other major systems. They also provide assistance to the Washington State Patrol in the investigation of truck crashes. Truck inspections followed the procedures detailed by the Commercial Vehicle Safety Alliance (CVSA) and the National Uniform Driver-Vehicle Inspection Manual.[19]

Study Design

The study included all crashes involving trucks with gross vehicle weight rating (GVWR) greater than 10,000 pounds that occurred on the interstate highway system (see Methods) and involved property damage of at least $1,500 or personal injury. Each crash-involved truck was inspected by a CVES officer to check the condition of the major truck components including brakes, steering, and tires. Where possible, quantitative measures of performance were used; for example, brake adjustment was measured from pushrod travel and tire condition from the tread depth. Truck weight, size, and configuration; driver age and experience; and the type of trip were also recorded.

One week after each crash, the CVES officers conducted a random roadside truck inspection at the crash location. For every crash-involved truck, three trucks were selected for the comparison sample: one approximately 30 minutes before the time of the crash, one at the time of the crash, and one 30 minutes later. The only criterion for selection of comparison sample trucks was that they have a gross vehicle weight rating of 10,000 pounds of greater. Because of safety and convenience considerations, the inspection site was usually at the next interchange, weigh scale, or rest area. Each comparison truck selected was inspected following the same procedures used for the crash-involved trucks. If the inspection was at the roadside, truck weights were obtained using portable scales or estimated from shipping papers. The inspection was typically completed within 30 minutes, which allowed the officers to select the next truck at the appropriate time.

This sampling procedure could not always be followed; some crash locations did not have sufficient area at the roadside to conduct an inspection or a convenient alternate site before the next interchange. In these cases, the inspection site was moved to an appropriate location as near the crash site as possible, and the inspecting officers confirmed that the selected truck had passed the crash location. Because of very severe weather or because the officers were investigating other crashes, a small number of the comparison sample inspections were conducted two or three weeks after the original crash. In addition, some comparison inspections were omitted because the crash had occurred in congested areas (e.g., downtown Seattle), where it was not possible to apply the sampling procedure satisfactorily. Crashes that occurred on ramps were not analyzed in this paper because of the difficulty and hazards of selecting comparison trucks. The study analyzed 676 crashes involving 734 large trucks that occurred between June 1984 and July 1986. Almost 85 per cent of the crash-involved trucks were successfully matched with sample trucks, and only these cases were used in the subsequent analyses of relative involvement.

Data Analysis

Truck configurations were classified as shown in Figure 1. The variables used in these analyses included truck configuration, age of driver, weight of load, hours of driving, truck body type, and fleet size (number of trucks operated by a given company). Variables with continuous ranges, such as driver age or hours of driving, were classified into three groups of equal size (i.e., low, medium, and high) based on the comparison sample. If a variable of interest was unknown for a crash-involved truck, then both crash and comparison trucks were excluded from the particular analysis. In the small number of cases (typically 3 per cent or less) where the value of a variable for one of the comparison trucks was unknown, a representative value was randomly assigned based on the distribution of this variable by truck configuration in the rest of the comparison sample.

To determine whether particular factors were overinvolved in the crash vehicles, contingency tables were constructed using the crash and comparison samples.[20] The statistical analyses were performed using the CATMOD procedure of the SAS Institute.[21] To present the effect of particular factors on crash involvement, involvement ratios were computed by dividing the percentage of trucks with that particular characteristic in the crash group by the percentage of trucks with the same characteristics in the comparison group. An involvement ratio greater than 1.0 indicated that the particular factor was overinvolved in the crash sample, and an involvement ratio of less than 1.0 indicated it was underinvolved.

Analyses were also performed stratifying the data by the study design parameters, which included crash type (single vehicle or multiple vehicle), day/night, route, and roadway alignment. In these analyses, the comparison sample was adjusted to include only those inspections corresponding to the specific parameter under study. For example, in analyzing the involvement of trucks in single vehicle crashes, the comparison sample included only those trucks sampled at the sites of single vehicle crashes. However, extraneous factors, such as weather, are randomly distributed throughout the sample of trucks, and it would have been inappropriate to match the cases by these factors.

To examine the simultaneous effects of the various study factors, a matched logistic regression model was used to estimate the adjusted odds ratio for each of the factors included in the model.[22] The odds ratio is the odds of crash involvement given a particular factor divided by the odds of crash involvement in the absence of that factor. To fit the model, the logistic regression procedure MCSTRAT from the

TABLE 1—Distribution of Crash-Involved Trucks and Control Sample Trucks by Configuration and Crash Type

Note that the involvement ratio bears a direct relationship to the odds ratio. If the crude odds are computed with respect to tractor-trailers, for example, the involvement ratios could be transformed to odds ratios by dividing each involvement ratio by the ratio for tractor-trailers.

With a case-control study of this type, it is only possible to compute *relative* involvements, which cannot be converted into crash rates. Consequently, these results cannot be directly compared to other studies that compute crash involvement rates on a per-miles-traveled basis. Also, because the crash-involved trucks were compared with randomly sampled trucks, if one value of a variable (e.g., a particular truck configuration) is overrepresented in the crash sample, some other values of the same variable must be underrepresented. By definition, every overinvolvement in the crash sample must be balanced by underinvolvement. Thus overinvolvements or underinvolvements are *relative* to the overall involvement of large trucks in crashes on the interstate highway system. Consequently, the results from this study cannot be compared directly with the crash involvement rates of other vehicles.

Results

Truck Configuration

Table 1 provides an overview of the data sets that were analyzed, and it shows the distributions of the crash-involved trucks and comparison sample trucks by configuration. Tractor-trailers were involved in 59 per cent of all crashes, doubles (including Western and Rocky Mountain doubles) in 21 per cent, truck-trailers in 9 per cent, and single unit trucks in 8 per cent. Corresponding figures for the comparison sample are 59 per cent tractor-trailers, 7 per cent doubles, 5 per cent truck-trailers, and 23 per cent single unit trucks. Thus, among large trucks, the crash experience of tractor-trailers parallels their exposure on the road, whereas doubles and truck-trailers are substantially overrepresented in the crash sample and single unit trucks are underrepresented.

Involvement ratios by truck configuration are given in Figures 2 and 3 for all single vehicle and multiple vehicle crashes, respectively. Compared to tractor-trailers, doubles were overinvolved in both types of crashes, although their overinvolvement was greatest in single vehicle crashes.

Although truck configuration plays a major role, crash involvement is affected by other factors. The factors of interest were separated into three major categories:

- truck operating characteristics (load, fleet size),
- driver characteristics (age, hours of service), and
- environmental/road conditions (day/night, curve/grade).

These various factors were analyzed in conjunction with truck configuration and the results are presented in Figures 4–7. Although many other factors affected crash involvement, truck configuration was the dominant effect and the other factors, in general, had less effect. Note that although all truck configurations were analyzed, only the results for the three configurations with the largest samples—single unit trucks, tractor-trailers, and doubles (Western and Rocky Mountain)—are presented.

Truck Operating Characteristics: Body Type, Load, and Fleet Size

Figure 4 gives crash involvement both by truck configuration (expressed as a percentage of the truck's GVWR), and by load. Compared to fully loaded trucks, empty trucks were overinvolved in crashes and partially loaded trucks were underinvolved. Load did not appear to have as large an effect for single unit trucks or tractor-trailers as for doubles. Doubles were overinvolved in all crashes, but empty doubles were move involved than partially or fully loaded doubles. An analysis of crash involvement by truck body type (i.e., van trailers, flatbeds, tankers, etc.) showed that no one particular body type was consistently overinvolved or underinvolved. Fleet size was not related to the crash involvement of tractor-trailers (Figure 5), but there was a trend of increasing involvement with decreasing fleet size for doubles and single unit trucks. However, irrespective of fleet size, doubles were always overinvolved in crashes.

Driver Characteristics: Age and Hours of Driving

Figure 6 gives the effect of driver age as a function of truck configuration. Compared to older drivers, young driv-

FIGURE 2—Involvement of Trucks in Single Vehicle Crashes by Truck Configuration

ers are significantly overinvolved in crashes independent of truck configuration. Just as important, the Figure also shows that doubles are overinvolved in crashes irrespective of the ages of their drivers.

Figure 7 shows the effect of hours of driving on crash involvement. Drivers with six or more hours driving prior to their crash were more involved in crashes than those with fewer hours. Single unit trucks and tractor-trailers were less affected by driving hours than were doubles. Doubles showed an overinvolvement that increased steadily as the number of driving hours increased. There was a particularly high crash involvement if the doubles' driver had been driving six or more hours.

Environmental and Road Conditions

The involvement ratios for daytime (daylight conditions including dusk and dawn) and nighttime (dark) crashes as a function of truck configuration are shown in Table 2. Doubles were overinvolved in crashes compared to tractor-trailers, but for all configurations nighttime involvement ratios were generally lower than daytime ratios.

Table 2 also shows that the involvement ratios for single unit trucks and doubles were greater on curves or grades than straight level roads but that the involvement ratios for tractor-trailers were lower on curves or grades.

The crash involvement ratios were comparable on Interstate 5 and Interstate 90. These ratios further confirm the basic finding that single unit trucks were underinvolved, and doubles were overinvolved in crashes relative to tractor-trailers, regardless of route.

TABLE 2—Truck Configuration Crash Involvement Ratios by Time of Day, Highway, and Roadway Alignment

Factor	Single Vehicle Crashes			Multiple Vehicle Crashes		
	Single Units	Tractor-Trailer	Doubles	Single Units	Tractor-Trailer	Doubles
Time of Day						
Day	0.6	0.8	4.9	0.4	1.1	2.9
Night	0.2	0.9	2.5	0.2	1.0	2.0

5	0.5	0.9	2.5	0.4	1.1	2.6
90	0.2	0.7	3.8	0.4	0.9	2.5

Relative Risk of Crash Involvement by Various Factors

The various two-way analyses that have been presented suggest the possibility of interaction effects although with the current sample size the effects could not be reliably assessed. To examine the simultaneous effects of these study factors (body type, load, fleet size, driver age, driving hours), a matched logistic regression model was used without interac-

FIGURE 4—Involvement of Trucks in Crashes by Truck Configuration and Load

tion terms. Table 3 gives the crude and adjusted odds of crash involvement by the various study factors. Truck configuration is the dominant effect; after adjusting for the other study factors, the relative crash risk for doubles was more than three times that for tractor-trailers. Type of carrier operation (interstate versus intrastate), driver age (<30), driving hours (>6), and load (empty versus full) all showed higher adjusted odds.

Table 4 gives the adjusted odds computed separately for single vehicle crashes and multiple vehicle crashes. For single vehicle crashes, the relative risk of crash involvement for doubles increased to 4.8 from 3.2 for all crashes. The odds for the driver age and carrier operation variables were similar, and those for load and driving hours were reduced. In multiple vehicle crashes, the adjusted odds for truck configuration, load, driver age, and carrier operation were about the same as for all crashes; however, the odds for driving hours (>6) were higher, suggesting a stronger relationship between hours of driving and overinvolvement in multiple vehicle crashes.

Trailer Stability: Rollover, Jackknifing, and Trailer Separation

Table 5 gives the frequency of rollover and jackknifing in single vehicle and multiple vehicle crashes as a function of truck configuration. Doubles were involved in a higher proportion of single vehicle crashes (49 per cent) compared with tractor-trailers (30 per cent). An obvious question is whether this occurred because the doubles configuration with the two trailers is more prone to rollover or jackknifing than

*Ratio of truck crash involvement percentage to comparison sample percentage.

FIGURE 5—Involvement of Trucks in Crashes by Truck Configuration and Fleet Size

FIGURE 6—Involvement of Trucks in Crashes by Truck Configuration and Driver Age

the tractor-trailer combination with one trailer. The proportion of rollover in single vehicle crashes was the same for doubles and tractor-trailers (about 45 per cent), but it was higher for truck-trailers and single unit trucks. The risk of injury was higher when rollover occurred; 49 per cent of single vehicle crashes with rollover involved injury, compared to 33 per cent without rollover. In multiple vehicle crashes truck-trailers, single unit trucks, and doubles all had a higher frequent of rollover than tractor-trailers.

Jackknifing of doubles occurred frequently in both single vehicle crashes (75 per cent) and multiple vehicle crashes (37 per cent). Truck-trailers jackknifed less frequently than doubles but more than tractor-trailers. In single vehicle crashes, jackknifing was almost twice as frequent on wet roads as on dry roads.

Table 5 also gives the frequency of trailer separation following a crash. Separation of units occurred in nearly 40 per cent of single vehicle crashes involving doubles and in 12 per cent of their multiple vehicle crashes; it was almost as frequent for truck-trailer crashes. Trailer separation generally occurred as a result of the crash although there are some cases reported where the separation of the second trailer precipitated the crash. Trailer separation was rare for tractor-trailers.

Discussion

Previous studies have documented the inherent stability problems of double trailer configurations.[12,13,15] The findings of this study suggest that trailer instability is one of the causes of the overinvolvement of doubles in crashes. Truck-trailers,

which have one coupling point less than doubles, were nevertheless overinvolved in crashes although less so than doubles. Similarly, tractor-trailers*[1] had a lower involvement than truck-trailers but were more involved in crashes than single unit trucks. The high crash involvement of empty doubles may reflect the fact that when doubles are lightly loaded sway problems are worse and their braking performance is also reduced.[8,16,24] Doubles were particularly overinvolved on curves.

*Tractor-trailers and truck-trailers both have one coupling point, but the fifth wheel connection of a tractor-trailer has more roll and yaw stability than the pintle hook arrangement used on truck-trailers.

**Reference group is given in parentheses; the odds ratios are computed within each group.

Although the proportion of rollover in single vehicle crashes was similar for doubles and tractor-trailers, the frequency of doubles in single vehicle crashes and thus their rollover frequency was much higher than for tractor-trailers. It was not possible to determine whether the high single vehicle crash involvement was the result of a tendency of the second trailer to rollover or whether rollover was the result of a loss of control crash. In nearly 40 per cent of single vehicle crashes involving doubles, trailer separation occurred. This high proportion of trailer separation has been noted by other researchers.[25]

The present study has shown that doubles have a much higher crash frequency than other truck configurations. However, a net benefit might be realized if this increase in crash frequency could be offset by substantial decreases in truck traffic because doubles' greater cargo carrying capacity reduces total truck mileage. The National Research Council study of double trailers estimated that their increased use would reduce combination truck mileage by about 10 per cent.[8] This reduction in mileage clearly does not compensate for the up to threefold increase in crash involvement of doubles over tractor-trailers.

The strength of the current results stems from the study design, which compared different truck configurations operating under similar conditions; this comparison is extremely difficult using conventional mileage-based methods. For example, a recent study used Fatal Accident Reporting System, Bureau of Motor Carrier Safety, and Truck Inventory Use Survey data to compute accident rates per 100 million miles of travel.[26] Unfortunately, that study suffers from the same data and method limitations as previous studies—rates for doubles and singles were not compared

TABLE 5—Frequency of Rollover, Jackknifing and Trailer Separation in Single Vehicle and Multiple Vehicle Crashes by Truck Configuration

**Includes all crash-involved trucks.

under similar conditions. The study concluded that overall crash involvement rates of the two configurations were similar but that 70 per cent of doubles crashes were on divided roads compared to 52 per cent of tractor-trailer crashes. However, the authors noted that per-mile crash rates are substantially lower on divided highways, thus "the accident picture is not quite as favorable to the current doubles as appears at first glance, since the doubles chiefly travel on relatively safe divided highways."

Although doubles have been operated in Washington State for more than 25 years, their crash involvement is much higher than that of other truck configurations. When the crash involvement of doubles was compared to that of tractor-trailers operating under similar conditions, doubles were involved in crashes two to three times more often. If the use of doubles becomes more widespread throughout the interstate highway system and connecting roads, an inevitable result will be increased numbers of truck crashes.

DEDICATION

This paper is dedicated to the memory of the late William Haddon, Jr, MD. Dr. Haddon was a pioneer in the field of injury control and used the case-control approach to study the contribution of alcohol to motor vehicle crash losses. Dr. Haddon was involved in the early stages of this project, and we feel he would be particularly pleased with our application of this technique to study the factors involved in truck crashes. We regret that he was unable to see this study through to its completion.

SUMMARY OF FINDINGS

BACKGROUND AND SCOPE

This is the final report of a study, mandated by Sections 138 and 415 of the Surface Transportation Assistance Act (STAA) of 1982, on the potential benefits and costs that could be anticipated from the establishment of a nationwide network for longer combination vehicles (LCVs). Impacts on shippers, rail and truck carriers and the general public have been considered. Estimates of freight volumes that would be carried by LCVs, the fuel savings, transportation cost savings and productivity, safety, pavement and bridge impacts, needed highway geometry improvements, and rail freight diversion are evaluated in the determination of network feasibility.

Vehicles considered in the study are Turnpike Doubles (a tractor-semitrailer-trailer combination vehicle with 40- to 48-foot trailers), Rocky Mountain Doubles (a vehicle with one 40- to 48-foot and one 26- to 28-foot trailer), and Triples (a vehicle with three 26- to 28-foot trailers). Vehicle weights are not limited to 80,000 pounds, but range up to the maximum for each configuration based on bridge overstress criteria roughly equivalent to the current statutory "Bridge Formula B" for lighter vehicles.

Highways considered for inclusion in the study network include the Interstate System and a few other highways that are of similar design as well as of significant length. Several approaches to local access have been considered, including establishing staging areas, using access zones, or limiting off-network travel to selected roads that can safely accommodate LCVs.

Many sources of information were used in the study. Existing Bureau of the Census, Department of Transportation (DOT), and Bureau of Labor Statistics data bases were used extensively to obtain information about the current truck fleet, its productivity, and its travel. Information supplied by motor carrier and shipping groups was important in estimating potential use of LCVs and in assessing the safety records of various truck configurations. The American Association of State Highway and Transportation Officials and its member State agencies supplied important information regarding highway adequacy and costs to upgrade facilities. The Federal Highway Administration data bases supplemented case information provided by States and provided additional general

descriptions of highway system components. Traditional freight forecasting methods were incorporated into a comprehensive model developed by DOT's Transportation Systems Center that is being used to assess transportation effects of establishing an LCV network.

Information on longer combination vehicle use was also gathered from other countries, mainly Canada and Australia. European use of such vehicles is limited.

FINDINGS

Review of the issues shows a broad range of impacts associated with a network for longer combination commercial vehicles. Following are the most important findings of the study.

LCV Configurations in Use and Parameters Defining the Vehicles for the Study

- Turnpike Doubles are used on many Eastern turnpikes and generally consist of two 40-to-45-foot trailers, but may eventually consist of twin 48-foot trailers when such trailers become more prevalent.

- Rocky Mountain Doubles are allowed chiefly in the Rocky Mountain States and consist usually of one 45-foot and one 27-foot trailer, but may move toward a 48-foot and a 28-foot trailer.

- Triples are allowed on selected highways in a half-dozen Western States and consist generally of 27-to-28-foot trailers.

- Allowing weights to be controlled as indicated in Sections 138 and 415 only by existing axle load limits and the current Bridge Formula could result in vehicle weights exceeding 200,000 pounds, which would severely overload existing highway bridges.

- Basing the allowable weight on an additional criterion of bridge overstress would result in the heaviest LCVs reaching 131,000 pounds without overstressing simple-span bridges any more than some existing 80,000-pound vehicles.

- Because some span lengths and bridge types are subject to more overstress by LCVs than others, a bridge-by-bridge analysis is needed on each potential LCV route to determine whether an LCV can be safely accommodated.

LCV Regulations

- Current Federal regulations preclude the use of LCVs weighing more than 80,000 pounds on the Interstate System (except in States with grandfather rights), but do not control weights off the Interstate System.

- There are also Federal regulations that apply to the safe operation of freight vehicles operating in interstate commerce, including LCVs.

- Where LCVs are allowed by States and turnpike authorities, it is almost always only under special permit.

- Most States and turnpike authorities require LCVs to meet certain performance (e.g., acceleration and braking) standards and many require special driver certification.

LCV Performance

- Performance of the LCV configuration varies, as indicated in Table 5-1.

- Few nonfreeway street intersections could realistically be modified to accommodate Turnpike Doubles and although modification could be considered for the Interstate System most interchanges would have to be upgraded to accommodate them.

- Triples can maneuver on most roads traversable by a combination vehicle with a 48-foot semitrailer, although a substantial number of interchanges need to be modified to accommodate either vehicle.

- LCVs operating at heavy weights need high-power engines to maintain speed on grades and thus avoid creating traffic operation problems or safety hazards.

TABLE S-1

LONGER COMBINATION VEHICLE DIFFERENCES

	Rocky Mountain Double	Turnpike Double	Triple
Offtracking	◐	●	○
Backing-up	●	●	●
Stability	◐	○	●
Acceleration	◐	●	●
Maintaining Speed	◐	●	●
Splash and Spray	○	○	○
Overweight Potential	◐	●	◐
Pavement Damage	◐	*	●
Productivity	*	*	*
Trailer Sway	◐	○	●
Fuel Consumption	*	*	*

LEGEND:

* = Better than a 45- to 48-foot semitrailer

○ = Equivalent to a 45- to 48-foot semitrailer.

◐ = Somewhat worse than a 45- to 48-foot semitrailer.

● = Much worse than a 45- to 48-foot semitrailer.

- [redacted] downgrades is less effective for LCVs than for other [redacted] because [redacted] ratio of [redacted] vehicle weight.

- LCV braking capacity is potentially better because they have more axles and therefore more braking power per pound of cargo carried. Axle loads are lighter, however, and given LCVs length and the tendency of truck brakes to be out of adjustment and imbalanced, the probability of an emergency braking maneuver resulting in a jackknife would be increased.

- Triples have a greater potential than existing conventional vehicles to sway and to amplify rapid turning movements. Trailer sway can be alleviated somewhat with carefully maintained, special equipment.

- LCVs with more than two articulation points cannot be reliably backed up more than a few feet.

- Difficulties with lane changing and other operations by LCVs on congested roadways indicate a need for careful evaluation of times that such vehicles should be allowed on each route or places on a route where certain actions, such as passing, can take place.

- A medium length tandem axle double with less offtracking than a Turnpike Double but greater stability than a Western Double should be investigated further.

LCV Safety

- LCVs currently operated have very low accident rates, but this safety record cannot necessarily be extrapolated because of the special conditions that govern their operations.

- Performance and handling limitations of LCVs, as well as their higher gross weights, could prove to create significant safety problems if LCVs are used more generally, such as under a greater variety of road, environmental, and traffic conditions.

- An LCV network limited to Interstate highway links would divert some freight to these relatively safer highways from lower-level roadways and thus could decrease accident rates on the lower-level roadways.

- A given amount of highway travel by LCVs can move more freight than the same amount of travel by conventional vehicles and thus accident rates per ton mile could be reduced if current LCV accident rates did not worsen.

- We simply do not know whether LCVs can be operated safely in general use.

LCV Network Characteristics and Considerations

- Each potential LCV route should be analyzed segment-by-segment to determine whether LCVs could be safely operated.

- Inclusion or exclusion of particular Interstate routes from an LCV network could have an impact on local economies and specific motor carriers.

- While most Interstate mileage meets high geometric standards and is relatively uncongested, route selection based on such engineering criteria alone would result in a discontinuous network that would fail to connect major U.S. market areas.

- Mountainous terrain and urban areas are primary locations of geometric or capacity deficiencies on the Interstate System.

- Pavement condition, interchange spacing and geometrics, availability of services, bridge characteristics, lane widths, curves and grades, and traffic levels all must be considered when assessing the suitability of a particular highway route for LCV network inclusion.

- Local access could be handled via staging areas, access zones at selected interchanges, or specific, case-by-case inclusions of nonfreeway routes. Each of these has major consequences on operators of LCVs.

LCV Costs and Productivity

- Use of LCVs would allow a given amount of freight to be moved with fewer driver-hours and vehicle trips, with less fuel, and at lower total cost.

- The more extensive the network and the greater the local access, the higher are potential benefits and the proportion of freight that would be carried by LCVs.

- The ability of individual motor carriers to benefit from an LCV network varies widely, depending on carrier proximity to the LCV network and type of operations.

- Given the current competitive status of motor freight transportation, some of the transportation cost savings would be passed on to shippers and consumers.

Modal Diversion by LCVs

- Freight could be diverted from rail to truck if there were an LCV network, and the diverted freight would come disproportionately from high-revenue-producing freight categories.

- Rail corridors and freight categories would be affected unequally. Railroads could be expected to adjust some rates downward to limit diversion in affected corridors.

- Diversion would result in the need to spread fixed costs over a smaller traffic base, potentially resulting in higher rates for some shippers.

- Net revenues of some rail carriers could be substantially reduced due to competitive rate reductions and traffic diversions.

- When the Nation's transportation system is considered as a total entity, diversion away from rail would reduce the total transportation productivity and fuel consumption gains made by LCVs.

Roadway Costs Produced by LCVs

- LCVs with weight limited by overstress criteria will not overstress bridges more than the shortest, heaviest vehicles now allowed but will still decrease service lives of some bridges by increasing frequency of overstress.

- Costs of providing staging areas or, alternatively, of rebuilding interchanges to allow partial access off the network could be substantial. These costs are highly dependent on the access policies that are adopted. Such costs are necessary to some degree just to accommodate 48-foot semitrailer combinations, but would be much higher with twin 48s.

- Costs of upgrading interchanges must be borne by someone at the outset in order to allow the greater use of LCVs. The private sector could directly finance many types of improvements.

- The higher capacities of LCVs provide a potential for severely damaging overloads and call for much stricter weight enforcement and more severe penalties for overloads.

UNRESOLVED ISSUES ASSOCIATED WITH AN LCV NETWORK

- There is no compelling reason for designation of a federally mandated LCV network at this time. The States are currently providing opportunities for controlled use of LCVs.

- There are positive aspects of LCV use, but many unresolved issues argue against their immediate widespread use.

- Federal regulations currently permit LCVs at the discretion of States, but limit their desirability by restricting gross weights on Interstate highway in most states to 80,000 pounds.

- Permits and many other special driver and vehicle regulations used by States to control LCV use would be difficult to adapt to a national network.

- Enforcement of weight and other operating regulations is an important part of allowing larger vehicles and a plan for more effective enforcement would be needed if more widespread use of LCVs were allowed.

- FHWA experience in designating a nationwide network for STAA vehicles revealed a myriad of local considerations that would apply with equal validity in designating an LCV network. A more complete understanding of these considerations, with respect to the network already designated, is required.

- Local access is potentially the most troubling aspect of network designation. More analysis of tradeoffs between staging areas and allowances for leaving the network is needed.

- Any network designation plan would need the total cooperation and heavy involvement of State departments of transportation.

XL - Extending operation of LCVs would substantially increase highway investment costs. Since LCVs would not come close to paying their share of highway costs under current user fees, extending their operation without a substantial increase in user fees would unfairly subsidize them at the expense of other highway users and other freight transportation modes. Two recently begun studies, mandated by the Deficit Reduction Act, will report on user fees for heavy vehicles.

X - LCVs vary widely in their performance, handling, pavement damage, and other characteristics and must be considered separately in assessing the desirability of any LCV.

- Heavy gross weights of vehicles, as long as they are controlled to limit bridge stress, are not as damaging to highways as heavy axle weights. Some way to encourage lower axle weights is needed to ease anticipated pavement rehabilitation costs.

Mr. MINETA. I would also like to ask you if you could identify the study that found that one-third of the truck drivers are under the influence of drugs or alcohol or both. I am wondering really how comprehensive that study was in terms of a National trend.

Mr. SNYDER. That's the National Transportation Safety Board's study that was released approximately a month ago. It found that nearly one-third of the fatal truck accidents—that is accidents fatal to truck drivers—involved drivers who were under the influence of drugs, alcohol, or both. In addition, it found nearly the same percentage, actually a slightly higher percentage, where fatigue may have been a contributing factor. And one of the points that we wish to emphasize today is that automatic on-board recorders may be the only real solution to fatigue resulting from violations of hours of service of commercial motor vehicle operators.

Mr. MINETA. In terms of automobile safety, what programs have you found to be the most effective in reducing fatalities and injuries?

Mr. SNYDER. Mr. Chairman, a comprehensive approach that addresses driving behavior, that addresses the safety of the vehicles themselves, and that addresses the configuration and the congestion on the highways is the kind of program that will ultimately work. With respect to driving behavior, we think critical have been the efforts to improve seatbelt use, efforts to crack down on drunk driving, and the commercial drivers' license program which States are putting into effect.

With respect to the safety of vehicles, there is no question that air bags ought to be in every new automobile as soon as possible, and that the presence of air bags is already starting to pay off. We also think that the damageability of vehicles is something that has to be looked at for small vehicles, in particular. Fender benders at very low speeds cause unnecessary damage and 5 mph bumper crash resistant standards ought to be required.

Finally, with respect to the highways, we think that the major issue there is congestion. We see time and time again that auto insurance rates are tracking where the congestion on the highways is. For that reason, we think the earlier testimony today of the Mayors, the cities, and the counties on a highway policy that attacks congestion would bear a lot of rewards for the United States.

Mr. MINETA. Thank you very much, Mr. Snyder for your testimony here today.

Mr. SNYDER. Thank you, Mr. Chairman.

[Mr. Snyder's prepared statement appears on page 1924.]

Mr. MINETA. Now we would like to call on Fraydun Manocherian, the President of The Manocherian Foundation. Mr. Manocherian, your statement will be made a part of the record. We are pleased to have you here. If you would go ahead and proceed in your own fashion, sir.

TESTIMONY OF FRAYDUN MANOCHERIAN, PRESIDENT, THE MANOCHERIAN FOUNDATION

Mr. MANOCHERIAN. Thank you, Mr. Chairman. I am Fraydun Manocherian, founder and President of the Manocherian Foundation. This foundation has pursued safety on our highways for the

past three decades. It is a commitment and purpose of my life to do what I can do to reduce this major cause of grief and injustice in our country.

The first time I personally testified before a body of Congress was two decades ago. I believe I was among the first to bring the severity of the problem of alcohol abuse on our highways to your attention.

Since then, thanks to actions by Congress, the Department of Transportation, and many private groups, we have been able to reduce deaths per 100 million miles driven from 3.3 in 1979 to 2.2 in 1989. An impressive achievement of one-third reduction in deaths per 100 million miles driven.

In spite of this reduction, over 47,000 Americans died on our Nation's highways in 1988—a number of approximating the deaths that we suffered in all ten years of the Viet Nam war. The fact is, a lot more can be done and it is the responsibility of you, the leaders, to take such steps as necessary to reduce further this continuous carnage.

Auto accidents are the number one cause of death among Americans up to the age of 34, and probably the number one cause of tragedy and grief in this country. Aside from death and injuries, highway accidents cost the American public $75 billion each year.

It is our contention that a national driver education program conducted principally on the national television and radio would reduce accidents substantially.

It is established fact that the driver is the cause of 90 percent of auto accidents. Despite these findings, Federal programs concentrate on improving the car, which we agree should be made safer, and on the road, which we also agree is imperative for safety. Our concern lies with the lack of attention given to the driver and the role his lack of good judgment and incompetence plays in 6.8 million annually.

While drunk driving is responsible for 50 percent of the fatalities, only 9 percent of all accidents are alcohol-related. Therefore, 91 percent of accidents that cause the other 50 percent of fatalities are virtually ignored. These findings demonstrate that driver judgment and everyday behavior are the most critical factors in accidents.

The proposed new media campaign would focus on the prevalent causes of highway accidents with concentration on alcohol and drug abuse. These would include driver inattentiveness, such as taking your eyes off the road; tailgating; dozing off at the wheel; as well as educating the public how to address road hazards, such as skidding and blow outs.

Mr. Chairman, if I may get away from the text just to bring a point that you had brought up in previous testimonies, you were discussing small cars versus larger cars and the safety factor, which is absolutely correct—the possibility of death in an accident in a small car is much larger. However, taking your own Sherman tank example, if you do wear a helmet in a Sherman tank but you take your eyes off the road and go off a cliff, you get killed. Therefore, the competence and the points of driver safety are imperative.

In summary, the program we propose would be geared to improve driver competence, judgment, and knowledge of laws and regulations.

While it is known that driver education at least temporarily reduces the incidents of accidents, only a small portion of America's 158 million drivers receives formal training. From 1983 to 1987, the percentage of the Nation's public and private schools offering driver education declined 14 percent. Also, driver education programs do not address non-driving citizens and children. Educating them through the media could reduce the 7,000 annual pedestrian deaths.

Such a campaign, centered on national television and radio advertising, must contain three critical elements—it must be continuous; it must be aired in specified times to target specific audiences; it must utilize state-of-the-art production values.

It has been proved that all knowledge attained in driver education courses does not remain with the individual indefinitely. Typically, that education comes at the age of 16 and one out of every five drivers today is over 60 years old. More reason why continuous education is a must.

Again, Mr. Chairman, if I may get away from the text. In airlines, the Transportation Department requires that most competent airline pilots be retrained every six months. Yet, when it comes to driving that can kill you just like an airplane crash, we don't have any retesting of a person who could be 93 years old and driving.

A truly effective campaign cannot rely on PSAs only, as has been the case. Rather, it must be augmented with a substantial paid advertising budget, such as that used by major U.S. corporations.

Mr. Chairman, this is really the $64 question. To fund this program, we propose the use of less than 1 percent of the Highway Trust Fund. Safety on our highways is directly related to highway use.

The 1 percent allocation of the Highway Trust Fund would empower the Department of Transportation with an additional $150 million annually to use for the purposes outlined. This expenditure—which approximates the national advertising budget of General Motors—even if only 1 percent effective in reducing accidents, would save Americans $750 million, five times the investment, and considerable life and limb.

The estimate by many experts, including people in the Department of Transportation, have gone as high as a 15 percent reduction in accidents with cumulative effect. A 15 percent reduction, if achieved in time, would save over $11 billion, spare over 7,000 lives, and eliminate injuries to 500,000 people annually.

The auto accident, the number one disabler of all Americans, takes a life every 11 minutes around the clock. In America, we are innocent until proven guilty. We spend millions of dollars to prove someone's guilt beyond a shadow of a doubt so an innocent is not wrongfully punished. Yet, on our highways, many innocent men, women, and children are becoming paraplegic, quadriplegic, blinded, brain damaged, and killed daily. This problem can be helped, and you can do something about it. For the sake of justice for inno-

cent victims who can be you, me, or our loved ones, we ask that you consider this proposal carefully.

In this proposal, we are not asking for any new expenditure on the part of the public or the Government. The question at hand is that if we an save lives, reduce injuries, eliminate much grief, and ultimately save billions of dollars, shouldn't we? If the answer is yes, we ask you to act now to reduce the number one cause of injustice and grief in America.

Thank you, Mr. Chairman.

Mr. MINETA. Mr. Manocherian, thank you very much for your very thoughtful statement.

The study conducted by both the National Highway Traffic Safety Administration (NHTSA) and the Insurance Institute for Highway Safety have indicated that high school driver education programs have shown no reduction in fatalities of younger drivers; and, in fact, in some of those States where driver education is required, there has been some increase in fatalities in that age group. It is believed that one reason for this phenomenon is that driver's ed encourages earlier licensure. You have indicated that a national driver education program conducted principally on national radio and television would reduce accidents substantially. I am wondering as I read your statement and then I see these studies by NHTSA and the Insurance Institute——

Mr. MANOCHERIAN. Mr. Chairman, you may have answered the question yourself—the younger driver coming on stream may be one of the problems. But I know of a very major study that was done two decades ago or more where 500,000 armed forces people were given driver education, after which the incidents of accidents and fatalities were cut by 50 percent. However, with time, that decrease in accidents faded away. Much that we learn, I guess if we don't keep up with it, we will lose it.

Now this is really a question where I feel that if you had a more competent behind the wheel or a more competent pilot, wouldn't you have a better chance of reaching your destination, Mr. Chairman? For example, people get licenses today who haven't got the slightest idea what to do in case of a skid. If audio-visually this could be shown, you would definitely get somewhere with it, or if you were able to tell people that a bridge freezes before the road would. Now how that could possibly increase incidents of accidents or fatalities, I couldn't really understand. But I can tell you that in my opinion and in the research that we have done in the 30 years that we have been involved in safety, we find that when you have more competent people behind the wheel, it is the best way you can assure safety.

Mr. MINETA. Was it last fall when there was a driver education program that was on national television?

Mr. MANOCHERIAN. It was several years ago, I believe.

Mr. MINETA. Has it been that long?

Mr. MANOCHERIAN. Yes, sir. Time goes.

Mr. MINETA. I didn't realize it was that long ago, but I remember it. I think through the newspapers they had distributed some kind of a booklet that you would follow the program. I think it was sort of interesting to do it. I know I waited for that time just to do the exam.

Mr. MANOCHERIAN. Many failed I believe, if you recall the results of that exam.

Mr. MINETA. I was just reminded that it was done by the Ashland Oil Company people, the Valvoline people had done that on national television.

Mr. MANOCHERIAN. Yes, I think CBS or one of the networks also.

Mr. MINETA. Right, I believe they carried it on one of the major networks. I remember having the brochure and answering those questions.

Mr. Manocherian, NHTSA has, at the behest of Congress, undertaken five pilot projects to determine the effectiveness of public information programs. The agency found that the most effective ad campaigns were those that were combined with comprehensive programs addressing the specific driving behavior. You were talking about how many people knowing about the bridge freezing up before the road. I am wondering if you are familiar with this study and whether or not you have had a chance to make any kind of an assessment of that study?

Mr. MANOCHERIAN. I am in touch with the Transportation Department and I do also know that in 1982 seatbelt use was somewhere around 11 percent; in 1988 it was 47 percent Nationwide. Now, certainly, the law enforcement had a lot to do with that, but I think that the public education also played a major part. According to previous testimony, we found that has been a very effective way of saving lives. That is why a one-third reduction in the last decade has been achieved.

The anti-drinking ad campaign done by the Transportation Department I believe has brought a lot of consciousness into not only the public but also the law enforcement officials as well as the judges. Today, you have approximately 2,000 arrests compared to 500 arrests of drunken drivers.

Mr. MINETA. The terms of this 1 percent set aside that you are envisioning, why do you think that the dedication— again, following up on what you just said—why do you think that the dedication of a penny or some increment of the Highway Trust Fund for a paid advertising campaign to reduce highway fatalities and injuries would be more effective than increasing funding for other safety programs, let's say in design and engineering of roads, whatever it might be, and that any of those safety programs might include public information as part of its criteria?

Mr. MANOCHERIAN. Mr. Chairman, at this particular time, the Highway Trust Fund, which comes into many billions, is being used for highways, better highways, more highways, and safer highways, which we absolutely agree with. The road plays a part, making cars safer plays a part, law enforcement plays a part, but it is our contention that the driver is ultimately 90 percent the cause of the accident. The ultimate accident is in the hands of the driver, his judgement, his competence. Drinking and driving is a part of the judgment of the driver also when you think about it. So we are thinking about trying not to let the accident happen in the first place. Restraint systems are fantastic, they have saved many lives and they will save many more. The air bag system will save a lot of lives. But that is after the accident occurs. What is going to keep the accident from happening in the first place is the driver.

Mr. MINETA. Smart highways, smart vehicles, smart drivers——

Mr. MANOCHERIAN. All of these things are going to aid and help, as they have in the past. But I am of the opinion and conviction, after thirty years involvement in auto safety, that the most important criteria for safety is the person behind the wheel.

Mr. MINETA. The loose nut behind the wheel.

Thank you very much, Mr. Manocherian. We appreciate it very much.

Mr. MANOCHERIAN. Thank you, Mr. Chairman. I appreciate the privilege to be before you today.

[Mr. Manocherian's prepared statement appears on page 1805.]

Mr. MINETA. I would now like to call on Mr. Edward R. Book, President of the Travel Industry Association of America, and Vice Chairman of the Travel and Tourism Government Affairs Council. I believe Mr. Book will be accompanied by Aubrey C. King, Executive Director. Welcome, gentlemen. Your statement as presented to the committee will be made a part of the record, and you may proceed in your own fashion.

TESTIMONY OF EDWARD R. BOOK, PRESIDENT, TRAVEL INDUSTRY ASSOCIATION OF AMERICA, AND VICE CHAIRMAN, TRAVEL AND TOURISM GOVERNMENT AFFAIRS COUNCIL, ACCOMPANIED BY AUBREY C. KING, EXECUTIVE DIRECTOR

Mr. BOOK. Thank you, Mr. Chairman, for this opportunity to present the views of the travel and tourism industry on the reauthorization of the Federal Highway Program.

My name is Edward R. Book and I am President of the Travel Industry Association of America (TIA), the national trade association which represents the whole of the Nation's travel industry. I also serve as Vice Chairman of the Travel and Tourism Government Affairs Council, an affiliate of TIA, which is a permanent coalition of 33 national organizations from every segment of the travel and tourism industry. It is on behalf of the Government Affairs Council that I appear before you today.

The deliberations of this subcommittee and the decisions it reaches concerning the future of the Federal Highway program will have a profound impact on the travel and tourism industry.

Over the past decade, employment in travel and tourism has grown at more than twice the rate of all U.S. industries. So many States and industries rely on travel and tourism as a key component of their economic development efforts, it has become either the first, second, or third largest employer in 37 of our 50 States. Approximately 80 percent of vacation travelling is done by highway, amounting to more than 321 billion in 1988. More than $225 billion is spent along the way. So, as you can see, our highway system is very much a part of producing a substantial amount of income for our country.

Our international visitors also find the American road appealing. Approximately 50 percent of them typically use a car for at least a part of their stay.

The impact on the average U.S. community of increased vacation traffic can be dramatic. One hundred additional visitors a day will generate $1.3 million in sales, $280,000 in payroll, and 29 new jobs.

Yet American highways are increasingly aging and congested, more often frustrating and discouraging travellers than offering the lure of the open road. We therefore offer the following recommendations. Let me outline them briefly.

One, the existing Federal Surface Transportation Program should be continued and expanded. The Interstate System should be completed and maintained by the highest standards. Federal support should also target other roads and highways of national or interregional significance. Enhanced metropolitan mobility should get special priority.

Two, our country needs more timely and fuller expenditure of user tax revenues collected for the Highway Trust Fund. It is imperative that the $18 billion surplus in the Highway and Transit Trust Fund be fully used for the purposes for which it was collected. By using this surplus as intended, it should be possible to develop new initiatives and expand current programs without increasing Federal taxes for several years.

Three, Federal gas tax revenue should continue to be dedicated exclusively to the highway program. We applaud the leadership of the full committee and this subcommittee in staunchly opposing proposals to use the gas tax for non- transportation purposes.

Four, we support increased capital investment in highway safety. Federal aid funds should be available to ensure the safety of all highway bridges and to eliminate significant roadside hazards.

Five, we support Federal research, development and training efforts to maximize use of the best available highway technology.

Six, we support a National Scenic Byways Program. With the benefits of America's great scenic and historic byways as a guide, it is time for a national program which would rely on State initiative to design and maintain such byways while making them eligible for appropriate Federal assistance, including technical and marketing support. Byways under the control of the Federal land agencies should be eligible for Federal highway funds for construction and maintenance. A Federal Office of Scenic Byways could provide State technical support and marketing assistance and Federal agency coordination. This offers an opportunity to support rural tourism initiatives to supply new jobs to the less populated areas of our country.

Seven, improved transportation information systems will facilitate convenient, efficient, and safe travel. As travellers are older or less likely to have English as their native language, it is necessary to improve the availability and clarity of highway information. Private sector messages need to be supplemented and improved by standardized signage. Technological advances and Federal support for the construction and maintenance of State information or welcome centers should be utilized.

In conclusion, these policies and programs will enable our Nation to accomplish the essential rebuilding and expansion of our national surface transportation infrastructure. Surely, we can do no less.

The travel and tourism industry looks forward to working with the subcommittee as it strives to complete this monumental task.

Thank you very much.

Mr. MINETA. Thank you very much, Mr. Book. Those statistics that you have outlined are just really eye openers. I am just won-

dering as travel delays occur in urban areas because of congestion on our Nation's highways, will the decision to take alternative modes of transportation adversely affect the travel and tourism industry?

Mr. BOOK. I think unquestionably that the gridlock syndrome we are experiencing in some of the major urban areas will become a deterrent to travel in our country. It could have a very measurable negative effect on the growth of our industry. There are areas of the country now, as you are well aware, that have six to eight hours of gridlock per day. The international visitor does not expect that type of problem when he arrives in this country and it can become a deterrent.

Mr. KING. I might add, Mr. Chairman, you will see in our more detailed testimony that the American Automobile Association has begun an annual survey of vacation travellers to try to get some assessment as to where they are going and why. Last year, in 1989, they determined that 9 percent of this scientifically constructed sample that they questioned indicated they were not taking a vacation trip by car specifically because of their concerns over congestion. Another 4 percent indicated that they were going to change the ultimate destination for their vacation.

Mr. BOOK. I was thinking earlier that we have built a very good Interstate system to take us from cities A, B, C, D, on whatever route you want to take in terms of intercity travel through the Interstate program. But once we get you to city A, or city B, or city D, you are on your own. And then because of that gridlock within the city A, or B, or C, or D, we then use Federal funds to build beltways. Then the local community takes advantage of the beltway to help their own local folks to commute, and thereby adds more to the gridlock. We just never seem to be able to get out of that trap we keep building for ourselves.

Mr. MINETA. Well, Mr. Book, in your statement you indicate that metropolitan area mobility should receive particular attention with bypasses, outer beltways, and improved public transit utilization. I am wondering would increased funding for these proposed initiatives also help alleviate congestion and air pollution problems, or would the initiative just continue to add to metropolitan sprawl that will soon result and greater congestion and greater air pollution?

Mr. BOOK. That obviously is a question that would need additional study. But it seems to me that as we are looking at the congestion problems we have today, it is necessary to relieve that congestion not only from the metropolitan areas in the east, but for the needs of the transient traveller. Those of us who drive in the metropolitan D.C. area certainly have a lot of experience in parking on the Interstate Highway System. I think the congestion here must be a shock to someone who passes through the area, as we see it on most holiday weekends for example. So I think what we are talking about is creating the loops far enough away from the city so that the person who is going from city A to city B does not have to experience the problems of the city near which they may be passing on their way from A to B.

However, looking at the dynamic economics that are involved with highway development—and this is the good news, bad news

story—we know that when highways are developed, they are a vital link in the development and growth of economy. As the folks who sat here and talked about the Interstate 66 Project, most assuredly with the development of that highway will come economic development. So it has got an upside, downside to both of them.

Mr. MINETA. Let me follow up on the economic benefits that you have indicated because your council has identified many of the economic benefits that are derived from a viable transportation infrastructure system. Your council also supports the establishment of a new Scenic Byways program in that post-Interstate Surface Transportation Program. I am wondering if you could explain to the committee the need for a Federal role in the establishment of a new program category, that is Scenic Byways, that would be eligible for funding under the Federal Aid Highway Program.

Mr. BOOK. There are many scenic roads already present in the United States. One of the more famous of course is Route 1 out in California. There are others in Virginia, Pennsylvania, and other portions of the country. These roads could be utilized for transition from one city to another without utilizing the already crowded Interstate System. So it could on one hand act as a relief; on the other hand it could act as a generator of additional business and become an economic development tool at the same time. So we are dealing really with a multiple approach to the development of that scenic byways programs.

Mr. KING. It also may not be necessary, Mr. Chairman, to create an additional program category for scenic byways. The Federal Highway Administration now has underway a very extensive study of the possibilities of a National Scenic Byways Program and the composition of that program. But for the present time all we are suggesting is at least the possibility of qualifying scenic byways for eligibility under current Federal highway funding. This is as far as we are prepared to go at this point in time. I don't think that we are really arguing for an additional categorical program here.

Mr. MINETA. Thanks, Aubrey.

Mr. Shuster.

Mr. SHUSTER. Thank you, Mr. Chairman. I have no questions, I just want to compliment you gentlemen on your testimony. In central Pennsylvania, tourism is in some of my counties the number one industry, and in others, the second and third, but extremely important. And so it is important that we not only provide the transportation but the scenic transportation as well to attract people so they can spend their money in central Pennsylvania.

Thank you very much.

Mr. BOOK. Thank you, sir. As a resident of East Berlin, Pennsylvania, it is nice to see you.

Mr. MINETA. Mr. Lewis.

Mr. LEWIS. No questions, Mr. Chairman.

Mr. MINETA. Mr. Book and Mr. King, thank you very much for your testimony here today.

Mr. BOOK. Thank you, sir.

[Mr. Book's prepared statement appears on page 1717.]

Mr. MINETA. I would now like to call on a panel consisting of Mr. Roland McElroy, President of the Outdoor Advertising Association of America; the Honorable Archie Amos, a member of the Council,

City of Buffalo, New York; and Ms. Sherri George, Director of Advertising and Marketing, Hoss' Steak and Sea Houses Corporate Office, Altoona, Pennsylvania.

Mr. McElroy, your statement will be made a part of the record. If you would go ahead and proceed in your own fashion.

TESTIMONY OF B. ROLAND McELROY, PRESIDENT, OUTDOOR ADVERTISING ASSOCIATION OF AMERICA, INC.

Mr. McELROY. Thank you very much, Mr. Chairman. I am Roland McElroy, President of the Outdoor Advertising Association of America. Before I begin my formal testimony, I think it may be useful to the committee for me to take a moment and explain just what we mean by the term "billboard." I think in so doing that it will better enable the committee to know who we are and who we are not, and it probably would help me as well. I am the new kid on the block, having just been on this job about a year. But I think it would be good for the committee to take a look at this photograph, because this is the type of photograph that you are typically shown by those who would like to ban billboards. This is a usual indication of excessive sign clutter. If you were to repeal the Highway Beautification Act in its entirety, the only billboard that would be effected in this picture would be this one, because it is the only billboard in the picture. It is the only billboard in the picture. The rest are non-standardized, on-premise signs. It might further be useful for us to say that we also represent the typically standardized signs that are known as 30 sheet poster panels and painted bulletins. The sizes of them are 12 by 25 feet for the 30 sheet panels; and typically 14 by 48 feet for the painted bulletins. These are standard sizes. These are sizes that have been standard for decades. The size for the standard poster, the 30 sheet poster, was set back in the 1920's and early 1930's, it has not changed. The size of signs has not changed.

Mr. Chairman, I ask that this photograph be circulated among the members of this committee, and further request that if it be your desire, it be made a part of the record.

The OAAA is composed of 200 outdoor advertising companies which operate in over 7,000 communities throughout the United States. These companies range in size from very small companies, often managed by the second or third generation of family ownership, to large publicly held companies with diverse business interests.

Our member companies maintain approximately 80 percent of the estimated 500,000 sign structures currently in existence in America today.

On the surface it may seem disingenuous for any industry to argue that a law which regulates it may also serve the public interest. The fact is that the just compensation provisions of this statute are of critical importance to billboard owners. But this aspect of the statute simply reaffirms a basic tenet of the Bill of Rights which guarantees to every individual and every business in this country the basic right to be compensated when property is expropriated by governmental action. That is the core interest that the OAAA seeks to preserve; that is the fundamental reason why we

support an Act which otherwise imposes considerable constraints upon our business. It also reflects the essential balance that was struck by the Congress in enacting this statute. Our opponents want to upset this balance because they say "things have regressed terribly." Allow me to tell you how things have really changed in the last 25 years.

In 1965 there 1.1 million signs along our Interstate and Federal aid primary highways. Since that time, over 710,000 signs have been removed, including 95 percent of the illegal structures in existence in 1965. Furthermore, while the number of signs has gone down dramatically, the miles of Interstate and primary highways have expanded significantly. There are still some illegal billboards, still some signs located in scenic area, but we believe that number is very small and can be readily eliminated through effective enforcement action or negotiated removal programs.

Indeed—and this is important—there is much evidence that the statistics bandied about regarding the number of problem signs is grossly inflated and unreliable. The State of Arizona, for example, reports that there are 675 non-conforming signs rather than the 3,514 reported by DOT.

In testimony before this subcommittee about a month ago, even the anti-billboard lobby admitted they were not confident of their statistics.

Now let me make an important point, non-conforming signs and illegal signs are not the same thing. Non-conforming signs, like all non-conforming uses, are sanctioned by law and can remain in existence. Illegal signs have no lawful status and are not protected by the Highway Beautification Act. You can take them down. Twenty-five years after enactment of the Highway Beautification Act, the public simply does not identify billboard control as a pressing environmental issue.

During this past week, just two days ago preceding Earth Day, the news media were full of stories about the major environmental issues facing Americans. In none of the opinion surveys reported were billboards mentioned as an environmental concern of Americans. For example, in Gallup's Earth Day Poll, conducted April 5–8, citizens were asked to list their major environmental concerns. No one named billboards. Indeed, during the Earth Day celebrations last week, billboards were used by local sponsors in many areas to promote environmental awareness. Many of our companies were specifically asked by the Earth Day sponsors to put up billboards promoting environmental awareness.

It is important that you know what the OAAA supports and what it opposes. The OAAA believes that billboards are compatible with other commercial land uses and should be located in commercial or industrial areas. We do not support the establishment of special zones carved out of rural environments solely to permit outdoor advertising, so-called bogus zoning. The OAAA supports enforcement action to eliminate illegal signs that have been erected without authorization. The OAAA supports the right of all to advertise lawful products as well as non-commercial and political messages. That is a right precious to all of us. Finally, we are against the unauthorized cutting of vegetation along the highway

right-of-way and we support effective enforcement action at the State level to prevent these abuses.

We do support the Highway Beautification Act. The record demonstrates that the law has worked and that it retains its vitality as the core regulatory device for controlling billboards on the Nation's principle Federal highways. We strongly support the principle of just compensation as articulated in the Constitution, as defined by the framers of the Highway Beautification Act, as reaffirmed 13 times in the past 25 years by the Congress, as reaffirmed by the courts, Federal and State, numerous times. The two most recent State Supreme Court cases, decided just last month in Georgia and Colorado have made abundantly clear that cities must not force the removal of signs without cash payment.

The outdoor advertising industry is a responsible broad-based industry that is sufficiently regulated at the Federal, State, and local levels. We accept the notion that billboards should not be everywhere. But decisions must be made on the basis of reality. Businesses have a right to promote their legal products and services; citizens have a right to be informed and to use our medium to inform others. Billboards are a part of American life because Americans respect variety, efficiency, and the unique combination of effectiveness and egalitarianism billboards represent.

Thank you, Mr. Chairman.

Mr. MINETA. Thank you very much, Mr. McElroy.

Let me now call on our Councilman from the City of Buffalo, Mr. Amos.

TESTIMONY OF HON. ARCHIE AMOS, JR., COUNCILMAN, CITY OF BUFFALO, NY

Mr. AMOS. Thank you, sir. My name is Archie Amos, a Councilman of the City of Buffalo. First of all, I would like to thank Congressman Norm Mineta and his committee for the opportunity to address this honorable body's subcommittee which is considering the Surface Transportation Reauthorization Bill.

The freedom of speech and expression guaranteed by the First Amendment is under not so subtle attack. Recently, as in the past, some miseducated people and/or groups have decided to target advertising agencies, product producers, and ad space providers, charging them with everything from polluting the scenery to causing cancer.

Let me first state for the record that the City of Buffalo, New York, and its legislative body, stand firmly and wholeheartedly behind the outdoor advertising industry. This, however, was not always the case. In 1985, the City of Buffalo enacted a moratorium on the development of outdoor advertising structures. Had this moratorium continued, 3M and Penn Advertising would have virtually been nonexistent on all city-owned property. The conditions that caused this moratorium were quite simple. Companies like the former Whitmier and Ferris, all of which was subsequently purchased by Penn Advertising, did nothing to update their structures or the structures' surroundings, in other words, the landscaping.

Many city officials and citizens became quite outraged and incensed at the insensitivity of these companies. Billboard structures,

while having their ads change frequently and providing much profit to their owners, were seldom repaired. Many of the old channel iron structures stood with their structure members dangling or laying on the ground unpainted and unkept. Not one of the former owners of these companies made any serious attempt to rectify the situation. The City was committed to seeing that upon the lease expiration the structures would come down, never to exist again.

If allowed to digress a moment, I would like to make clear how I, as a legislator, got involved with writing the City of Buffalo's billboard ordinance. As many of you know, the City of Buffalo was once a heavily industrialized city. The demise of the steel industry left us with the need to find replacement industries to help keep our population working and our economy afloat.

Since 1985, the service sector of our city has grown tremendously. This, coupled with the signing of the U.S.-Canadian Free Trade Agreement, has caused Buffalo to now experience new and surprisingly accelerated growth. Being an urban planner by education and having a strong interest in economic development, I had begun to look at what businesses had survived industrial death and was examining ways to strengthen and encourage their growth. As fate would have it, I had the good fortune of meeting Mr. Wayne Lamm, formerly General Manager, now Vice President of Penn Advertising, at a March of Dimes' affair. We began to talk about his industry, one that I knew completely nothing about. Mr. Lamm brought to my attention the situation facing the billboard industry on the local level, and, in turn, I began to apprise the situation and began to explore the city ordinances, only to find out that no meaningful rules or regulations were in existence. However, there was a moratorium. I began to gather data on the billboard advertising industry on a national level and became quite intrigued by it growth potential and what it could mean to the city seeking and needing growth industries.

After successfully getting an extension of all city leases due to expire, I was appointed by our City Council to chair a committee that became known as the Billboard Legislation Committee. The committee consisted of our city's Corporation Counsel, Controller, representatives from 3M and Penn Advertising, and, of course, myself. I have always felt that to have meaningful laws, all affected parties must be a part of any rule construction. The end result is a law all can live and growth with. The entire ordinance development process took approximately one year to date to the day we started. The first six months or so were used to do research so that the city representatives thoroughly understood what we were dealing with. It became clear to all of us as we began to learn more about the industry, that what was before us was an opportunity we had been seeking.

In its simplest description, our ordinance, which I have here and I would like to submit as part of the record, placed a limit on the maximum amount of signs allowed on city property. It restricted development along water routes, it increased the distance between structures, thereby precipitating the need for the industry to remove many of the structures. We have reduced them drastically, and I have a fact sheet that I will submit. It also set minimum distance from residential zones. All roof mounts that existed at the

date of passage of this ordinance were to remain, however, no further erections of this type were to be allowed. It demanded that all channel beam construction be brought into the new industry standards within a four year period. Finally, and in my mind the most significant, the city would now be the recipient of a much greater share of the profits realized by the ad companies. Before my legislation, our city received a maximum of $35 per location. Today, our rates range from $400 to $1,700 per location, per space, per year, with a renewable and renegotiable five year lease. Our city also receives a 6 percent increase every year during the five year period. This increase is based on the previous year sales. Today, the outdoor advertising industry and the City of Buffalo are in harmony; both benefitting from a cooperative effort.

Let me add as a further note, Mr. Chairman, that one of the things we found in the City of Buffalo that made 3M and Penn Advertising easy people to deal with was their willingness to become involved in the community projects. Over $2 million by Penn Advertising alone have been dedicated for public service use, and this is over the three year period that they have been there. They have been quite cooperative; we have been quite cooperative with them; and we found a way that we can really work and live together.

Thank you very much.

Mr. MINETA. Thank you very much, Councilman Amos.

Your fact sheets will be added to the record.

[Mr. Amos' fact sheets follow:]

PENN ADVERTISING
BUFFALO DIVISION RENOVATION

"Making a Commitment to the Communities We Serve"

ACQUISITIONS AND RESTRUCTURING

***December 1986:** Penn Advertising acquires assets of Whitmier & Ferris Company. Whitmier & Ferris had been an established business in Buffalo since 1872.

***December 1986 & June 1987:** Penn also acquires poster panel billboards from National 3M Company and Victor Outdoor.

*Penn hires General Manager A. Wayne Lamm to restructure the market, refurbishing billboard structures that were 50-60 years old, and also involve Penn Advertising in the community of Buffalo.

*Presentation is made to the City Council of Buffalo regarding planned restructuring of the market to update billboard structures and help reverse a city moratorium on billboard structures.

***TOTAL NUMBER OF BILLBOARDS AT TIME OF ACQUISITION:**

1231 30-SHEET POSTER PANELS
322 8-SHEET POSTER PANELS
81 PAINTED BULLETINS

***TOTAL NUMBER OF BILLBOARDS ON 12/1/88:**

1120 30-SHEET POSTER PANELS
308 8-SHEET POSTER PANELS
77 PAINTED BULLETINS

During Penn Advertising's first year of renovation in the Buffalo market **129 billboards were removed** due to restructuring (replacing multi-units with single pole structures).

In that same year Penn Advertising remodeled or refaced 300 poster panels and 70 painted bulletins, and landscaped over 50 leased billboard locations. (See enclosed slides)

TOTAL SPENT ON RENOVATING MARKET 1986-1990: $4 MILLION

BILLBOARD TASK FORCE RECOMMENDATIONS

THE BILLBOARD TASK FORCE, AFTER EXTENSIVE REVIEW OF EXISTING "NON ACCESSORY SIGN ORDINANCES, SECTION 17 PARAGRAPH H, MAKE THE FOLLOWING RECOMMENDATIONS:

AMEND

SECTION

H (1) PARAGRAPH (1)--change 300 square feet to 675 square feet. This change reflects the industries standard. -350

H (1) PARAGRAPH (2)--change 500 feet spacing to 1000.

H (2) PARAGRAPH (3)--change 500 feet spacing to 1000.

H (2) PARAGRAPH (3)--change 100 feet spacing to 300. ok

H (2) PARAGRAPH (4)--omit because Paragraph (3) establishes distance from residential district. Remove

ADDITIONS

10. ROOF MOUNTS

ALL EXISTING ROOF MOUNTED DISPLAYS ARE HEREBY GRANDFATHERED IN. NO FURTHER ROOF ERECTIONS WILL BE ALLOWED.

11. EXISTING STRUCTURES

ALL EXISTING STRUCTURES THAT ARE NOT PRESENTLY MEETING THE INDUSTRY STANDARDS ARE TO BE BROUGHT INTO COMPLIANCE WITHIN FOUR YEARS.

12. LEASES

ALL LEASES WILL BE SUBJECT TO A 30-DAY WRITTEN NOTICE OR CANCELLATION IN THE EVENT SAID LOCATION IS SOLD OR NEEDED FOR DEVELOPMENT. ALL LEASES WILL RUN FOR A FIVE-YEAR PERIOD.

A). IN THE EVENT SUCH CANCELLATION OCCURS, BOTH LESSEE AND LESSOR SHALL WORK JOINTLY IS SECURING AN ALTERNATE LOCATION FROM THE RESERVE POOL. THE NEW LOCATION WILL BE SUBJECT TO ALL ZONING AND PERMIT REQUIREMENTS AND REGULATIONS AS DEFINED BY THE CITY SIGN ORDINANCE.

B). UPON NORMAL EXPIRATION OF A LEASE, THE COUNCIL WILL REVIEW EACH LOCATION BEFORE RENEWAL IS GRANTED. IF IT IS DETERMINED THAT SAID LOCATION IS NO LONGER CONDUCIVE TO THAT AREA. THE SAME JOINT PROCESS OF SELECTING A NEW LOCATION WILL OCCUR.

C). ALL EXISTING LEASES WILL BE SUBJECT TO ALL NEW BILLBOARD STANDARDS SET FORTH UPON THEIR EXPIRATION.

13. NEW LOCATIONS

ADVERTISING AGENCIES WILL EXAMINE A LIST OF IMPROVED PROPERTIES HELD BY THE DIVISION OF REAL ESTATE THAT HAVE BEEN FOUND TO MEET ALL BILLBOARD ZONING REQUIREMENTS (I.E. C2, C3, ETC.). APPLICATIONS OF SELECTED LOCATIONS WILL BE SUBMITTED TO THE COMPTROLLER. THE COMPTROLLER WOULD FORWARD THOSE REQUESTS TO THE COUNCIL FOR EXAMINATION AND APPROVAL. ONCE APPROVED, THE ADVERTISING AGENCY AND COMPTROLLER WOULD EXECUTE THE NECESSARY LEASES.

BILLBOARD TASK FORCE RECOMMENDATIONS
PAGE TWO

14. RESERVE LOCATIONS

THESE ARE LOCATIONS THAT WILL BE USED AS ALTERNATE LOCATIONS IN THE EVENT PROPERTIES NOW LEASED ARE SOLD OR NEEDED FOR DEVELOPMENT. THE ADVERTISING AGENCIES WOULD REVIEW LOCATIONS AND REPORT THE DESIRED REPLACEMENT LOCATION TO THE COMPTROLLER AND COUNCIL. IF RESERVE LOCATION IS AT THAT TIME STILL CONDUCIVE TO BILLBOARD DEVELOPMENT, THE AGENCY WOULD BE ALLOWED TO ERECT A NEW SIGN. THE NEW LOCATION WOULD BE SUBJECT TO ALL ZONING AND SIGN ORDINANCES. IN CASE OF A DUPLICATE REQUEST (I.E. TWO OR MORE COMPANIES REQUESTING THE SAME LOCATION), AN AUTOMATIC BIDDING PROCESS WOULD BEGIN.

15. BIDDING PROCESS

OPENING BIDS WILL BEGIN AT THE FIXED RATE, PER FACE (I.E. 6 X 12 = 400.00, 14 X 48 = 1700.00,) ETC. WITH THE LOCATION AWARDED TO THE HIGHEST BIDDER.

16. MAXIMUM NUMBER OF LOCATIONS

THE MAXIMUM NUMBER OF LOCATIONS TO BE ALLOWED WITHIN THE CITY OF BUFFALO WILL NOT EXCEED 100 SITES.

17. MONETARY BENEFIT TO THE CITY

CITY TO RECEIVE ITS' REVENUE BASED ON THE TOTAL NUMBER OF LOCATIONS LEASED BY THE ADVERTISING AGENCIES. THE CITY WOULD BE PAID A FLAT-RATE PER FACE PER LOCATION, PLUS A 6% INCREASE PER YEAR, BASED ON THE PREVIOUS YEAR'S RATE. LEASES WITH THE CITY WOULD RUN FOR A FIVE-YEAR PERIOD. UPON EXPIRATION OF SAID LEASE THERE WOULD BE A PERCENTAGE ADJUSTMENT ON THE FLAT RATE BASED ON THE PERCENTAGE OF INFLATION.

FEES PER FACE PER LOCATION

POSTER PANELS	6 X 12	$ 400.00
	12 X 25	700.00
PAINTED BULLETINS	10 X 36	1200.00
	14 X 48	1700.00

Leg

BY: MR. AMOS

RE: ORDINANCE AMENDMENT
SECTION 17(h) AND 17(i) OF
CHAPTER LXX NON-ACCESSORY SIGNS

The Common Council of the City of Buffalo does hereby ordain as follows:

That subdivision h of Section 17 of Chapter LXX of the Ordinances of the City of Buffalo be amended as follows:

(h) **Standards applicable to nonaccessory signs:** Nonaccessory signs shall not be erected to any residential district. In the "C1" neighborhood business district, no nonaccessory sign or signs shall be erected. In the "C2" community business district, "C3" central district, "CM" general commercial district and in all industrial districts, nonaccessory signs shall be permitted subject to the following regulations. No non-accessory sign shall be erected along the river or lakefronts west of the New York State Thruway, the Buffalo Skyway or Fuhrman Boulevard.

(1) In the "C2", "C3" and "CM" districts only one (1) nonaccessory sign structure shall be permitted on any lot with one hundred (100) lineal feet of street frontage or less and only one additional structure for an additional one hundred (100) lineal feet of street frontage or major fraction thereof. No such structure shall contain more than one (1) sign per facing that shall not exceed [three hundred (300) feet] six hundred and seventy-five (675) square feet.

No nonaccessory sign shall be located within three hundred (300) feet of another such structure located on the same side of the stret. In the case of a nonaccessory sign facing a limited access highway or expressway, no such structure shall be located within a distance of [five hundred (500)] one thousand (1,000) feet of any such structure located on the same side of such highway. No nonaccessory sign shall exceed an overall height above ground at the base of such sign of forty (40) feet, except for a sign oriented to an elevated road or highway, such height may be increased to that of thirty (30) feet above the pavement level of the elevated road.

(2) In industrial districts only one (1) nonaccessory sign structure shall be permitted on any lot with one hundred (100) lineal feet of street frontage or less and only one (1) additional structure for an additional one hundred (100) lineal feet of street frontage or major fraction thereof. No such structure shall contain over two (2) signs per facing and if the structure contains two (2) signs per facing (that is, facing the same direction), neither sign shall exceed three hundred (300) square feet in area.

In lieu of two (2) signs per facing, one (1) larger sign may be erected, not to exceed six hundred seventy-five (675) square feet in area, exclusive of customary extensions and embellishments that do not exceed twenty 20) per cent of that area.

No nonaccessory sign structure shall be located within three hundred (300) feet of another such structure located on the same side of the street. In the case of a nonaccessory sign facing a limited access highway or expressway, no such structure shall be located within a distance of [five hundred (500) feet] one thousand (1,000) feet of any other such structure located on the same side of such highway. No nonaccessory sign shall exceed an overall height above ground at the base of such sign of forty (40) feet, except for a sign oriented to an elevated road or highway, such height may be increased to that of thirty (30) feet above the pavement level of the elevated road.

(3) No nonaccessory sign shall be erected within [one hundred (100) feet] three hundred (300) feet of any residential district if it would face such district and be visible therefrom.

(4) No nonaccessory sign shall be erected next to a building in any zoning district used for residential purposes when closer than forty (40) feet to any window of an existing residential as measured from the sign to the window. No nonaccessory sign shall be erected within ten (10) feet to a building in any zoning district used for residential purposes even when such sign is not visible from any window of existing residential units.

(5) No nonaccessory sign shall be erected within two hundred (200) feet of any public park or parkway if it would face such park or parkway and be visible therefrom.

(6) No nonaccessory sign shall face Delaware Avenue between Chippewa Street and North Street if it would be within two hundred (200) feet thereof and visible therefrom.

(7) No nonaccessory sign shall be closer to any street line than the front line of the nearest building within fifty (50) feet; provided, however, that when a nonaccessory sign is erected between two (2) buildings within fifty (50) feet of the structure, no part of the sign structure shall be erected closer to any street line than a line drawn from the nearest front corner of the two (2) buildings.

(8) Except as otherwise may be provided in this chapter, any sign which for a period of three (3) years has not been repainted or reposted and on which the message on which has been removed or is totally or partially illegible or absent, or which pertains to a time, event or purpose which no longer applies, shall be deemed to have been abandoned. An abandoned sign is prohibited by this chapter and such sign and its structure shall be removed by the owner of the premises if not by the owner of the sign. Failure to remove an abandoned sign and sign structure, as described above, shall be a violation of this chapter. If the owner or lessee shall refuse or neglect to remove the sign and sign structure within three (3) months after delivery of a notice from the commissioner of inspections and licenses, the

commissioner may cause the sign and sign structure to be removed and the expense thereof shall be assessed against the owner of the property on which the sign is located in accordance with the provisions of the charter of the city relating to assessments. Delivery of the notice may be made by personal service thereof or by registered mail to the last known address of the owner.

(9) Modification of sign regulations. An applicant seeking modification of sign regulations contained in this section may submit a request for modification to the city planning board. The board shall investigate the request and present its findings and recommendation to the common council within one (1) month of its receipt of the matter. The common council may authorize and direct the approval or denial of a permit for the requested modification on the basis of the effect of such permit on the public health and welfare.

(10) Nothwithstanding any other provision of this chapter, roof-mounted non-accessory signs, which existed at the effective date of this amendment shall be permitted to remain, but no further roof-mounted non-accessory signs shall be permitted.

(11) Existing nonaccessory signs, including billboards, pole signs and similar advertising devices, which do not meet the regulations of this amendment on the effective date of this amendment shall be removed or brought into compliance herewith within four (4) years of the effective date of this amendment.

(12) Subdivision (i) of Section 17 of Chapter LXX of the Ordinances of the City of Buffalo is hereby repealed.

APPROVED AS TO FORM

PASSED.

RGB:bmg

Mr. MINETA. Ms. George, we have your statement. It will be made a part of the record. If you would go ahead and proceed in your own fashion.

TESTIMONY OF SHERRI GEORGE, DIRECTOR OF ADVERTISING AND MARKETING, HOSS' STEAK AND SEA HOUSES CORPORATE OFFICE, ALTOONA, PA

Ms. GEORGE. Good afternoon. Thank you for the opportunity to address our views on the billboard status. This is the first time I have had the pleasure of talking before such a distinguished committee, and so I thank you for the privilege.

Hoss' is a rapidly growing chain of steak houses in the central-western Pennsylvania. We feature a family-style restaurant with a "back to basics" scratch type cooking.

In the community, each of our locations provide employment for 60 people. In addition, we have a corporate support crew and other divisions of the company that total over 2,000 employees in the State of Pennsylvania.

We have a $50 million investment in our restaurant chain. Our sites are not considered to be prime locations. Real estate costs prohibit a company such as ours from negotiations for the selections of those type properties. For that reason, we rely heavily on outdoor advertising industry as our primary source of advertising.

I have a budget of $900,000 a year, $240,000 of which is earmarked for billboards. The importance of that figure is that it is the largest amount of money we spend anywhere in the company for anything. Our second largest donation is to the 4-H Baby Beef Sales at the auctions.

The billboards are an affordable medium for us. They provide us the opportunity to maintain our market presence. But most importantly, they serve as a directional map for the public. That is vital for our restaurants and for any other restaurants in the industry. Seventy-five percent of our billboards are strictly directional, and as our contracts are negotiated, we have been changing them all into directional. The local municipalities have varying standards that apply to the regulation of signage. Many of them prohibit a marquee large enough for the average driver. In a recent project, we acquired one of our locations, and the ordinances were such that the sign was not of a size to be effective. I drove past it and I knew where it was. It took us almost six months to obtain a billboard for that particular location, and it was still 11 miles away, but at least it gave people the awareness that we were 11 miles ahead on the left. That restaurant was projected to be one of our highest sales volume restaurants, but only after six months of waiting to obtain a directional billboard, did we start to meet our projected budget. It just wasn't there.

In a few instances, very few, but a few instances such as these, the billboards have been a direct influence on the restaurant industry as to whether or not the restaurant is a profit center or sort of at the break-even point. We have seen as much as a 20 percent increase in customer count when key billboard locations were accessible.

With the Hoss locations as they are, billboards are, again, an affordable medium for our company. They provide us with the opportunity to enforce the continuity of our message and our business across the State. The cost, with respect to the market value in a particular market, for one month is often less than 30 seconds of air time. We have no other cost efficient way to maintain the same value or market presence.

I spoke about market presence, the continuity, the basic facts of billboards. I have not even begun to address the educational or the safety or the other issues directly related to outdoor advertising. I have heard other speakers address them for me, very fortunately. I couldn't see where environmentally billboards ever cause any harm. Aesthetically, they are questionable, but they have been accepted as a traditional form of information for the American public. There needs to be an evenly weighed scale on the balance between economics, information, and aesthetic interests.

Speaking for a company who derives growth based on success, profits, and customer satisfaction, none of these things can be accomplished without the right combination of marketing. Billboards are a part of that formula. Perhaps the solution between economics and aesthetic values can be neutralized by energy spent on creative solutions and laws that would regulate maintenance and the overall quality of the existing outdoor medium. We even have a few.

Again, thank you for the opportunity to appear here today.

Mr. MINETA. Thank you very much, Ms. George, for your testimony.

Mr. McElroy, the OAAA acknowledges that there are problems in the implementation of the Highway Beautification Act due to inconsistent or lax enforcement. Does OAAA have any recommendations to improve the enforcement of the provisions of the Highway Beautification Act?

Mr. MCELROY. We think first of all that of course illegal signs which are out there can be removed with no further authority needed at any level. They can be removed without the expenditure of any taxpayer funds. Before any further action could be recommended, however, legislatively or otherwise, I think it would be important for us to know just how many signs in each category remain. As I indicated in my testimony, I think that a comprehensive, in-depth, meaningful inventory would be helpful to all of us before we can come up with concrete recommendations.

Mr. MINETA. During the consideration of the Surface Transportation and Uniform Relocation Assistance Act of 1987, the Congress considered several amendments to the Highway Beautification Act which would not mandate the payment of just compensation for the removal of non-conforming signs. Does OAAA support any amendment to the just compensation requirements of the Highway Beautification Act, and, if so, can you explain?

Mr. MCELROY. No, Mr. Chairman. We think the Act has worked well, that the framers of the original Act who debated this issue at length and, of course, the other members of congress who have revisited this issue at length at least 13 times over the last 25 years and have reaffirmed the principle of just compensation and the interpretation of it to mean the payment of cash compensation. We think that issue does not need to be revisited, that the issue is

clear. The Fifth Amendment to the Constitution, which says that private property shall not be taken for public use without the payment of just compensation, does not mean amortization. The Constitution doesn't say let a period of time elapse and let that constitute compensation. We think this issue has been debated over and over and it is time finally to lay it to rest. We would not advocate any amendments on that issue.

Mr. MINETA. OAAA has consistently supported funding for implementation of the provisions of the Highway Beautification Act and recommends an authorization level of at least $5 million. Based on the number of non-conforming signs along Interstate and primary highways, what would be your estimate of the cost to remove all non-conforming signs.

Mr. MCELROY. That's a very good question. First of all, it goes back to what I said earlier, we know that according to latest FHWA report there are 99,919 non-conforming signs that they count in existence on FAPs and Interstates. We think that number may be considerably inflated. So before you can arrive at a figure as to how much it would cost to remove the remaining non-conforming signs, I think we would have to come up with an accurate number of how many there are.

Mr. MINETA. Councilman Amos, several Members of Congress have expressed concerns for certain types of messages that are conveyed by billboards that encourage actions that may endanger one's health. Has the City of Buffalo been able to work effectively with the billboard industry to encourage responsive use of billboards to convey messages that are sensitive to the Nation's health concerns?

Mr. AMOS. Yes, we have. We found that working with the ad agencies has been very easy. They have been very receptive to our suggestions. But let me say as an additional note, I think under the First Amendment where freedom of speech is protected, that whatever message is on billboards, as long as they are legal products, it is protected and should continue to be protected. There are just as many signs, relative to smoking—against smoking as there are promoting tobacco products. To me, it is an insult for anyone to say that a picture would be so influential that it would cause one to do something that is detrimental to one's health or well-being. We have the intelligence I think to make choices and I think that as long as information is out there, whether we are for it or against it, it gives us an opportunity to create that balance needed in our judgments.

Mr. MINETA. Can you explain how the billboard industry has enhanced economic development for the City of Buffalo?

Mr. AMOS. Oh, yes, quite definitely. As part of the record which is being submitted, if you just look at the employment levels, initially there were only 16 employees under the former companies all total; just 16 employees. In just the short period of time that Penn has come in and taken over other companies, they have already grown to 47 and project that it will go higher. This has given income to those who work for them, it has also helped the City of Buffalo in terms of people spending their money in the city. We are collecting money by way of taxes on the homes that they are buying and products that they are purchasing.

Mr. MINETA. The Highway Beautification Act establishes requirements for the location of billboards along Interstate and primary highways on the Federal Aid Highway System. Do the provisions of the Highway Beautification Act apply to the billboards located within the City of Buffalo?

Mr. AMOS. We have even taken it a step further. We have put distance limitations between signs, which has caused the industry to have to remove some signs on major highways. Our ordinance requires 1,000 feet between signs and no closer than 300 feet to residential areas, and they cannot be facing those residential areas.

Mr. MINETA. Ms. George, you have stated that billboard marketing has had a direct influence on the profitability of the restaurant business. Has the lack of the availability of billboards for marketing purposes hindered the profitability and growth of Hoss' Steak and Sea House Restaurants?

Ms. GEORGE. I wouldn't use the word restaurants, plural, but there have been occasions with several of our restaurants, as we mentioned, where the signage is so limited that the addition of billboards was a direct influence and, indeed, actually changed the restaurant.

Mr. MINETA. Very well.

Mr. Shuster.

Mr. SHUSTER. Thank you very much, Mr. Chairman.

We certainly appreciate your testimony here today. Ms. George, I want to compliment you particularly on your testimony. It was very effective when you can give us evidence that billboards will increase your sales by 20 percent, that's effective. In fact, my own experience a few years ago where I was using a billboard in a campaign and Governor Casey of Pennsylvania was driving throughout the State, he was campaigning, and he said, "Bud, those billboards you have got throughout central Pennsylvania and the particular copy on them are absolutely tremendous. Every place I go I see your billboards." The fact of the matter is there was only one billboard and it was on 220. It certainly was a testimony to the effectiveness of billboards in selling products. I guess that is what some people object to, and that is some of the products that get sold. But that's another story.

Mr. McElroy, I want to compliment you, too, on your testimony. I can remember the days when the billboard industry was pretty much only concerned about selling billboards and making money, and that was sort of difficult for those of us who supported the industry. But I think your statesman-like testimony was certainly very impressive. The fact that you support scenic byways, which means billboard-free highways, is certainly statesman-like. The fact that you have indicated that the billboard industry on average only has about 10 percent of their boards on cigarettes also is impressive. I understand our colleague, Mr. Waxman, is probably going to be introducing legislation in the near future to limit cigarette advertising. If you already only have 10 percent of your boards in cigarette advertising, then the 10 percent cap on cigarette advertising probably wouldn't be too harmful, and I am sure he will be happy to know that.

One of the things that intrigues me, let me ask you, Mr. McElroy, there has been so much progress, which you have outlined,

why don't we simply record a victory and go home. Senator Chafee today I understand introduced legislation returning the decisions on billboards to State and local Government, essentially getting the Federal Government out of the business. What is wrong with that?

Mr. McElroy. Why would you turn back the clock on any effective legislative initiative. That is what Senator Chafee and others would have you do with the bill that they have introduced today. They want to turn back the clock 25 years and make it an issue again. Billboards are not an environmental issue at the present time——

Mr. Shuster. Educate me, maybe I misunderstand. If Senator Chafee's legislation were enacted, this would not permit the construction of more billboards would it?

Mr. McElroy. No, it wouldn't be turning back the clock in the sense that——

Mr. Shuster. You have outlined a tremendous accomplishment, so——

Mr. McElroy. One of the things he would do in his bill would be to give the States the authority to determine whether compensation should be amortization or cash. All the efforts that are included in his bill would weaken the present regulatory structure that has worked so well over the last 25 years.

Mr. Shuster. Would that mean then that a State, for example, could say more billboards could be built, that where they had been taken down, they could be put back up?

Mr. McElroy. It would give the States complete authority I would think in that regard. That is part of what I see as the problem. You would have chaos out of control. At the present time, you have control of billboards, which is what the original framers of the Act wanted.

Mr. Shuster. So Chafee's legislation could——

Mr. McElroy. You could have chaos.

Mr. Shuster. They could either take down more boards or permit the construction of more boards; it could go either way? I don't want to put words in your mouth, but I want to understand what you are saying.

Mr. McElroy. I have not looked at the details of his legislation which he introduced today. It certainly would upset the balance that currently exists in controlling the proliferation of billboards.

Mr. Shuster. In which way, down or up? Could it not be argued that some States could take down their billboards, other States could permit—for example, in New York, in Buffalo, where they are so pleased with them, then they could permit more construction of billboards. Couldn't it go either way?

Mr. McElroy. It places a moratorium on certain roads, interstates, highways, and FAPs, for instance, so States would not have the authority to allow the construction of billboards on those streets, according to my reading of the major points. Again, I haven't read the legislation.

Mr. Shuster. Let me ask you, Mr. Amos, a question. Did I understand you correctly that in Buffalo you have a tax on billboards and it becomes a source of revenue?

Mr. Amos. There is a fee for billboards on all city-owned land.

Mr. SHUSTER. City-owned land. But this is not a tax on other billboards in the city? It is a fee for renting space on city-owned land?

Mr. AMOS. It is based on city-owned land and applies to all billboards within our jurisdiction, whether they are on private land or not.

Mr. SHUSTER. Oh, which are on private land? So it is a tax?

Mr. AMOS. We don't call it a tax, we call it a fee.

Mr. SHUSTER. It's a fee, okay. Read my lips, no new taxes. Right. It is a user fee. We like user fees in this committee. So you are saying it is a fee if I own a piece of property and I lease that piece of property to Mr. McElroy who puts up a billboard on it, he has to pay you a fee——

Mr. AMOS. Based upon the size——

Mr. SHUSTER. Based on the size of that board whether or not the city owns that property.

Mr. AMOS. Exactly.

Mr. SHUSTER. So this becomes a new source of revenue.

Mr. AMOS. Exactly.

Mr. SHUSTER. So do you recommend that other cities consider this as a new source of revenue as well?

Mr. AMOS. We have a cap. They cannot exceed the cap. They can only produce at a maximum 100 more signs on city property within city limits. In order to assist them whereas it relates to city-owned land, as we see a need to develop or sell that land, our controller banks land all year, and we give them the opportunity to look at replacement locations or new development locations.

Mr. SHUSTER. It is interesting. I hear some of the criticisms that as long as we require just compensation and the States don't come up with enough money to take down billboards, maybe cities could start taxing billboards and then use the revenue from billboards to take down other billboards. It becomes an interesting concept. I am intrigued with the idea of a user fee and cities possibly considering that.

Well, I very much appreciate your testimony. Thank you very much.

Mr. MINETA. Mr. Lewis.

Mr. LEWIS. Thank you, Mr. Chairman.

Mr. McElroy, your photograph tells me that perhaps my bill really doesn't go far enough. What that photograph tends to demonstrate is an excellent example of what I like to call litter on sticks, community clutter by billboards or things that look like billboards, at least to me.

Councilman Amos, you are from Buffalo, I know Buffalo, I have a lot of relatives living in Buffalo. The first time I left the south in 1951, when I was 11 years old, I took an automobile trip from rural Alabama to Buffalo, New York. I am glad to know that your city has developed a sign control system. I think all we are proposing is to give you the power, give it back to the cities, to control billboards, to give you a way to get rid of non-conforming signs.

Ms. George, let me just ask you a few questions. You stated in your testimony that most important are billboard service directional maps for the public. Do you know anything about directional signs used in some States, such as Virginia, the small signs on which several restaurants may be listed, with very narrow arrows

indicating how to get to their restaurants, and the indication of the mileage to these different restaurants. Have you seen those type signs?

Ms. GEORGE. Are you talking about the logo signage?

Mr. LEWIS. Yes.

Ms. GEORGE. Yes, sir. We were one of the pilot people in the State of Pennsylvania program when they developed it. We were one of the originals.

Mr. LEWIS. Have you ever travelled from Petersburg, Virginia to Richmond and seen those little signs along the way on I-95?

Ms. GEORGE. I have travelled I-95 near Richmond, yes.

Mr. LEWIS. Do you think those signs are effective for the purpose of giving directions?

Ms. GEORGE. Yes, sir, I do.

Mr. LEWIS. You stated in your testimony that the aesthetics of billboards are questionable. Won't you agree that the smaller uniform signs found along the highway of Virginia are a little more pleasing?

Ms. GEORGE. No, sir, I don't.

Mr. LEWIS. Wouldn't it be a little more pleasing to look at a small directional sign rather than something six stories high?

Ms. GEORGE. Well, compared to what? I mean, in perspective, compared to what? I find that they are boring.

Mr. LEWIS. Mr. McElroy, a number of the numbers you used in your testimony were confusing to me. You said that the billboard industry employs about 100,000 people. According to the 1985 U.S. Census publication, only 12,290 people were employed in the outdoor advertising industry in 1985. Can you tell me why this difference?

Mr. MCELROY. We have included in that number all of the people who are directly and indirectly in the outdoor advertising business; who get some portion of their income directly or indirectly, or some other benefit, from being associated with the industry. That is how many people we estimate would be affected.

Mr. LEWIS. You further stated that there are 200 outdoor advertisers in your association?

Mr. MCELROY. Members of our association. There are others out there.

Mr. LEWIS. Isn't it a fact though that about 70 percent of all billboards are owned by just nine companies?

Mr. MCELROY. I don't think that is correct. Most of them are small businesses. We do have several large outdoor advertising companies in America that do own a large number of billboards. But billboard companies have been around for 200 years and, as I said in my testimony, some of them are now being managed by second and third generation families. They have been around a long time. We have one company that has been run by one family continuously for over 100 years up in the northeast. The largest majority of our member companies are small businessmen spread out all over this country.

Mr. LEWIS. You stated that tobacco ads accounted for only 10 percent of all billboard ads. But I am looking at a summary of an excerpt from the Advertising Age, dated November 28, 1988. It says that eight of the top ten advertisements on billboards are tobacco

or alcohol advertisements. In minority neighborhoods, according to a recent report that I read, 70 percent of all billboards advertise alcohol or tobacco. Do you know anything about those reports?

Mr. McElroy. Yes, sir. Tobacco, while it is still the number one single category of advertiser on the billboards, it is rapidly being challenged by a host of other categories. Health, for example, has risen over 300 percent in the last decade. Television, the media in general, has risen over 300 percent in the last decade. In fact, many of the newspapers that criticize us freely on the editorial pages are some of our biggest users in the same communities. So the number of major users is quite large indeed.

Mr. Lewis. I am looking at a report prepared by the Congressional Research Service. There is a report on 1988 outdoor spending by categories, the source of which is listed as the Outdoor Advertising Association of America. According to this table, of the five top advertisers, tobacco advertisers are number one and alcohol advertisers are number two. Tobacco advertisers spend more than two times as much for outdoor advertising as do advertisers in the second largest category. Were you aware of this report?

Mr. McElroy. I am aware of the fact that tobacco has been a very good customer of the industry for quite a long time. But the percent of their spending as a percent of our revenue has been in a seven year decline. As these other categories have gone up, the percent of dollars spent in our medium as a percent of revenue have been on the decline, and we think that is an encouraging factor.

Mr. Lewis. Let's move to another area where I have some concern. On the compensation issue, I think the easy way for us to resolve this issue once and for all is for me to walk through my understanding of the issue. You stop me where I go wrong or where I may misspeak or where I say half-truths or where I just don't imply the truth, okay? The Highway Beautification Act was enacted in 1965. Its purpose was to provide for scenic development and rural beautification along Federal highways. It was to protect our tremendous investment in our highway system, and it was to protect the safety of our highways. Towards this end, Congress asked the States to develop plans for the control of outdoor advertising. We told the States that we would help them make sure that their plans were adhered to. Am I right so far, Mr. McElroy?

Mr. McElroy. Yes, go ahead.

Mr. Lewis. Until 1978, States could compensate billboard owners without paying them cash. They could allow a billboard to stay up despite their being non-conforming for a prescribed period of time. That period of time was called an amortization period, a grace period, a write-off period. Have I said anything wrong so far?

Mr. McElroy. Up to what time? 1965.

Mr. Lewis. What about up to 1978?

Mr. McElroy. I am sorry. In some cities, that is true. The 1978 amendments did change that, I am sorry. Go ahead. I just didn't hear the date.

Mr. Lewis. In 1978, the Highway Beautification Act was amended so that the States had to pay cash for the removal of non-conforming billboards. The States had to pay 25 percent of the cash compensation and the Federal Government has to pay 75 percent of the cash payment. Is that correct?

38-253 O—91——54

Mr. McElroy. Yes.

Mr. Lewis. Since 1982, no Federal funds have been appropriated for the removal of non-conforming billboards. Is that correct?

Mr. McElroy. The 1965 Act required the States to pay for billboards. You could not have amortization on FAPs on interstates following enactment of the 1965 Act.

Mr. Lewis. What happened in the 1978 amendments? It is my understanding that——

Mr. McElroy. This is an important issue. And I would like to have it explained carefully, fully, and accurately to the members of the committee. If it is all right with the Chairman, I would like to ask Mr. George McInturff, who was there at the enactment, to give us his understanding of the Act as signed into law at that time.

Mr. McInturff. In 1965, when the Act was passed, Congress stipulated that signs must be paid for if they were lawfully erected and they were required to be removed. This was verified by an opinion of the Attorney General of the United States in about 1967.

In 1978, the requirement for compensation was clarified. What had happened, Mr. Lewis, was that some of the States had encouraged cities to take down signs with zoning laws, which should have been paid for under the Highway Beautification Act. So the Congress passed the 1978 amendment to stipulate that any sign controlled under the Highway Beautification Act and lawfully erected and lawfully maintained must be paid for if it is required to be removed by a State or a city, regardless of what reason the removal.

Mr. McElroy. Senator Randolph said at the time that the 1978 amendments reaffirmed congressional intent. A direct quote from his was, "it is a matter of equity."

Mr. Lewis. Was cash mentioned in the Act before 1978 amendments? I was not here.

Mr. McElroy. Absolutely. There wasn't any question whatsoever that cash was the means of compensation, just as provided in the Fifth Amendment to the Constitution.

Mr. Lewis. Mr. Chairman, if you will bear with me for another moment or two. Let's assume for a minute that it is a given when a billboard is removed, it is the United States Constitution that will require that the owner of the billboard receive just compensation?

Mr. McElroy. The Constitution does not specify the nature of the property, it simply says that when any Government entity decides to take private property for public use, it must pay just compensation. And the ruling over and over and over again, including in the most recent cases, has been that that means cash payment.

Mr. Lewis. But it is in the Constitution?

Mr. McElroy. Just compensation is clearly defined in the Constitution.

Mr. McInturff. The Fifth Amendment.

Mr. Lewis. Mr. Amos, do you feel like you are in a minority here? I notice you said your background is a planner, but I notice that the American Planning Association—I served on the Atlanta City Council as an at large member for almost five years—I notice that the National League of Cities, the U.S. Conference of Mayors, the Institute of Architects, almost all of the planners, the presidents of several of the leading banks in Atlanta and others are saying do something about controlling the proliferation of bill-

boards. I notice you make the point that the outdoor advertising industry is doing some good here and there. Could you respond?

Mr. AMOS. Yes, gladly. Let me say that the statement you made a little earlier about what you were attempting to do here in terms of changing this legislation, I think the mere fact that we from Buffalo have set a new ordinance that has been worked out, given the present laws, is an example that you do have enough regulation at this point.

To your question about being in a minority as an urban planner. No, because what I am discovering is that a lot of the comments and statements that are coming out of some of these agencies are coming from, in all deference, older representatives of these urban planning agencies and/or National League of Cities. What I am finding is the younger professionals are more mainstream and are taking a different look and approach at urban development and planning.

Mr. LEWIS. Well, the Mayor of Houston is a charming, very attractive, young woman, Kathy Whitmar, the head of the U.S. Conference of Mayors, and is supporting legislation to control billboards. We have hundreds of the young council people being elected all around the country, the National League of Cities, younger mayors. Are you saying it is a generation thing?

Mr. AMOS. I stick to my former statement. Let me just add that those younger officials or planners, who have no knowledge of this industry and what its about, once they take a closer look at it will walk away with a different opinion, we found that to be so in the City of Buffalo.

Mr. LEWIS. Do you have any concern about when little children in the heart of Buffalo, in the heart of Atlanta, or Harlem are walking through the streets each day on the way to school seeing billboard signs saying smoke up, drink up? Do you think they are at the right age to make an intelligent decision whether they should be influenced by that ad or not or that billboard?

Mr. AMOS. Your question is are they at the right age?

Mr. LEWIS. Yes. Elementary school children, six, seven, eight years old.

Mr. AMOS. Let me say the educational system plays a very important part in educating all of us; but I think even more important is the home. The values that you bring out of that environment are going to have a great influence on what you choose to do. I think regardless of what is in front of you, if that basic foundation is in place, you will not go off and do anything that you would not already do. That is my firm belief.

Mr. MCELROY. Congressman, these billboards that you refer to do not come under the jurisdiction of the Highway Beautification Act in most cases. And in most cases, they are each——

Mr. LEWIS. Well, Mr. McElroy, they may not, but it is one and the same, sir.

Mr. MCELROY. Well, I understand that and I share your concern over that. We don't want alcohol and tobacco messages on those billboards that are contiguous to schools and places of worship. We are working with local communities around the country to arrive at acceptable community standards. But I think it is important when you are talking about the entire billboard industry to under-

stand, as I said in the beginning, who we are and who we aren't. And the smaller ones that you are referring to in those inner city areas are the eight sheet billboards——

Mr. LEWIS. I live in the City of Atlanta and I have seen those six story boards.

Mr. MCELROY. That we don't represent.

Mr. LEWIS. Mr. Chairman, my last and final statement. I think this industry, if it is on some Federal supported highway or if it is in some inner city, you could take the initiative and start removing these boards or I think the American people will rise up—like they are doing in Harlem, in Dallas, in Detroit—the same way that we fought against segregation and racial discrimination, we will bring down those billboards.

Mr. MINETA. Thank you, Mr. Lewis.

Mr. Hancock.

Mr. HANCOCK. Thank you, Mr. Chairman. In the interest of time, I will try to ask only a couple of real brief questions. I think I already know the answer to one of them though.

Do any of you have any idea of how many small businesses there are that do billboard advertising? I am talking about the truly small business and we're not talking about big jumbo billboards, but we are talking about small businesses that can't afford radio or television, where they are solely dependent upon billboard advertising.

Mr. MCELROY. I think the answer to that question is that 60 percent of all the advertising that we have is from small businesses, local and retail advertisers around the country. Now of that number, the exact number that would say depend on billboards is one that we are working on. I don't want to give you a guess at this point, I would rather come up with something that is more precise because I think it is an important number. But there are a lot of businesses that depend solely on billboards. And I am thinking of an area like the Gary, Indiana area outside of Chicago. If you were to take the billboards down there, they would have to go to the Chicago media to advertise and for many, many businesses it would be simply prohibitive.

Mr. HANCOCK. So we are possibly talking about—on restriction of billboard advertising, we are talking about the loss of jobs, closings of businesses, and things more than possibly the aesthetic value of the scene that may or may not offend those people that are driving down the highway.

Mr. MCELROY. I can give you examples of businesses that have gone belly-up because they have lost their one or two signs which was the only form of advertising they had.

Mr. HANCOCK. One of the billboard type advertisements, for instance, the little hamburger stand, he can't advertise the "golden arches." You drive down the highway—and these aren't restricted, and yet they are a nationally known billboard basically. The small private individual is trying to compete in that area.

Mr. MCELROY. A logo sign is good for those who have well-known logos, but not for mom and pop operations.

Mr. HANCOCK. That's the point that I think needs to be made.

Mr. Amos, you mentioned the controls, the regulations of the number of billboards that are put up in Buffalo. How many billboard companies are operating in Buffalo at the present time?

Mr. AMOS. Presently, two.

Mr. HANCOCK. Just two companies?

Mr. AMOS. Yes, prior to Penn Advertising coming into the area, we had I think about four, and Penn came in and bought out all of those.

Mr. HANCOCK. Doesn't this basically end up with a monopolistic type of situation where Government is basically going to franchise a billboard operator? In your particular situation, wouldn't you end up at that point?

Mr. AMOS. Would we end up franchising?

Mr. HANCOCK. Well, in effect, aren't you now?

Mr. AMOS. No. I think we are benefitting from their existence.

Mr. HANCOCK. Yes, I am sure of that. But what I am saying aren't we talking a little bit here about possibly an infringement of the First Amendment, even to say that an individual can't put up a sign?

Mr. AMOS. Well, I don't think so. I think the Highway Beautification Act as it exists provided us with all the things we needed in order to develop the type of legislation we were looking for.

Mr. HANCOCK. I am aware of that, but it would just appear to me—and I am not talking about billboard companies, I am talking about an individual—the only way that he can put up a sign is to go through a billboard company, is that correct?

Mr. AMOS. Or an ad agency who would contract with a billboard company, yes.

Mr. HANCOCK. Okay, so we are talking about a little bit of an infringement here on that individual's rights. You can see where I am coming from, is the infringement of the marketplace. One of the things that we are concerned about is economic development, increasing the private sector activity, which, in turn, will increase the revenues of Governments. I notice up here pretty regularly that it seems like some of us up here in the Congress don't recognize that that's where all those tax dollars come from. So, I would just like to go on record as saying that I support, and I think the constituents in my district support, anything that we can do to promote the private sector rather than to restrict the private sector in producing those revenues, ultimately revenues for Governments.

That's all I have to say, Mr. Chairman. Thank you.

Mr. LEWIS [assuming chair]. Thank you, Mr. Hancock.

Mr. Rahall.

Mr. RAHALL. Thank you, Mr. Chairman. Mr. Chairman, I just want to go back very quickly and briefly to the very important line of questioning that the gentleman from Georgia was asking a moment ago. You, Mr. McElroy, had indicated the significance of the questioning. I just want to make sure I fully understand the entire situation.

I believe you said there are 138,000 non-conforming billboards that are still standing along our Federal Aid Highways?

Mr. MCELROY. There are 99,919, according to FHWA.

Mr. RAHALL. Okay. On Federal Aid Highways.

Mr. McElroy. Those are the figures they have supplied us and we think that number may be inflated.

Mr. Rahall. Under current law, the Federal Government now—as you were responding earlier—is to pay for 75 percent of the removal of such signs. Also under current law, non-conforming signs do not have to be removed unless the Federal funds are available for compensation, is that correct?

Mr. McElroy. That's right.

Mr. Rahall. Okay. Then I believe this is where I lost track. It is not true that Federal funds have not been available since 1984 for such compensation?

Mr. McElroy. That is my understanding.

Mr. McInturff. That is 1982.

Mr. McElroy. All right. For some time they have not been available.

Mr. Rahall. Okay. So if those Federal funds aren't available, then there is no compensation and no removal of non-conforming billboards, is that accurate?

Mr. McElroy. Well, I think a more complete answer is that of course the States could use their own funds if they elected to do so. The principle is the same regardless of whether the States use their funds or whether they wait until such time as the Congress appropriates the funds—the compensation must be paid for the removal of the non-conforming signs. Last year, 385 non-conforming signs were brought down and were paid for. An interesting statistic with that, however, is that another 4,000 signs—approximately 4,000, I don't want to be held to that—non-conforming signs came down last year through attrition and changes in land uses and through other means. So the number of non-conforming signs is continuing to drop on a regular basis even without the appropriation of new funds to pay for that.

Mr. Rahall. That's what I wanted to get at. If the Federal funds are not available, then there is really no just reason for us to expect non-conforming billboards to come down, yet there are still efforts being made to bring those non-conforming billboards down.

Mr. McElroy. By States and localities, yes.

Mr. Rahall. Okay. Just a last question, Mr. Chairman. This has been touched upon earlier, that is, the importance of billboards to small businesses and how to many struggling mom and pop operations. To them, the use of billboards is the most cost-effective means through which their product can be conveyed to the world. In many Appalachian regions of this country, such as I represent, where these small operations may be off the beaten path, it is most difficult for them to be able to be seen from the main highway. I guess this is more of a statement, but I think it is vital that many of these types of operations have available to them this kind of advertising medium, especially when they are not able to be seen from our highways. Would that not be an accurate description of the importance of billboards to them?

Mr. McElroy. Absolutely. No question about it.

Mr. Rahall. And I might add another point here. In my home State of West Virginia, a State severely financially strapped at the current time, we do have a nationwide advertising campaign underway to advertise the beauty of our State and the tourism poten-

tial that we have therein. We do not have the funds to put into an advertising budget that many States do have. We have financial constraints that prevent the State from doing this type of advertising. So billboards do fill a role as being cost-effective, and readily available to the States. I think it is important to submit for the record, that the billboard industry is of great assistance to my home State in making West Virginia America's best kept secret known to the world for our tourism potential, our snow skiing, our whitewater rafting etc.

So I just want to say that I understand the gentleman from Georgia's concerns and concerns that you share likewise about putting a message out there for our children at a very impressionable age. It is not something that we want to see done with the billboard industry. Rather, we want to see the useful and productive purposes which billboards serve continue while we try to seek a way to curb those instances where the message sent may do harm to our society. I think it is a goal that we all share on this committee.

Mr. McElroy. Thank you. I agree with you.

Mr. Rahall. Thank you, Mr. Chairman.

Mr. Lewis. I thank the gentleman from West Virginia, Mr. Rahall.

Thank you, Mr. McElroy, Ms. George, Councilman Amos. Thank you all for your testimony.

[Mr. McElroy's prepared statement appears on page 1843.]

[Mr. George's prepared statement appears on page 1749.]

Mr. Lewis. Our next panel is comprised of Mr. Louis G. Nappi, Chairman of the National Truck Weight Advisory Council; and Mr. Robert Eisenbud, Managing Director of the National Solid Waste Management Association.

Mr. Nappi, we have your testimony and it will be made a part of the record. You may summarize your statement. Thank you for staying here and being so patient during this hearing.

TESTIMONY OF LOUIS G. NAPPI, CHAIRMAN, NATIONAL TRUCK WEIGHT ADVISORY COUNCIL

Mr. Nappi. Before I begin my testimony, Mr. Chairman, and members of the committee, if it is applicable, as Chairman of the Construction Industry Council of New York, Westchester, and the Lower Hudson Valley, we wish to endorse the statement of Franklin White, Commissioner in the State of New York, Department of Transportation, and acknowledge our support for his statement.

Mr. Chairman, members of the committee, my names is Louis Nappi. I am the Chairman of the National Truck Weight Advisory Council. I am also a member of the National Academy of Science Transportation Research Board Truck Weight Study Committee, and a member of the New York State Permanent Advisory Committee on Truck Weights. I am accompanied by Larry S. Snowhite, of Mintz, Levin, Cohn, Ferris, Glovsky and Popeo, who is counsel to our organization, NTWAC. Also accompanying me from the National Solid Waste Management Association is Robert Eisenbud and Jack Legler. We have prepared statements and supplementary materials that we ask to be included for the record. In addition,

members of our organization will be submitting statements that we ask be included as part of the NTWAC testimony.

Mr. LEWIS. Without objection, it will be included.

Mr. NAPPI. In deference to the time, the lateness of the day, we have chopped off about 50 percent of our presentation.

Mr. LEWIS. We appreciate it.

Mr. NAPPI. Hopefully, we can get our message across with the limited amount of time that we have left to us.

Our message is that specialize hauling vehicles, called SHVs, have unique problems in complying with Federal weight laws, particularly the bridge formula, without sacrificing safety and productivity.

States should be allowed to adopt voluntarily a special permit program for SHVs that would enable them to operate productively within the safety and maintenance design specification of the Interstate Highway System, in lieu of compliance with the current Federal truck weight requirements. Current Federal law limits the weights and axle spacing of trucks operating on the Interstate Highway System unless a State qualifies for an exemption under the grandfather clause. Each State has the authority to set size and weight standards for all other highways within its jurisdiction. Trucks are, in effect, rewarded under current law with additional allowable weight for increased number and spacing of axles.

Application of this policy to trucks that are specialized hauling vehicles, however, is counterproductive because of the unique design and operating characteristics of the SHV.

It is important to keep in mind that all trucks are not the same. Specialized hauling vehicles are different from 18-wheel tractor-trailers and longer combination vehicles. SHVs are trucks used for hauling heavy bulk materials; typically, they are garbage trucks, concrete mixers, dump trucks, roll-off container trailer combinations. They carry such dense heavy materials as solid wastes; scrap and recyclable materials; ready-mix concrete; and sand, gravel, and crushed stone. Nation-wide, the number of trucks that could be considered to be SHVs is at most about 250,000 or about 14 percent of the largest weight classes (Classes 6, 7, and 8); the number of trucks for which permits would be issued would be far fewer than that.

SHVs share certain common characteristics. SHVs have heavy tare, or empty, weights, attributable to structural design or specialized equipment installed on the vehicle for handling the heavy load. For example, when empty, a three-axle ready-mix concrete truck weighs approximately 35,000 pounds. The materials hauled generally cannot be diverted to rail or other transport. SHVs generally operate for short distances and are empty for one direction in a round trip.

SHVs require short wheelbases in order to maneuver safely at construction sites, on city streets and alleys, at facilities with limited clearance, and at off-road locations. Because of their short wheelbase, the maximum legal weight for SHVs is usually determined by the Federal bridge formula rather than by gross weight limits.

Taking together the heavy tare weight and short wheelbase, both of which are necessary to do the job that these trucks are built to

do, the result is that SHVs cannot meet Federal truck weight standards, particularly the bridge formula, without sacrificing safety and/or productivity. One consequence of complying with the bridge formula by operating at lower payloads is that a typical three-axle SHV, with a wheelbase of 16.6 feet, which when empty weighs 30,000–35,000 pounds; when carrying a payload can weigh a total of 48,000 pounds when operating on the Interstate System which is the only System to which the bridge formula applies as a matter of Federal law. Thus, SHVs can carry only 13,000 pounds of payload, even though the manufacturer has built this truck to be able to safely carry loads substantially greater than currently allowed.

Current Federal law in effect lessens the productivity of SHVs by virtue of their being what they are.

What are the practical consequences of these restrictions on SHVs? It means that it takes three or four trucks to carry the same payload that could be carried safely in only one truck if it were not subject to the bridge formula. It means that there are three or four trucks, each weighing 35,000 pounds, returning empty after delivering its load, compared to one truck weighing 35,000 pounds that could be used for the same job. It means that there are more trucks consuming more gasoline, causing more congestion, contributing more air pollution, and increasing the risks of accidents, than is necessary. It means that requiring SHVs to operate within Federal limits on the Interstate System forces SHVs to bypass the Interstate System, travelling instead over State and local roads and bridges that are built to lower standards than those for the Interstate System. It means that manufacturers have to build many different types of trucks with many different options to enable an SHV to be operated productively while beating the bridge formula. All this increases the cost of manufacturing, purchasing, and operating an SHV. That means increased costs of transporting waste for recycling and resource recovery and Superfund type clean-ups. And it means increased costs of building roads and bridges because the cost of transporting the building materials is increased by unproductive weight limitations.

It makes no sense to limit the design of tomorrow's trucks to the road and bridge designs standards of over a half a century ago. If we were to compare our truck weight policy with that for planes, if we were to design today's planes by the runway design standards of the 1940s and 1950s, we would not have 747 or DC–10s. All planes would be the size of a DC–3. We would need six DC–3s to carry the same number of passengers as one 747; or else we would be requiring jumbo jets to have so many landing gears that they would weigh as much as the plane, as illustrated on page six of our testimony.

Is there a better way that will meet our industry's need for greater productivity that will also ensure that roads and bridges and the public safety is protected? As an alternative to requiring SHVs to comply with current Federal weight limitations, NTWAC is proposing that States should be authorized to be able to adopt—voluntarily—a permit program for specialized hauling vehicles that would be in lieu of current Federal requirements and without regard to grandfather clause status. It would allow SHVs to oper-

ate productively on the Interstate Highway System and most of the rest of the Federal Aid Highway System within the safety and maintenance design specification of these highways. The NTWAC proposal incorporates a standard now used by several States in issuing permits. It is consistent with the AASHTO-specified basis for issuing permits to heavier-than-normal vehicles, and with the FHWA's basis for reporting structural deficiencies of bridges. As the Nation appears ready to resume the task of rebuilding our infrastructure for the future, that task will be helped by a reasonable truck weight regulatory system for the trucks that will be used to build that infrastructure. I will add more to this.

[The following was subsequently received from Mr. Nappi:]

Specifically, NTWAC proposes that SHVs would be authorized under Section 127 to operate on the Interstate Highway System under a state-issued permit that complied with the following basic elements:

(1) Specialized Hauling Vehicles (SHVs) are defined to include single or combination ready-mix concrete mixer trucks, solid waste compactor trucks, and dump, lugger, and roll-off trucks when used for the transportation of construction materials, solid waste or hazardous waste, or scrap metal and other recyclable scrap materials.

(2) allow the operation of SHVs at gross and axle weights that do not exceed the lesser of (a) the manufacturer's certified gross vehicle rating or (b) 75 percent of the yield stress, i.e., the operating rating, calculated on an HS 20 bridge (if the SHV does not exceed 55 percent of the yield stress, i.e., the design rating, of an HS 20 bridge, no permit would be needed).

(3) restrict the routes over which permit vehicles may operate safely;

(4) post and/or limit the operation over bridges which cannot safely accommodate permit vehicles;

(5) establish a fee structure for permits that will be adequate to cover increases in highway agency costs and any administrative and enforcement costs resulting from permit vehicles; and

(6) establish an effective enforcement program which should include measures to assure safe operation and compliance with permit provisions.

Mr. NAPPI. Permit programs consistent with NTWAC's proposal are being reviewed in several states (in accordance with their grandfather clause authority), for example, New York State has adopted a successful permit program initiated in 1986, which was endorsed by the Department of Transportation and industry and approved by the FHWA. Industry compliance has resulted in releasing enforcement authorities to concentrate on safety issues, drug abuses, and other important issues.

NTWAC has made what we believe to be a very constructive and responsible proposal that would apply to a very small and limited class of vehicles in lieu of the current Federal truck weight requirements. NTWAC requests that Congress authorize any State to be able to adopt the permit program for specialized hauling vehicles regardless of grandfather clause status, so long as it meets minimum Federal standards to assure protection of pavements and bridges, safety, and enforcement. The permit program proposed by the National Truck Weight Advisory Council meets this criteria and should serve as a foundation for Congress' effort.

I would like to take this opportunity to thank the committee for the opportunity to express our views, and to say to you that we will continue to offer our views and assist and cooperate to the fullest extent in the program.

Mr. LEWIS. Thank you, Mr. Nappi.

Mr. Eisenbud, you may proceed.

TESTIMONY OF ROBERT EISENBUD, MANAGING DIRECTOR, NATIONAL SOLID WASTES MANAGEMENT ASSOCIATION, ACCOMPANIED BY JOHN A. LEGLER, DEPUTY DIRECTOR, EQUIPMENT/RISK MANAGEMENT

Mr. EISENBUD. Thank you, Mr. Chairman. In a similar effort, I will abbreviate my prepared statement considerably in the interest of time. I would like to say that Mr. Allen Moore, President of National Solid Wastes Management Association, who had been invited to testify, was unable to do so. He asked me to convey his regret and apologies, and I am very grateful for the opportunity to present his testimony in his stead. I have with me Mr. Jack Legler, who is the Deputy Director of Equipment and Risk Management for the Association.

The National Solid Wastes Management Association is a trade group which represents approximately 2,500 private waste service companies. Of the approximately 250,000 vehicles involved in his SHV category, it is probably the case that some 140,000 are involved in waste services—that is, the collection and transportation of waste. This issue is of particular concern to us for that reason.

I would like to use the brief time that I am going to take for purposes of pointing to a particular example of the SHV problem. I have provided some photographs to you that illustrate this problem vividly. Those photos show a commercial front-load truck. They also illustrate the kind of challenges drivers face many times a day. If you look at those photos and imagine that you are a driver, you can probably appreciate how impossible it would be to get in and out of that situation in the tight quarters that are depicted if the truck were, let us say, five or six feet longer. You will also be able to note that there is really no place to put another axle that would not interfere with the hydraulic lifting or the body dumping equipment that is necessary for those vehicles to operate effectively.

The truck in that example pictured there has a gross vehicle weight rating of 64,000 pounds, and an empty weight of 34,000 pounds. The payload which that truck is designed to carry is 30,000 pounds. All of those figures are in full compliance with Federal safety rules and regulations. Under the Federal bridge formula, it can only operate at 49,000 pounds and be legal on Interstate Highways. That means that it can really only operate at 50 percent of its payload capacity, because its full payload capacity would be 34,000 empty weight plus 30,000, and it can only carry 15,000, half of its capacity.

That truck has an impact on a standard HS-20 bridge of 50 percent of that bridge's rating capacity. In other words, both from the payload standpoint and from the standpoint of the bridge, operating the truck under the bridge formula is a totally inefficient operation.

We support the NTWAC proposal that was outlined by Mr. Nappi. We have been pleased to participate in that effort for more than ten years. We think that it doesn't make sense to run a vehicle inefficiently with adverse impacts on safety, on air pollution, and on the overall effectiveness of the waste services operations.

We are not asking to violate any design criteria or safety considerations. What we are asking for is relief from a really archaic and unworkable formula, which is really a Federal barrier formula rather than a bridge formula. It no longer reflects the concerns for assuring no damage to bridges. It really serves only as a barrier to the effective movement of waste and other things that really constitute another part of the infrastructure, just as much as the highways are a part of the infrastructure.

Mr. Chairman, I won't take any more time. If you have questions, we would be pleased to try to answer them.

Thank you, Mr. Chairman.

Mr. LEWIS. Thank you very much, Mr. Eisenbud.

Let me just ask one or two questions. Vehicle weight limitation on the Interstate System applies to all segments of the trucking industry. Would an exemption to the Federal weight limit for specialized hauling vehicles provide a competitive advantage to only a certain segment of the trucking industry?

Mr. NAPPI. No. The materials carried generally must be hauled in a SHV. The type of vehicle that you are going to use, for which we are asking for these permits, are specialized pieces of equipment, so they would not compete with the other trucks in other phases of the trucking industry, or with railroads.

Mr. LEWIS. The existing bridge formula is calculated to protect bridge structures. Does the trucking manufacturer industry have capability to manufacture a vehicle that will comply with the bridge formula and have a lower tare weight for specialized hauling vehicles?

Mr. NAPPI. Mr. Chairman, one of the things that we are very much concerned about is the Rube Goldberg type of truck that can be manufactured in order to circumvent the weight laws, the Rube Goldberg type of vehicle that is modified so that it has unnecessary axles, which contribute to concerns over safety and additional wear of the roads and bridges. We don't propose to endorse those types of vehicles. We find that the safety of the public is of uppermost concern in our consideration of the truck weight laws.

We have also hired independent engineering firms to calculate for us that the weights that we want to carry on these SHVs do not violate the standards to safely carry these loads over these bridges. We have hired Seely, Stevenson, Value and Knecht, an engineering firm, that analyzed our SHV proposal based on the live load moment standard, and concluded it safely allows us to carry loads between the 55 percent and 75 percent of yield stress that a bridge is designed to carry. I want to point out that some trucks can comply with the bridge formula while exceeding the allowable live load stress. So we are not looking to violate safety or protective standards or carry any more on our trucks than the bridge is designed to carry. And we are not looking to create—as you have seen in the example, if you have had an opportunity to look at it—a caterpillar type of truck with a myriad of axles to beat the weight laws. We consider these counterproductive to the safety of the public and also counterproductive considering the added costs that would be required of the manufacturers in order to build a truck of that sort. Lighter trucks, with lower tare weights, cannot

safely and practically carry the heavy materials required to be hauled in an SHV.

I hope that answers your question.

Mr. LEWIS. I appreciate it. Mr. Nappi, could you explain to the committee, at least to me, the impact that this specialized hauling vehicle would have on the pavement if it is exempted from the bridge formula.

Mr. NAPPI. The impact on the pavement, we have had considerable discussion about that also in the TRB study that we are just trying to conclude. With 16 prominent engineers and scientists who are members of this committee, we could not come up with a consensus of opinion on what the impact of the SHV was on pavement. The consideration there is that the ESALs, which are a determining factor as far as pavements are concerned, have various factors which contribute towards the wear and tear of the pavement—subbase, weather, conditions of that sort. There are too many factors involved. So the committee of learned people of 16 scientists couldn't come up with an equitable answer.

Answer. As we state in our prepared testimony, we believe the pavement impact model overstates damage. Further, what minimal damage that fairly may be allocable to SHVs is compensated for by the fewer trucks needed to carry the same payload and the greater productivity attributable to an SHV permit program, including lower construction costs that will make highway construction dollars go further.

Mr. LEGLER. Sir, I think one thing that is important to mention is the Cornell University study of the New York permit system. One of the scenarios that was looked at was what would happen should New York go back to the strict bridge formula compliance. It is principally a function of the heavy tare weight of the vehicle, which is something that is not really negotiable because it essentially is an engineering requirement that derives from the use of the vehicle and the environment it has to operate in. Believe me, people have tried over the years and not very successfully. One of the things that came out of that study, because you are running so many more trucks with such heavy tare weights empty, you end up at about a wash on net road impact in total ESALs. It was as I recall less than 1 percent difference between the two.

Mr. SNOWHITE. Mr. Chairman, it is also important to point out that the SHV permit program and weight limits that are being proposed is in place in many States now. More than one-half of the States allow weights off the Interstate that are higher than are allowed on the Interstate System and don't require compliance with the bridge formula. Many States have permit programs under which SHVs generally are allowed to operate at higher weights. New York has such a permit program. And the States that have these permit programs have been quite satisfied with them. They found that there are many, many benefits that far outweigh whatever adverse effects, which really have not been quantified.

I am sure in your experience you have been exposed to all the debates on the different causes of pavement deterioration. I don't think that anyone is ever going to finally resolve how much damage is done by what kind of vehicle. I think what we are trying to say is that SHVs are unique vehicles; they are limited by the bridge formula and Federal weight limits in a way that doesn't affect other trucks. The 18-wheeler, the LCVs generally are not

constrained by the bridge formula or weight limits because they cube out, their allowable volume is exceeded before they reach any weight limitations. So you are dealing with a very small number of trucks that because of their functionally-related unique characteristics have a problem practicably complying with current federal law.

To allow the States to provide relief for SHVs is not going to open the flood gates because there aren't that many vehicles that are going to need this relief. Secondly, through the permit program, there is a real cost that is associated with obtaining an SHV permit that acts as a further constraint. A permit won't be sought unless truly needed. For example, New York State's average fee is over $500 for a permit; New York State raised over $12 million in permit fees. There are conditions that have been imposed. New York State, again as an example, requires extra financial responsibility as a condition of getting a permit. Thus, there are safety benefits associated with a permit. It is a way for the State to say, all right, we are basically trying to create a "win-win" situation.

As far as the pavement impacts, using the conventional way of calculating pavement impacts, New York State found that they were minimal. There is also a benefit in road construction because the cost savings can be passed on through lowered concrete and road materials. The studies generally don't take into consideration, as has been pointed out, that we are substituting one or two trucks for four trucks. It is the empty weight, the 35,000 pound tare weight, that is the most significant factor. So you have one permit truck instead of four trucks, reducing permit-related impacts. Recently, to point out another environmental benefit, California was proposing limits on the hours of operation of trucks as an air pollution control measure. We NTWAC is proposing to decrease the number of trucks needed to carry the same payload, while will reduce emissions.

[Mr. Nappi's prepared statement appears on page 1864.]

[Mr. Eisenbud's prepared statement appears on page 1743.]

Mr. LEWIS. Thank you for your testimony and for your statements. And thank you again for being so patient.

If there are no other questions, the Surface Transportation Subcommittee will stand adjourned.

[Whereupon, at 6:38 p.m., the subcommittee was adjourned, to reconvene at the call of the Chair.]

PREPARED STATEMENTS OF WITNESSES

NATIONAL
ASSOCIATION
of
COUNTIES

440 First St. NW, Washington, DC 20001
202 393 6226

STATEMENT OF

THE HONORABLE BART BARKER

COUNTY COMMISSIONER

SALT LAKE COUNTY, UTAH

AND

CHAIRMAN OF THE TRANSPORTATION STEERING COMMITTEE

OF THE NATIONAL ASSOCIATION OF COUNTIES

ON

REAUTHORIZATION OF THE

FEDERAL-SURFACE TRANSPORTATION PROGRAM

BEFORE THE

SURFACE TRANSPORTATION SUBCOMMITTEE

OF THE

HOUSE PUBLIC WORKS AND TRANSPORTATION COMMITTEE

ON BEHALF OF

THE NATIONAL ASSOCIATION OF COUNTIES

TUESDAY, APRIL 24, 1990

WASHINGTON, DC

Mr. Chairman,

My name is Bart Barker. I am a County Commissioner in Salt Lake County, Utah, and chairman of the National Association of Counties Transportation Steering Committee. On behalf of the Association, I want to thank you for inviting me to appear today before the House Surface Transportation Subcommittee to discuss the reauthorization of the federal highway and mass transit programs.

For the last year and a half, members of the Transportation Steering Committee have been working on developing policy on the future of the surface transportation program. A policy statement and resolution were approved by the NACo Board of Directors on March 18, 1990, during our Legislative Conference. (see Attached)

---

*The National Association of Counties is the only national organization representing county government in the United States. Through its membership, urban, suburban and rural counties join together to build effective, responsive county government. The goals of the organization are to: Improve county government; act as a liaison between the nation's counties and other levels of government; achieve public understanding of the role of counties in the federal system.

Completion of the Interstate system has driven national surface transportation policy for the past thirty years. The system is now essentially completed with the exception of a few gaps. The resources that have supported this massive public works undertaking may now be directed toward other national transportation priorities. Defining the appropriate Federal role in the "post-interstate" era will be a critical process. It will affect every citizen and every level of government, and will help to determine our nation's ability to compete in a global economy.

The new surface transportation program must make economic development of our urban, suburban, and rural areas the key factor in making transportation decisions. The economic health, vitality and competitiveness of our Nation is being threatened by increasing urban/suburban congestion and failure to meet the access needs of rural areas. Congestion adds billions of wasted dollars to cost of moving goods, services, and people in urban and suburban areas. In our rural communities, underinvestment in highways and bridges, and the resulting deterioration, make it more expensive to move commodities and discourages new economic activity. These are issues of national concern and we hope that Congress will view them as such when considering various proposals to establish a new surface transportation program.

INTERGOVERNMENTAL PARTNERSHIP

As this Subcommittee begins to consider what a new Federal-aid program might look like, NACO urges you to look closely at the intergovernmental aspects of the program. We believe it is time for this program to become a true Federal-State-Local program.

Local elected officials must have a stronger role in establishing transportation funding priorities and in selecting projects which meet both national and local goals. Local officials have been involved in such decisions under the federal transit program and the process has worked well. This has not been the case with the federal-aid highway program, where many states have been resistant to including local governments in highway decisions.

While the Interstate system is about to be completed, urban congestion problems worsen and rural areas see little if any improvement in the conditions of their roads and bridges. In order to remedy this situation, new legislation must include local government officials as equal partners in the federal-aid highway program. A mandatory and statutory process must be created to ensure that local elected officials are consulted and their views fully considered as planning, funding allocation,

and project selection decisions are made on the use of federal-aid highway funds. We would be happy to work with the Subcommittee and state officials to work out this new relationship. We know this will require a somewhat different perspective by federal and state highway officials, but it seems almost unthinkable to try to address our future national transportation priorities without requiring local input.

SURFACE TRANSPORTATION PROGRAMS

We believe that an urban-suburban mobility program must be created, replacing the FAUS program. It would be directed at solving congestion and mobility problems in urban and suburban areas and would receive substantially more funds that the FAUS program. These funds would be passed through to areas in excess of 200,000 population and, at the option of local officials, could be spend on mass transit. Counties are in an excellent position to understand and undertake surface transportation projects aimed at addressing the mobility needs of their residents. The larger counties have both the planning and engineering expertise to carry out these projects without direct state highway department involvement.

Salt Lake County is facing serious congestion problems. More that $1.1 billion worth of transportation needs confront my county in the next five years. The $2.9 million we receive from the Federal-aid Urban program just doesn't go very far in addressing our current and future needs. In addition, as the major urban county in a rural state, our staff is more than qualified to be able to handle additional federal highway funds that might come through a new urban-suburban mobility program. In fact,we are probably more qualified that the State DOT to understand the needs and perform the work.

A rural access program must be created, which would fund the secondary road program (FAS) at a higher level. Good secondary roads that provide access to Interstates and primary roads are key factors to the revitalization of America's rural areas and to the agriculture, logging, mining and tourism industries. However, our nation's rural secondary highways have for the past thirty years received the least attention from the federal government of any system and their condition reflects this low investment level. Roads designed to immediate post-World War II standards are carrying vehicles with gross weights in excess of 100,000 pounds. Railroad abandonment has moved goods off the railroads onto trucks.

This program would continue to be administered by the states, with guarantees of strong local government input in the allocation, planning and project selection process. Another option would be for a consortium of rural counties to enter into an agreement that would allow them to receive funds directly from the federal government.

The condition of bridges in general, and of county bridges in particular, should be a national concern. The statistics are well known to Subcommittee members. With 165,000 county bridges in substandard condition, one can understand NACO's strong feelings about this program. We recommend strongly that the bridge program (HBRRP) retain its separate identity. The rehabilitation of our nation's bridges is too high a priority item to be folded into a block grant or a so-called flexible program. Additionally, it should be funded at a higher level and a greater percentage of the funds dedicated to off-system bridges.

NACo supports the creation of a unified 4R/primary program, which would provide federal funds to maintain and upgrade the Interstate and primary systems. After investing billions of dollars in the Interstate and primary program and with the completion of the Interstate system, we believe it makes sense to

protect our investment. We do, however, believe that emphasis should be placed on those sections of the Interstate and primary systems where expansion and rehabilitation also address the congestion problem.

The mass transit program would retain its separate identity. However, more flexibility should be given to the recipients of transit funding in regard to how they would spend their allocations---we should not force systems to use capital money to make investments they do not need when these systems would be better served using federal money for operating expenses such as maintenance. NACO also believes that most if not all of the transit program ought be to funded with a dedicated source of revenue. The battles of the last seven years over the level of general fund financing have distorted transit funding decisions.

FINANCING A NEW SURFACE TRANSPORTATION PROGRAM

Financing the new surface transportation program is central to its formulation. NACO supports the following guidelines or principles: First, the federal surface transportation program should be user-fee-based to the extent possible. Second, all

levels of government should increase funding for surface transportation programs. Third, there is a substantial balance in the highway and mass transit trust funds and this issue must be addressed in reauthorization legislation. This balance of almost $18 billion should be spent down and in the future all trust fund revenues and accrued interest should be allocated in a manner the reflects the spirit and intent that accompanied the establishment of the trust funds.

Now comes the key question of assigning funding levels to the separate highway programs. NACo believes it has come up with a very fair and equitable approach. In the new highway program, the baseline for all current Federal-aid highway programs, with the exception of the Interstate construction program, which is eliminated, should be no less than currently authorized under existing law. The bridge program would receive $1.6 billion, the urban/suburban mobility program $750, rural access program $650 million, and the Interstate 4-R/primary $5.1 billion.

The $3.0 billion presently being used for Interstate construction should be reallocated in the reauthorization legislation. No less than 50 per cent, or $1.5 billion, should be allocated to the urban/suburban mobility, rural access and bridge programs. The new Interstate 4-R/primary program would receive the remaining funds. This process or formula would guarantee additional federal funds for local government highway

and bridge projects, while ensuring that there are adequate funds to rehabilitate and upgrade the interstate and primary systems. In addition, any new funds that become available to the highway program, such as new gas tax authority would be allocated according to the following formula: 1/3 to the Interstate 4-R/primary program and 2/3 to the urban/suburban mobility, rural access, and bridge programs.

As stated earlier, transit should continue to receive 1 cent from the gasoline tax. In addition, an increase in the gasoline tax should be sought to replace the general fund allocations in order to ensure a dependable source of revenue.

Finally, in the area of finance, let me comment on the proposals to increase the match requirements. Local governments cannot be expected to increase their commitment to the federal program without a commensurate increase in the federal commitment. Counties already fund over fifty per cent of their highway budget with property taxes and other local, non-user-fee money. Only local government has made such a general fund commitment. Local governments already match every federal dollar with three local tax dollars. It must be also recognized that financial resources of many county governments are limited by both by the absence of a tax base and by state imposed limits on their ability to raise and/or impose additional taxes.

I would be remiss if I did not comment on two areas where our members believe there is an appropriate federal role. First, the federal government has taken, and should continue to take, a lead role in highway safety. Second, there is an appropriate role for the federal government in research and development/technology transfer for both the highway and transit programs. The evolution of the T-2 program during the last ten years has proven to be an excellent mechanism for transmitting rapidly expanding technological information to local government agencies.

Mr. Chairman, this completes my testimony. I would be glad to answer any questions from members of the Subcommittee. Once again, thank you for inviting NACO to testify.

NATIONAL
ASSOCIATION
of
COUNTIES

440 First St. N.W. Washington, D.C. 20001
202/393-6226

Statement of the National Association of Counties

on the

Future of the Surface Transportation Program

Approved by Board of Directors

March 18, 1990

This statement was originally prepared by a Post-Interstate Task Force appointed by the chair of NACo's Transportation Steering Committee. It was approved as an interim statement by the Steering Committee in July, 1988. In December, 1989 the leadership of the Steering Committee met to put this statement into final form and to draft the accompanying resolution. Both were presented to the Steering Committee at the Legislative Conference for consideration and were approved on March 17, 1990. The NACo Board of Directors gave their approval on March 18, 1990.

The National Association of Counties (NACo) views the process of developing a comprehensive national program for the future of our transportation system as an important task. Secretary of Transportation Skinner recently issued the National Transportation Policy which we expect will create a national debate on the issue. Counties own and maintain 1.7 million miles of roads or 43 percent of the total mileage in the United States; 208,000 bridges over 20 feet or 51 per cent of the bridges on the National Bridge Inventory; and own or contribute funding to 25 percent of the public transit systems. The role of the federal government in this post-Interstate era will be a crucial one as those decisions made at the federal level will most certainly impact the mobility and funding questions county officials must address at the local level. While the focus will be on surface transportation because of the reauthorization process in the highway and mass transit program, aviation and railroad issues are important to counties and are addressed in other NACo documents.

Basic Premise

The 43,000 mile Interstate system will be completed in 1991. County officials have supported the construction and completion of this system which has been done almost entirely with federal funds. They supported the Interstate program and investment in the primary system because it was necessary to link the various regions of the country. However, it is now time to change the emphasis of the surface transportation program and to treat local governments as equal partners. While NACo supports continued involvement by the federal government in funding some rehabilitation of the Interstate system, it is now time to allocate a greater portion of there sources of the federal highway trust fund to other systems.

Economic development needs to be a key factor in making transportation decisions in the future. The national and regional implications of such actions must be studied closely. Rather than simply measuring traffic or ridership, we must make decisions based on strengthening our economy and making our goods and services competitive on an international as well as national level. The competitiveness of American goods is undermined by not investing in highways, bridge and public transit--bad roads add

costs to American products. The choke points of our economy are in our suburban and rural areas. In suburbia, congestion adds billions of wasted dollars to the cost of moving goods, services, and people. In our rural areas under investment in highways and accelerated deterioration of these same roads make it more expensive to move commodities and discourages new economic activity. Consideration also needs to be given to the implications of transportation related decisions that may result in the development of one area at the expense of another.

Urban/Suburban Congestion

The movement of people and goods and services in urban and suburban areas is reaching a crisis stage. While it is a problem having national implications, congestion is a local concern whether it occurs on county or state roads or on an Interstate highway servicing an urban or suburban area. The Interstates, though constructed to link the nation with a good highway system, have become part of the local road network in many areas with 70 per cent of Interstate traffic now being local in nature. To the highway user it makes little difference who has responsibility for a highway system if that system is congested and not serving the needs of the local public and business community. A revised surface transportation program must consider the new development patterns in suburban counties and the implications of that growth on the ability of citizens to move around with as few constraints as reasonably possible. Such a program must also address the needs of the older urbanized areas which have suffered population decline and may have less ability to pay for improved roads and transit services, while at the same time having areas within them which are experiencing revitalization and growth and thereby generating severe traffic congestion. Both highways and transit need to be considered as solutions.

There is no question that land use planning must be given a high priority as we devise new solutions and develop new programs to solve our growing congestion problem. We must also acknowledge that congestion contributes to a decline in air quality due to auto emissions and the deterioration of road surfaces and that the protection of our environment is an issue which is linked to future surface transportation policies.

Rural Access

Good secondary roads and bridges in rural areas that provide access to Interstates and primary roads are key factors to the revitalization of America's rural counties and to the agricultural, logging, mining and tourism industries. However, our nation's rural secondary highways have for the last thirty years received the least attention from the federal government of any system and their condition reflects this low investment level. Additionally, a substantial number of rural bridges are considered deficient and may represent a danger to public safety. This is ironic for it was the rural farm-to-market system which was the initial reason for the federal government involvement in a national highway program.

While basic maintenance has and should continue to be the responsibility of county government, federal funding for construction and rehabilitation of highways and bridges must grow substantially. The design and capacity of many rural highways and bridges are based on traffic needs of the immediate post-World War II period. The number of trucks and other heavy equipment using these roads has been expanding and more important the weights of such vehicles has increased considerably. It is not uncommon to find trucks with a gross weight in excess of 100,000 pounds using rural roads. This increases the rate of deterioration and requires a substantially heavier investment in reconstruction to adequate standards. Railroad abandonment, which must be reversed, has moved goods off the railroads onto trucks. In 1947 there were 214,000 miles of rail roadway which then dropped to 196,000 by 1971 and to 140,000 in 1986.

A New Surface Transportation Program

The following is a list of categories which would be eligible for funding under the new highway and mass transit program.

4-R/Primary Program

--This program would provide federal funds to maintain and upgrade the Interstate and primary systems. However, emphasis should be placed on those sections of the Interstate and primary systems where expansion (extra lanes, for example) and rehabilitation will lead to addressing the congestion problem in urban and suburban areas.

Urban/Suburban Mobility Program

--Funding for the urban system program should be increased substantially and be directed at solving congestion and mobility problems particularly in the larger urban areas and high growth suburban areas. This program should be used to upgrade existing county highways and where appropriate, state highways, in order to relieve traffic on the Interstate system. This program could also be used for building new routes to carry increasing traffic. At the option of local government officials, these funds could be spent on public transit.

States would administer the program in consultation with local government and/or metropolitan planning agencies where appropriate for urbanized areas between 5,000-200,000, while the funds would be passed-through to counties and other local governments in area above 200,000 population. NACo considers this pass through to be a key component of the future transportation program. Counties are in an excellent position to understand and undertake surface transportation projects aimed at addressing the mobility concerns of their residents. Larger counties have both the planning and engineering expertise to carry out these projects without direct state highway department involvement. In states where local government has little or no transportation responsibility, funds would be spent by the state with consultation required with local government officials on project selection.

Rural Access Program

--This program would be directed toward the upgrading, through the substantial increase in funding, of what is now known as the secondary road program. It is essential that rural roads be improved so that they can carry the much heavier loads of today's vehicles and so that they can serve as a link to the Interstate system and to various markets for the agricultural, logging, mining, manufacturing, and tourism industries. The high operating costs to these industries associated with poor roads and in turn the cost to the economy as a whole makes the condition of rural roads a national responsibility. Economic development in the future will be accelerated or restricted depending on how aggressively our nation upgrades the secondary road system.

This program could continue to be administered by the states with guarantees of strong county input in the allocation, planning, and project selection process. Another option would be for a consortium of rural counties to enter into an agreement which would allow them to receive funds directly from the federal government.

On roads assisted through this program, state design, environmental, and other regulatory standards would be applied. It is an inefficient use of federal funds to apply federal standards to rural roads.

Small bus and van transit systems are being used increasingly in rural areas, especially by special need groups like senior citizens. Such programs should also be maintained and expanded.

Bridge Program

--The highway bridge replacement and rehabilitation program would remain a separate program. The large backlog of substandard bridges remains at a critical level and a large capital investment is required to rehabilitate and replace these bridges. Counties are responsible for a substantial percentage of both the nations' bridges and those which are classified as either structurally deficient or functionally obsolete. It is important that the percentage of the program dedicated to off-system bridges be increased.

Public Transit

--It is the intent of NACo that the transit program retain its separate identity. Transit will not succeed without a significantly increased federal subsidy, in some cases to initiate a local program and in some cases to operate it. Like the automobile owner, the transit user is entitled to a reasonable subsidy.

More flexibility should be given to recipients of federal transit funds in regard to how they can spend such funds---we should not force systems to use capital money to make investments they do not need when they would prefer to use federal money for operating expenses such as maintenance. We would also like to see transit with a dedicated source of funding such as the federal gas tax. The battles of the last seven years over the level of general fund financing have distorted the funding decisions of that industry.

Financing a New Surface Transportation Program

Financing the new highway and transit program is central to its formulation. NACo supports the following guidelines or principles.

User fees

--The federal surface transportation program should be user fee based to the extent possible. The source of these user fees should continue to be the gasoline and diesel fuel taxes and the various other vehicle related taxes. All funds generated by these user fees should be dedicated to transportation and not used for deficit reduction. There should not be a turn back to the states of any of the federal gas tax authority.

Increased investment

--All levels of government should increase funding for surface transportation programs with an emphasis on dedicated sources of revenue.

Trust funds

--There is a substantial balance in the trust funds---this balance should be spent down and in the future all trust fund revenues and accrued interest should be allocated in a manner that reflects the spirit and original Congressional intent that accompanied the establishment of the trust funds. The spend down for the highway and transit trust funds should proceed along the following schedule:

HIGHWAY ACCOUNT	TRANSIT ACCOUNT
FY 1991 - $2.7 billion	FY 1991 - $2.5 billion
FY 1992 - $2.5 billion	FY 1992 - $2.5 billion
FY 1993 - $2.5 billion	FY 1993 - $2.0 billion
FY 1994 - $3.0 billion	

Highway program

--In the new highway program, with the exception of Interstate construction which is eliminated, the baseline for all programs should be no less than currently authorized under the existing highway program:

Bridge - $1.6 billion
Urban/ Suburban Mobility - $750 million
Rural Access - $650 million
Interstate 4-R/Primary - $5.1 billion

The $3.0 billion presently being used for Interstate construction should be reallocated. No less than 50% or $1.5 billion should be allocated to the urban/suburban mobility, rural access, and bridge programs. The new Interstate 4-R/primary program would receive the remaining funds. This process will ensure additional federal funds for local governments.

Any new funds which become available to the highway program, i.e. funds from a trust fund spend down or from new gas tax authority, must be allocated on the following formula: 1/3 to the Interstate 4-R/primary program and 2/3 to the urban/suburban mobility, rural access, and bridge programs.

Public transit

--The national public transit program should no longer be funded from the federal general fund. The current one cent from the federal motor vehicle fuel tax now allocated to the Transit Account in the Highway Trust Fund should be augmented, without adversely affecting current and future highway funds, by a share of a new motor vehicle fuel tax to: 1) replace the current federal general fund assistance, and 2) add funding to assist local governments in the completion, upgrade and operation of our national public transit systems.

Match requirements

--Local governments cannot be expected to increase their commitment to the federal program without a commensurate increase in the federal commitment. Local governments already match every federal dollar with three local tax dollars. It must be also recognized that financial resources of many county governments are limited by both absence of a tax base and by state imposed limits on their ability to raise and/or impose additional taxes.

Bond financing

--Tax exempt bond funding should be available for highway and mass transit projects with a minimum number of restrictions.

88-258 O—91——55

Planning/Decisionmaking Process

County support for continuing and increased federal funding in surface transportation depends on a strengthening of the federal-state-local relationship. This is true particularly for the federal-aid highway program which has not had adequate local government input. The vast amount of travel in this country is local in nature and the concerns which NACo believe need to be addressed in the post-Interstate era, i.e., congestion, rural access, and economic development, require solutions which must involve local governments.

The states have traditionally been the focal point for most federal highway funds. It can be stated fairly that fifty different systems of funding and planning exist in terms of what approach states use in the allocation of federal highway funds. New legislation should include local officials as equal partners with state officials in the decisionmaking process. The future federal transportation program should not impose a uniform decisionmaking process on all states. It should, however, recognize the degree to which county road needs exist and that these needs must be addressed in an equitable manner. A process must be created by any new surface transportation legislation to ensure that local government officials are consulted and views considered fully as funding and project selection priorities are established within a state.

Other Issues

Mandates, safety and research and development/training are other subjects which must seriously be considered in the development of a new surface transportation program.

Mandates

--While certain federal requirements may be appropriate, others simply impose undue burdens on local governments and waste finite resources. There needs to be a differentiation made in imposing design standards at least on lower volume roads, as well as a review of those non-transportation goals which are included in federal surface transportation programs. Federal requirements attached to highway and transit funding should be reviewed and reduced.

Safety

--This concern needs to be factored into a future highway program. Clearly, deteriorating roads, deficient bridges, poor roadway design, and alcohol abuse create a safety problem on the nation's highway system. Another aspect of safety which should be addressed is to what extent the federal government will require local governments to allow large vehicles access to all roads.

Research and Development/Training

--There is an appropriate role for the federal government in this area. The federal government needs to be involved in developing new technologies for both highways and mass transit systems. With no manufacturers of rail cars left in the U.S. and the emergence of new transit technology such as magnetic levitation and linear propulsion systems, it is incumbent on the federal government to take a leading role in research and development in this field. In addition, the federal government should take a leadership role in providing up to date information on new technologies, management approaches, etc. to local government. The T-2 program is a good prototype for such a program.

TRANSPORTATION STEERING COMMITTEE RESOLUTION ON THE FUTURE OF THE FEDERAL SURFACE TRANSPORTATION PROGRAM

WHEREAS, the federal surface transportation program will expire on September 30, 1991; and

WHEREAS, the Interstate highway system is scheduled to be completed in 1991 thereby freeing up a substantial amount of funds; and

WHEREAS, counties own and maintain 1.7 million miles of roads or 43 percent of the total roads in the United States and 208,000 bridges or 51 percent of the bridges in the United States; and

WHEREAS, counties own or contribute to the funding of 25 percent of the public transit systems; and

WHEREAS, the movement of people, goods and services in urban, suburban and rural areas is vital to the nation's economy and its international competitiveness; and

WHEREAS, traffic congestion in suburban and urban areas is reaching a crisis stage; and

WHEREAS, smooth flowing, well integrated highways and expanded public transit are the best methods for meeting clean air standards; and

WHEREAS, county government will be playing a greatly expanded role in transportation in suburban and urban areas over the next several decades; and

WHEREAS, the nation's system of rural roads and bridges, a key factor to the economic vitality of rural areas, is deteriorating at an accelerated rate due to their age, the increasing weights of trucks and farm equipment, and expanding use due to railroad abandonment:

THEREFORE, BE IT RESOLVED that the new Surface Transportation Act contain substantially increased funding for programs which provide assistance to county governments that build, own, operate, maintain, fund, or otherwise have responsibilities for highways, bridges and transit systems and a greater role in the decision making/planning function in regard to these funds;

BE IT FURTHER RESOLVED that the National Association of Counties endorses the following provisions for inclusion in the new legislation:

1. The highway program should be user fee based.
2. The federal subsidy for public transit should come from the transportation fuel tax.
3. The balance in the trust funds should be spent down quickly.
4. The federal-state-local relationship needs to be strengthened. Counties and cities should be considered as equal partners in the new surface transportation program. Many of the problems which need to be addressed in the future are local in nature. Therefore, a process must be established which ensures that county governments are consulted and treated as equal partners in the planning, funding allocation, and other decision making processes.
5. A program continued to provide federal funds to maintain and upgrade the Interstate and primary systems.
6. A suburban mobility program should be created, replacing the FAUS program, which would be directed at solving congestion and mobility problems in urban and high growth suburban areas. These funds should be passed through to areas in excess of 200,000 population and, at option of local officials, could be spent on mass transit.
7. A rural access program be created which would fund the secondary road system (FAS) at a substantially higher level.
8. The bridge program (HBRRP) retain its separate identity with greater funding and a higher percentage of funds dedicated to off-system bridges.
9. The mass transit program would retain its separate identity, with a dedicated source of revenue.
10. Funding for mass transit should be increased and more flexibility should be given to the recipients of transit funding as to whether funds are spent for operating or capital expenses
11. The funding baseline for all programs, except Interstate construction (which is eliminated) should be no less than currently authorized under the existing highway program.
12. The $3 billion presently going to the Interstate construction program should be reallocated with no less than 50% to the urban/suburban mobility, rural access, and bridge programs and the remainder to the Interstate 4R/primary program.
13. Any new funds for the highway program, whether from a trust fund spend down or new gasoline tax authority, must be allocated 1/3 to the Interstate 4R/primary and 2/3 to urban/suburban mobility, rural access, and bridge programs.

14. Federal mandates attached to highway and transit funding should be reviewed. Those which impose undue burdens on county government and waste finite resources should be eliminated.
15. Safety concerns need to be factored into a future surface transportation program.
16. The federal government should take a more aggressive role in research and development/training.

Statement on the Reauthorization of the Federal Highway Program

Committee on Public Works and Transportation

Subcommittee on Surface Transportation

April 24, 1990

Presented By:

Edward R. Book

Vice Chairman
The Travel and Tourism Government Affairs Council, and

President
Travel Industry Association

Mr. Chairman, Members of the Committee, thank you for this opportunity to present the views of the travel and tourism industry on the reauthorization of the Federal highway program.

My name is Edward R. Book and I am President of the Travel Industry Association of America (TIA), the national trade association which represents the whole of the nation's travel industry. I also serve as Vice Chairman of the Travel and Tourism Government Affairs Council, an affiliate of TIA, which is a permanent coalition of 33 national organizations from every segment of the travel and tourism industry, including accommodations, food service, air and surface transportation, recreation facilities, travel agents, tour operators, attractions, and state and local travel and tourism officials. It is on behalf of the Government Affairs Council that I appear before you today.

The deliberations of this Subcommittee and the decisions it reaches concerning the future of the Federal highway program will have a profound impact on the travel and tourism industry. This is virtually self-evident because of the obvious linkage between travel and tourism and our nation's transportation system. What may not be so self-evident are the economic dimensions of travel and tourism. Yet it is demonstrably one of the country's largest and most diverse and dynamic industries -- and one with great potential for future growth that will provide rich benefits to more and more Americans and their communities. I would like first to call to your attention some of the more salient facts and data that illustrate what travel and tourism means to the United States. (All economic data are from the U.S. Travel Data Center.)

The Travel and Tourism Industry

In brief, travel and tourism is our nation's third largest retail industry (after auto dealers and food stores), generating more than $350 billion in gross receipts in 1989. With approximately 5.8 million Americans directly employed in travel and tourism, it is our second largest employer (after only health care), with another 2.5 million employed indirectly in providing goods and services to the industry. Travel and tourism is also vital to America's international balance of trade. In 1989, the $43 billion our country earned from a record 38 million international visitors made travel and tourism our largest export, ranking it ahead of agricultural goods, chemicals, motor vehicles, and all other products and services.

Following are some additional key points about this industry:

- Travel and tourism accounts for 6.7% of the GNP and 13% of the services sector.

- Over the past decade, travel industry employment has grown 43%, more than twice the growth rate for all U.S. industries. The 2.9 million new jobs created by the industry since 1979 accounted for 15.4% of the national increase in employment.

- Travel and tourism is one of the principal sources of jobs for women, minorities and the disadvantaged. In 1987, it employed 4.6 million women (52.9% of total travel industry employment as compared to 44.8% women in the national work force), 970,000 blacks (11.2% compared to 10.1% nationally), and 765,000 Hispanic Americans (8.8% compared to 6.9% nationwide).

- In 37 of the 50 states, travel and tourism is either the first, second or third largest employer.

- Travel and tourism creates jobs even during recessions. Employment in this industry has risen every year since 1958 despite five recessions during that period.

- Approximately 98% of the travel and tourism industry is comprised of small businesses.

- The travel and tourism industry payroll of $73.5 billion in 1989 surpassed the combined payrolls of the nation"s steel and motor vehicle manufacturing industries.

- Travel and tourism generated $42.8 billion tax revenues in 1989. Approximately $23 billion was paid to the Federal government and $19.8 billion to state and local governments.

- A growing number of regions and communities throughout the nation are realizing and experiencing the significant contribution that travel and tourism can make to their economic development programs. As a comprehensive study recently sent to Congress by the U.S. Travel and Tourism Administration found, travel and tourism can play an especially important role in the economic revitalization of rural America.

The slogan of National Tourism Week aptly suggests the enormous contribution of this industry to our national economy: "Tourism Works for America."

Travel and Tourism and the Highways

The integral connection between the American road and the American traveler is shown by the fact that an estimated 80% of all vacation "person-trips" (one person on a trip to a destination 100 miles or more away from home) are by auto, bus or recreation vehicle. Americans took 831 million of these vacation person trips in 1988 (396 million vacation trips with an average of 2.1 persons on each trip).

As a consequence, Americans traveled more than 321 billion miles on U.S. highways on vacation trips in 1988, spending nearly $225 billion along the way. And vacation travel in 1988 rose more than twice as fast as overall travel away from home.

The open road is appealing not only to Americans. Approximately 50% of foreign visitors to the United States use a car at least part of the time during their visit.

The impact of additional visitors on a the average U.S. community can be dramatic. Just 100 additional visitors a day will generate directly:

- $1.3 million in retail and service industry sales
- $280,000 in wages and salaries
- 29 new travel industry jobs
- $95,000 in state and local tax revenue
- 2 or more retail or service establishments

The indirect economic impact will typically double these figures.

It can be seen that a safe and efficient highway system promotes the distribution of vacation travel spending all across the United States. Traveler spending on vacations can be expected to increase almost 50% faster than annual inflation rates as long as highway travel is relatively hassle-free and convenient. Recognition of the economic importance and potential of travel and tourism should be incorporated into the shaping of the Federal highway program as we move toward the 21st century.

A Troubled Outlook

Unfortunately, the trends of recent years have not been positive for our national highway system. Gridlock and congestion have become too common, too often discouraging those contemplating a

trip across the country or just a long weekend away from home. Our highways, as well as the other vital components of our overall transportation infrastructure, must regain the priority attention of the Federal government.

We realize that we are "preaching to the choir" on this point. This Subcommittee is well aware of this need and has long led the fight in Congress to build and maintain our national highway system to meet the highest standards. Its members from both sides of the aisle are to be applauded for their commitment and their vision. We hope that the following observations and recommendations are helpful as the Subcommittee proceeds with this vital reauthorization process.

Examples and illustrations of the problems facing us are readily available:

- Afternoon rush hour across San Francisco's Bay Bridge extends five hours, from 2 p.m. to 7 p.m.

- That same extended rush hour in Southern California means that the two and a half hours normally required for the 117 mile drive from Los Angeles to San Diego increases to four to five hours.

- The twenty mile corridor along U.S. Route 1 from Trenton, New Jersey, to New Brunswick will become so choked with cars in the next 15 years that it might take five and a half hours to drive it.

- Here in Washington, the Capital Beltway carries 160,000 vehicles daily, with an average of six serious accidents a day that invariably tie up traffic for hours.

The U.S. Department of Transportation estimates that highway travel delays just in urban areas now total more than two billion hours annually, costing untold billions of dollars in lost working hours and economic productivity.

Along with the tangible cost in dollars and delay, there is also an insidious effect on the public. The American Automobile Association has begun surveying public attitudes to see what effect perceptions of traffic congestion may have on vacation or pleasure travel plans. Last year, a startling 92% of those surveyed said traffic congestion in their local area is either worse or had not improved in the previous twelve months. In 1989, 9% decided not to take a vacation or pleasure trip because of traffic congestion, and 4% changed their destination because of congestion. In the long run, of course, such decisions will mean travel and tourism dollars not spent and jobs not created in hundreds of communities.

Recommendations from the Travel and Tourism Industry

To enable the travel and tourism industry to continue to serve as a powerful engine of economic development and jobs creation, and as an indispensable contributor to a positive international balance of trade, our national highway system must have the infrastructure capacity to handle the escalating volume of traffic, while striving to be as "user friendly" as possible for the traveler. It should also be recognized that roads can be more than simply strips of pavement connecting two locations as efficiently as possible; some roads can be attractions in and of themselves as they provide picturesque access to areas of great natural or cultural beauty for the 40% of Americans whose favorite avocation is pleasure driving.

The following recommendations are made with these objectives in mind.

(1) <u>The travel and tourism industry supports continuation and expansion of the existing Federal surface transportation program, including highways, bridges and public transit.</u>

Completion of the Interstate Highway System should be fully funded. Maintenance of the physical and operational standards of that system at the highest levels should continue to receive great priority. At the same time, Federal leadership and financial support should be directed towards enhancing the capacity and safety of the other roads and highways which are of national or interregional significance. Metropolitan area mobility should receive particular attention, with bypasses, outer beltways and improved public transit utilized. It should be possible to increase the level of Federal support for these initiatives without increasing Federal highway user taxes for at least the first several years by spending down the balance in the Highway Trust Fund, including the interest earnings of the Trust Fund.

(2) <u>There should be more timely and fuller expenditure of user tax revenues collected for the Highway Trust Fund.</u>

The Federal Highway Trust Fund receives each year approximately $15 billion in tax revenues and interest income. In recent years the Trust Fund has spent annually only about $13 billion on roads and another billion on transit. This year the Administration has proposed $12 billion to be spent on roads and another billion on transit. This practice of withholding funds has resulted in an overall surplus of approximately $18 billion, including both highway and transit accounts, which has served to help mask the size of the Federal budget deficit. As the nation is confronted with a decaying transportation infrastructure and growing congestion on our roads, it is surely time to use these funds fully for the purposes for which they have been collected.

(3) Federal gas tax revenue should continue to be dedicated exclusively to the highway program.

Nothing would be more damaging to the prospects for achieving the surface transportation improvements so badly needed by our nation than to undermine the integrity of this historically proven revenue source. Yet it is distressing to see a few national leaders continue to advocate a gas tax increase to reduce the Federal deficit, or improve the environment, or increase oil conservation or to advance some other worthy goal. The Public Works Committee and this Subcommittee are to be highly commended for realizing the threat such proposals pose, and for leading the opposition to them in Congress. You are absolutely right on this issue and we can only offer our continued help and support.

(4) The travel and tourism industry supports increased capital investment in measures to enhance highway safety.

As this Subcommittee knows, according to the Federal Highway Administration, 23% of the 575,000 bridges in the United States are structurally deficient and another 19% are functionally obsolete. We concur with the Highway Users Federation proposal of a state-managed bridge program which would use Federal-aid funds to ensure the safety of all highway bridges, including inspection, maintenance, rehabilitation or replacement if necessary.

Additional Federal attention and support should also be given to safer highway design, including elimination of roadside hazards, and improved signs, signals and markings.

(5) The travel and tourism industry supports increased Federal research, development and training efforts to enable maximum use of the best available technology to improve the efficiency of surface transportation.

Perhaps the most promising long term prospect for relieving urban congestion and improving safety is the development of a program for putting "smart cars on smart roads." Joint public-private collaboration has already started to use existing technology to bring this concept to reality. We commend Transportation Secretary Skinner for his initiative in this regard and we urge careful consideration of the recently launched pilot project in Florida, and the Pathfinder Project in California.

(6) The travel and tourism industry supports the development of a national scenic byways program, including its incorporation into the 1991 Highway Act.

Such famous routes as the Blue Ridge Parkway, the Great River Road, and California Highway 1 have long demonstrated their value in preserving and promoting historic corridors, producing significant economic gains for many small near-by communities and rural areas, and providing enriching and inspiring experiences

for millions of American drivers and their families. Scenic byways even benefit users of the interstates and other major highways by attracting millions of recreational and pleasure drivers from those already congested thoroughfares. They also play a role in attracting international visitors to our shores, as evidenced by the fact that these visitors are the fastest growing segment of the recreation vehicle rental market, and that their visits to our national parks have increased by more than 50% during the past five years.

The Federal Highway Administration is now conducting an extensive twelve month study of the scenic byways already in use around the country, including an assessment of their economic impact. This study will be completed this fall and should provide valuable data and recommendations for the consideration of the Subcommittee during this reauthorization process. Among the possible policies with regard to scenic byways which should receive serious consideration are the creation of a national scenic byways program, with the byways designated and maintained by the states, but eligible for appropriate Federal highway assistance. Scenic byways under the control of Federal agencies such as the Forest Service, the Bureau of Land Management and the National Park Service should be eligible for Federal highway funds for construction and maintenance purposes. An Office of Scenic Byways in the Federal Highway Administration could serve as an information clearinghouse and source of technical advice and assistance for state programs, help coordinate the scenic byways activities of other Federal agencies and assist in marketing and promoting the nation's scenic byways to the public.

(7) <u>The travel and tourism industry supports improved transportation information systems to facilitate convenient, efficient and safe travel.</u>

The information needs of the traveling public should be carefully integrated into highway system design. This will become increasingly important as more and more travelers are older or less likely to have English as their native language.

The interstate highway system has made great strides in providing standardized signage, but refinement and improvement should still be sought, particularly with regard to its usefulness to international visitors. Highway research and development programs should include public information needs on their agenda.

We also believe the Federal government should again provide support for the construction and maintenance of "information" or "welcome" centers along not only the interstates, but also on other key primary roads. Not only would this assist the weary and perhaps confused traveler, but it would also benefit nearby communities and tourist facilities and attractions.

A valuable public informational role is also performed by the private outdoor advertising industry, and although a dilemma may

sometimes be perceived between informational value and scenic quality, we believe current Federal law strikes an appropriate balance. As a result, we would oppose efforts to alter or amend current law in any manner that would restrict the access to, or use of privately owned outdoor advertising by the travel and tourism industry.

Summary

This Subcommittee has a most formidable task ahead of it. Few, if any, matters on the Congressional agenda will have a more significant impact on the economic vitality and the international competitiveness of our nation than the future of our surface transportation system. And few, if any, industries will be more directly affected by the outcome of this reauthorization process than travel and tourism.

The travel and tourism industry has proven its economic strength and its potential for future growth. As a major component of GNP, a generator of new jobs, an earner of foreign exchange and a key contributor to local economic development, travel and tourism has few peers. With an adequate transportation infrastructure, it will continue to play a leading role in our nation's economy.

Travel and tourism joins many other industries in urging a continuation and expansion of the existing Federal surface transportation system. We believe that the necessary additional expenditures will not require additional Federal taxes for at least the next two or three years, provided the surplus in the Highway Trust Fund is fully expended in a timely manner and the integrity of its user fee funding through the dedicated gas tax is maintained. We also support additional Federal commitments to increased capital investments for improved highway safety, as well as to increased research, development and training efforts. A modest Federal commitment to a national scenic byways program would provide rich benefits not only to millions of Americans who enjoy pleasure and recreational driving, but also to many near-by communities. And finally, we urge that the information needs of travelers and tourists be given high priority in the future highway program.

The travel and tourism industry stands ready to provide whatever support and assistance this Subcommittee may think appropriate in the months ahead.

Reynolds, Executive Director, North Carolina League of Municipalities • Basil A. Rossland, Councilor, Bosque Farms, New Mexico • Barton Stallwood, Town Administrator, Lincoln, Rhode Island • Nate Tatarowski, Mayor, Oxnard, California • Richard C. Townsend, Executive Director, League of Oregon Cities • Avery C. Upchurch, Mayor, Raleigh, North Carolina • Thomas J. Volgy, Mayor, Tucson, Arizona

Mr. Chairman and members of the Committee, the National League of Cities is pleased to have this opportunity to testify today on reauthorization of federal highway and transit programs. I am Verna Clayton, Mayor of Buffalo Grove, Illinois, a Chicago suburb and chair of NLC's Transportation and Communications Policy Committee. I am also President of the Illinois Municipal League. Joining me this morning is Jim Beall, Councilmember from San Jose and Vice-Chair of our Committee.

I am testifying today on behalf of the 16,000 cities and towns represented by the League and our State Municipal Leagues. We appreciate your leadership in holding these hearings and this Committee's continued understanding of and support for the challenges faced by local officials in providing the best possible services for our citizens at the lowest possible cost.

Our interstate highway system began as a national security issue -- a defense highway network to assure our ability to move men and material in the event of a military emergency. While always available to serve that mission, the construction and completion of that system has created an entirely different effect. It created the first real "United States" by linking all of our great and diverse countryside and helping launch an extraordinary era of mobility and economic growth. The national investment in making that happen has been repaid many times over.

Now we are looking at our national transportation needs while also witnessing historic changes in the world around us. We hope for peace and talk of a "peace dividend," but we must also recognize that the stakes in global economic competition areas high, if not higher, than ever. The security of our nation depends upon our ability to compete effectively in the world marketplace, and a continuing national investment in our transportation system is and must be an essential priority.

We must be able to move our people to and from their workplace, we must be able to move products quickly and safely to their destinations, and we must do these things in ways that are compatible with our national goals of environmental quality and energy efficiency. We cannot do those things without a commitment of national resources to help carry out national policy. And this new investment, like the one that launched our interstate system, will also be repaid many times over.

Local officials face the enormity of our nation's public works needs every day. Congested and often inadequate roads, potholes and crumbling bridges are daily stories in our cities, suburbs and rural areas. That is why we were so pleased when Illinois' own

Secretary Samuel Skinner took charge of this issue and proceeded to draw up a comprehensive plan for our nation's infrastructure. Our high hopes were dashed, however, by the final plan which recognized the tremendous needs of our nation's transportation systems without the federal leadership to devote resources to solving the problems highlighted by the Secretary's report.

The good news in the plan was the attention it focused on our growing transportation and infrastructure needs. However, we believe the plan is shortsighted in its vision of state and local governments shouldering the majority of the infrastructure burden. Giving local governments greater flexibility to spend money raised locally is not our vision of a unified federal approach to solving our nation's infrastructure needs. Further, we were distressed by the plan's proposed designation of a system of highways of national significance. From our perspective and the perspective of our citizens that face massive congestion delays on roads choked with local and interstate traffic, we are concerned with the impression that roads not on a so-called system of national significance are to be considered insignificant.

Most distressing to local officials was the Secretary's message that local governments have to begin carrying their share of the responsibility and do more to build our nation's transportation system. The facts show that local governments have been raising and investing local dollars in transportation programs while the federal governments has been declining its responsibilities. The federal share has reached its lowest level in 27 years, while the local share has risen from 41 percent to 53 percent. Between 1984 and 1987, the federal share dropped from 31 percent to 23 percent, the state share from 29 percent to 24 percent.

We were also disappointed at what was left out of the report: a federal commitment to draw down the large balances in the aviation and highway trust funds, addressing congestion problems that threaten the economic growth of our communities and the need for greater equities in our tax code which currently favors fringe benefits for parking rather than our clean air goal of encouraging great use of mass transit through tax breaks for employer provided mass transit passes. We were encouraged by this Committee's reaction to the plan and hope that we can work together to develop a more realistic approach to our nation's needs.

In order to just maintain the physical characteristics of the nation's public sector surface transportation infrastructure at today's service levels through the year 2000, AASHTO estimates nearly $95 billion is required. Highway needs, they predict, are

$80 billion while transit requires an estimated $15 billion to meet future needs. AASHTO further projects that an additional $1 billion per year in constant dollars in highways and transit through 2020 would be required to adequately link surface transportation with airports, ports and waterways, and rail terminals. Constructing these intermodal connections will be critical if this nation is to compete in today's competitive global economy.

In response to these mounting public service costs, local governments have diversified and expanded local revenue sources, raising nonproperty taxes, including user fees. We can only do so much. Local income and sales taxes to a certain extent have proven to be successful revenue raisers; however, many communities are constrained by State-imposed property taxing caps. Today, 32 States have caps on local taxing and 46 States cap bonding which is especially troubling for smaller municipalities with limited tax bases.

Meeting the Challenges

Our nation's economy depends on an efficient surface transportation system to effectively move people and goods. Trends point to a declining system that is paralyzed by increasing traffic congestion impacting both our mobility and the environment.

Business travelers and every day users of our nation's transportation system face the growing epidemic of urban gridlock. This slow-motion sickness is costing the U.S. billions of dollars in lost productivity and wasted fuel. DOT calculates that in 1985 vehicles on U.S. freeways racked up 722 million hours in delays, a number that is expected to rise to 3.9 billion hours by the year 2005 if no improvements are made.

The California Chamber of Commerce estimates that traffic delays cost 300,000 hours-a-day in lost time and $135-a-year per motorist in urban areas such as Los Angeles. Urban congestion is costing California $2 million a day in lost productivity. Yet traffic delays on state highways are expected to increase 174 percent by 1995.

Recent studies of urban freeways by the Federal Highway Administration has found that in the brief three years between 1984 and 1987, travel escalated by 22 percent, and the amount of delay by over 60 percent. During peak hours in 1987, about two-thirds of all travel on interstate highways in urban areas occurred under congested conditions.

While the frustration level of our citizens grows with clogged highways and roads, increased national awareness and demands are being placed on transportation as a means of reducing harmful effects to the environment.

Transportation policy must be an integral part of the solution to a healthy environment. Nearly one-third of carbon dioxide emissions come from transportation sources. Moving traffic efficiently and increased availability and use of mass transit and other forms of high-occupancy, shared ride services represent a major objective that should guide development of future surface transportation policy.

NLC's Surface Transportation Initiative

Within the context of these problems, trends, barriers, and opportunities, a new federal surface transportation program must be forged. The National League of Cities has developed an initiative for the surface transportation program that calls for the federal government to redirect national transportation priorities to the urban and suburban areas of the country. The initiative is based on the following objectives:

- maintaining a healthier national economy by improving mobility in urban and suburban areas;
- promoting an improved quality of life for our country's citizens by improving traffic congestion and safety, air and visual quality, and energy conservation;
- meeting the mobility needs of the transportation dependent, such as the disabled and elderly, by providing a based level of transportation services;
- having the flexibility to invest in technologies to develop cost effective solutions to our nation's transportation problems;
- maintaining the past federal investments in transportation.

Long term federal, state and local partnerships meeting the demands of improved mobility require a strong commitment from all levels of government on a long-term basis. The current relationship should be strengthened into a long-lasting partnership with a common set of goals and priorities. This new partnership should include the following program structure elements:

o simplify and consolidate selected categorical programs into three highway programs:

1) a 4R and bridge program

The major focus of this program is the maintenance of the existing system. In addition, the federal program should allow the use of funds for local arterials complementary to the Interstate system as a way of relieving congestion.

2) an urban and suburban component;

This program recognizes the need for coordination in metropolitan regions. Federal funds would continue to be allocated by formula - FAUS for highways and Section 9 for transit. In addition, a flexible component of this program would allow for additional funds to supplement the formula programs to better meet highway and transit needs. Funding for this flexible component should be allocated to the states with a mandatory pass through to cities or metropolitan planning organization with populations above 200,000.

3) a rural program

The focus of this program is to maintain and improve rural access.

Further, increased funding for highway and transit should come from immediately drawing down the unspent balances of the Highway Trust Funds and reallocation of the $3 billion annually appropriated to the interstate construction program following its completion. We very much appreciate the Committee's leadership in this area.

Simple and flexible policies are required to fashion solutions unique to the changing demographics of our nation. We need to better coordinate across modal lines, across jurisdictional boundaries, and across the traditional separation of public and private responsibilities to maximize the network now in place.

Local governments have recognized this unique opportunity to evaluate the tremendous successes of our federal surface transportation system and plan for the future. Towards that goal, the organizations representing local governments have met to form a consensus on the outlines of a new surface transportation program that would best serve the needs of our citizens. Local officials representing NLC, the U.S. Conference of Mayors,

National Association of Counties, National Association of Regional Councils and American Public Transit Association met earlier this month and agreed on an approach that incorporates the need for local decision-making, increased flexibility in funding an consolidation of federal highway programs to make them more efficient. We believe it represents a step forward toward enhancing our nation's transportation needs.

We would like to share the local joint perspective with you, as soon as we have put the final touches on it. And we look forward to forward to working with you in putting together a surface transportation plan for the next century. Thank you.

Statement of the American Traffic Safety Services Association to the Subcommittee on Surface Transportation

Hearing on Highway Safety Issues

Presented by: Charles K. Dawson
President, American Traffic Safety Services Association

Accompanied by: Caroline Carver
Director, Government Relations
American Traffic Safety Services Association

101st Congress
April 24, 1990

Mr. Chairman and members of the Subcommittee, I am Charles Dawson, national president of the American Traffic Safety Services Association (ATSSA).

ATSSA is a national trade association in its 20th year representing over 700 companies and individuals in the traffic control industry. Most of the traffic safety equipment and services used on our highways are provided by ATSSA members. Our membership also includes public officials at all levels of government who are concerned with traffic control and the safety of the motoring public.

I am also a businessman and former president of Traffic Safety Supply Company in Portland, Oregon. As a member of the Board of Directors and consultant to that company, I am vitally concerned with the issues of highway safety, and I appreciate the opportunity to speak to this subcommittee today on this important subject.

In two major national consensus efforts, the Secretary of Transportation's National Transportation Policy, and the 2020 effort sponsored by AASHTO and the Highway Users Federation, enhanced transportation safety was mentioned as one of the top national priorities. Both reports call for renewed federal leadership. Today, with your permission, I would like to make some specific recommendations in areas of:

I. **Improved safety for aging drivers;**

II. **Improved work zone safety;**

III. **Uniformity of standards for traffic control devices**

IV. **Comprehensive safety management;**

V. **Reducing fatalities on rural interstate highways where speed limits have been increased to 65 mph; and**

VI. **Funding and the federal role.**

I. Improved Safety for Aging Drivers

We would like to commend the committee for mandating an older driver study as part of the 1987 Surface Transportation Act. Along with that study you authorized the states to carry out pilot programs of highway safety improvements to enhance the safety and mobility of older drivers. We have not seen an evaluation of these programs, but we are particularly interested in their effectiveness, and we look forward to reviewing the results.

We know intuitively that highway safety improvements reduce fatalities, but we don't often have figures that show so persuasively that well-spent dollars in safety improvements can dramatically save lives. In May of 1989, the New York State Thruway Authority announced that a safety program designed for older drivers would be undertaken on the entire the New York State Thruway--a cross-state superhighway. The Thruway Authority intended to become a leader in the country in meeting the needs of older drivers.

Here is what New York did: they increased pavement markings from four to six inches; they painted the markings twice a year; and they intend to upgrade over 15,000 signs and over 20,000 roadside delineators with brighter, state-of-the-art materials. In some cases they used larger lettering on signing with new, higher intensity sheeting. The Thruway Authority expected the visual impact of these improvements to be dramatic and the increased reflectivity to result directly in a safer road, not only for older drivers but for the general driving population as well. The figures indicate that is exactly what happened. In 1989 the fatality rate was .78 per 100,000,000 miles traveled -- 2/3 less than the national average of 2.2.

ATSSA recognizes the existing and growing problem of the aging driver. Currently, 12% of the U.S. population is 65 or over, and in the next 30 years, this number will more than double. It is clear that the present highway system was designed for an average driver that is far removed in age and ability from today's driver. With this in mind, ATSSA supports the findings of the National Academy of Sciences, reported through the Transportation Research Board in Special Report #218.

Specifically, we recommend:

A. Upgraded marking and signing standards and better maintained pavement markings and signs.

B. Improved positive guidance through the work zones.

A. Upgraded Marking and Signing Standards and Better Maintained Pavement Markings and Signs

In order to upgrade marking and signing standards to levels sufficient for older drivers:

(1) All roadways should be marked with center and edge lines and maintained at performance levels sufficient to meet the needs of the older driver.

(2) Sign legibility should be improved by requiring larger and brighter signs. (Current design standards are 50 ft. per one inch of letter height; the recommended standard from the National Research Council is 40 ft. per one inch of letter height.)

(3) Sign luminance and contrast standards should be increased where needed.

(4) Minimum required visibility distances should be increased through improved sign placement, multiple signing, and symbol messages where needed. ATSSA recommends:

To ensure that signs and marking standards accommodate the older driver, Congress should direct the Secretary to propose rulemaking that would establish revised and improved visibility and legibility standards for signs and markings to accommodate all drivers including the elderly and those with diminished visual capabilities.

B. Improved Positive Guidance Through the Work Zone

For the aging driver the added distractions of a work zone can impair the decision-making ability affecting perception and reaction time. Because aging drivers have more difficulty seeing, responding to, and interpreting changes in roadside conditions, all traffic control devices should be uniform in appearance, brightness, and placement so they will have consistent meaning from one worksite to another. Our specific recommendations regarding improving work zone safety are covered below.

II. Improved Work Zone Safety

Last year when we addressed this committee, we reported that work zone fatalities had shown a 40% increase from 1982-1985. This year we are saddened to report an 8% increase in work zone fatalities in 1988 -- 756 deaths and an estimated 28,000 disabling injuries in one year alone. These disturbing figures explain why one of our primary objectives is to improve the level of safety in construction work zones. This continued rise in fatalities shows how badly we need a work zone safety program in the 1991 Highway Act.

ATSSA endorses the recommendations of the Center for Auto Safety which call for a highway work zone safety program. This program would provide for improved work zone safety by enhancing the quality and effectiveness of traffic control devices, safety appurtenances, traffic control plans, and bidding practices for traffic control devices and services.

In order to address this critical issue of safety in work zones, ATSSA recommends that the new Highway Act include provisions for the following:

(1) Education and training of persons responsible for work zone traffic control are of utmost importance for the members of our association. In 1977, ATSSA initiated a certified Worksite Traffic Supervisor (WTS) Program. Developed as a joint effort with the Institute of Transportation Engineers (ITE) and the Federal Highway Administration (FHWA), the WTS program sets industry standards that have resulted in an upgrading of the quality of work zone traffic control. Eight states now require some degree of certification of worksite traffic supervisors, but all states should require this. Legislation should require that:

Each state highway department designate, and require the contractor to designate, for each project, a person trained and certified who will have the responsibility and authority of assuring that the provisions of the Traffic Control Plan (TCP) and other safety aspects of the work zone are effectively administered.

Legislative history should assert that these standards be formulated and adopted with due regard to the current training and certification program of ATSSA and should be equivalent or superior to this program.

(2) It has been shown that the use of individual bid items for traffic control devices provides a fairer method of paying for the devices, encourages the contractor to provide better maintenance of devices, and provides a better means of enforcing the provisions of the TCP. FHWA has recommended the use of individual bid items for a number of years, and yet many states still use lump-sum bidding or a combination of unit price and lump sum for traffic control in work zones. This practice often underfunds adequate traffic control and the contractor has an incentive to reduce to a minimum his cost for temporary traffic control. Legislation should require that:

Each state highway department use individual bid items for providing, installing, moving, replacing, and maintaining traffic control devices and safety systems.

(3) Many states do not collect work zone accident data, or if they do, it is collected inconsistently. We know how many fatalities occur in work zones, but beyond that, we know very little. There is no requirement for collecting work zone accident data. In fact, in December the FHWA eliminated the state and division narrative reports and requested that the states stop sending work zone accident data to FHWA headquarters, so it appears they will discontinue collecting work zone accident data altogether.

Each state highway department should be required to collect uniform data on all work zone accidents. Such data should include the type, design, and operational characteristics of work zones in which accidents have occurred; the type of roadway; traffic volume; the nature of the accident; and the extent of the damage, injuries, or fatalities sustained. Each state highway department should also analyze and use this information to correct deficiencies and to improve future traffic control plans.

(4) FHWA should perform effective oversight of work zone safety practices in the states and report on the progress of the states to Congress.

The Secretary should be directed to conduct annual reviews of work zone safety practices and policies, both state-by-state and on a national level in order to determine the effectiveness of each state's work zone safety practices. The results of such inspections, reviews, and assessments shall be annually reported to Congress.

(2) It has been shown that the use of individual bid items for traffic control devices provides a fairer method of paying for the devices, encourages the contractor to provide better maintenance of devices, and provides a better means of enforcing the provisions of the TCP. FHWA has recommended the use of individual bid items for a number of years, and yet many states still use lump-sum bidding or a combination of unit price and lump sum for traffic control in work zones. This practice often underfunds adequate traffic control and the contractor has an incentive to reduce to a minimum his cost for temporary traffic control. Legislation should require that:

Each state highway department use individual bid items for providing, installing, moving, replacing, and maintaining traffic control devices and safety systems.

(3) Many states do not collect work zone accident data, or if they do, it is collected inconsistently. We know how many fatalities occur in work zones, but beyond that, we know very little. There is no requirement for collecting work zone accident data. In fact, in December the FHWA eliminated the state and division narrative reports and requested that the states stop sending work zone accident data to FHWA headquarters, so it appears they will discontinue collecting work zone accident data altogether.

Each state highway department should be required to collect uniform data on all work zone accidents. Such data should include the type, design, and operational characteristics of work zones in which accidents have occurred; the type of roadway; traffic volume; the nature of the accident; and the extent of the damage, injuries, or fatalities sustained. Each state highway department should also analyze and use this information to correct deficiencies and to improve future traffic control plans.

(4) FHWA should perform effective oversight of work zone safety practices in the states and report on the progress of the states to Congress.

The Secretary should be directed to conduct annual reviews of work zone safety practices and policies, both state-by-state and on a national level in order to determine the effectiveness of each state's work zone safety practices. The results of such inspections, reviews, and assessments shall be annually reported to Congress.

(5) In order to encourage states to utilize superior traffic control devices and procedures and reduce serious losses now occuring in work zones, 100% federal funds should be made available for work zone traffic control.

23 U.S.C. Section 120(d) should be amended by adding between "... traffic signs" and "highway lights..." the phrase "or for temporary traffic control devices, markings, and safety appurtenances for guiding, warning, and protecting traffic, workers, and pedestrians in highway work zones."

III. Uniformity of Traffic Control Standards

Consistent, uniform standards for traffic control devices should apply to all classifications of roadways regardless of jurisdiction or user agency. Unfortunately, this is not the case. The Manual on Uniform Traffic Control Devices (MUTCD) for streets and highways presents a national standard governing the design and use of all traffic control devices. However, it is not uniformly enforced, particularly off the federal-aid highway system. Indeed, since the Secretary of Transportation is not legislatively required to promulgate the standards, there is a question as to whether the Department of Transportation even has the authority to enforce the provisions of the MUTCD.

To clarify this situation and provide for uniformity and strict enforcement of the provisions of the MUTCD, ATSSA recommends:

- ***The Secretary of Transportation be specifically required to promulgate standards and practices for the design and use of traffic control devices.***

- ***The location and design of all traffic control devices shall conform to nationally uniform standards and practices as promulgated by the Secretary and periodically revised to accommodate the state-of-the-art.***

It is not recommended that the MUTCD specifically be mandated but that the Secretary be required to create the appropriate uniform standards as a continuing federal responsibility, to amend them in a timely manner, and to ensure that they apply to all streets and highways. The MUTCD would likely continue to be the vehicle through which the FHWA would generate, amend, and enforce such standards, but the Secretary would be authorized to produce and enforce other traffic control standards outside the MUTCD.

IV. Comprehensive Safety Management

Unfortunately, state and local jurisdictions do not have adequate funding to upgrade signs or pavement markings, even though the Federal Highway Administration's Report on Highway Safety shows that in these areas alone we receive the maximum benefits in terms of lives saved and injuries prevented for every safety dollar spent. The annual Report on Highway Safety Improvement Programs, from the Office of Highway Safety, FHWA, states that the number one improvement which has most effectively reduced fatal and injury accidents at the lowest costs are traffic signs at a benefit/cost ratio of 20.9 to one.

We find categorical safety programs, while helpful in calling attention to vital safety problems and challenging state and local governments to provide for lifesaving safety improvements, have fallen short because they are underfunded and underrated. Oftentimes, these programs are not coordinated with the regular construction programs. Safety work should by done as part of 3R work, not as an afterthought or, worse, overlooked altogether. Because safety has been categorized into narrow and low-funded programs, it is often the last thing to be considered.

If safety is truly a top priority item, then it must be funded accordingly. ATSSA recommends the federal government provide leadership in the way of increased funding and specific legislative guidelines on how that money must be spent.

The next Highway Act should mandate that the states engage in safety construction work as part of their project requirements in performing 3R work.

Each state should be required to have a highway safety management program, approved by the Secretary which would include the following requirements:

- Standardization of forms and adequate record keeping for investigation of accidents, injuries, and deaths on all federal-aid highways.
- Design and traffic control standards that ensure the highest feasible levels of operating safety.
- Provisions for work zone safety.
- A system for evaluating the safety cost-effectiveness of projects completed with funding under this section, including work zone accidents.
- Other principles and requirements for areas of management, design, and operation as the Secretary shall deem necessary.

V. Reducing Fatalities on Rural Interstates and Other Expressways Where Speed Limits Have Been Raised to 65 MPH

According to the latest federal data, there has been an estimated 31% increase in fatalities on rural freeways over a two-year period where speed limits were increased to 65 mph. This means that there were 600 more deaths on rural interstates that might be directly linked to higher speeds. These new speed limits have created additional ramifications in workzones where speed enforcement is a critical problem.

Enforcement of speed is a major concern in highway work zones. These work areas are inherently dangerous, even under the best of conditions. Increased speed on our highways will increase the risk not only for the motorist but also for the highway worker. The fatality rate on interstate highways for work zone personnel accounts for 30% of all work zone deaths. By comparison, other interstate fatalities accounted for less than 10% of all highway deaths.

It is imperative that we have diligent law enforcement and assistance in work zones. The state of Pennsylvania recently passed legislation that doubled the fines for speeding through work zones. The publicity surrounding this as well as increased enforcement and the threat of double fines seems to have helped somewhat.

It appears that there is little chance of reducing the 65 mph speed limit. If speeds remain unchanged, then reasonable countermeasures need to be implemented on highways that have raised their speed limits to 65 mph.

> ***ATSSA supports the Center for Auto Safety and its recommendations that each state raising its speed limit to 65 mph be required to improve the highway to the highest levels for design and traffic control, including larger and brighter signs, improved pavement markings, and the use of other state-of-the-art traffic control devices.***

VI. Funding and the Federal Role

More that 45,000 people are killed and 3 million injured in traffic accidents each year. If vehicle miles traveled doubles by the year 2020 as expected, fatalities could increase to 90,000. This is horrifying. Safety considerations must be an integral part of every aspect of the new federal highway program.

During the last several years, ATSSA has served as a member of the Advisory Committee on Highway Policy. We support the policy recommendations of this group that the federal government must provide increased funds from a permanent and reliable source that will correct existing deficiencies and meet future needs. We also support their second principle which is that the highest priority of the national surface transportation program must be to preserve the physical integrity, enhance safety, and increase the effectiveness of existing highways, roads, bridges, and public transportation systems.

In order to carry out this mandate, we feel that there must be an increase in the authorization levels of all highway safety programs.

Specifically, we request:

1. *A significant increase in the FHWA-administered portion of 402 funds. This investment would result in the reduction of lost lives, property damage, and liability costs each year.*

2. *Separate federal funding categories for the training of personnel in work zone traffic control.*

3. *Requirements that products and services that enhance safety and improve traffic operations be included criteria for all federal "3-R" and "4-R" programs.*

4. *The Federal Highway Trust Fund should be made permanent. Remove it from the unified budget, and release it from obligation limitations. All interest earned (more than $1 billion annually), should be released to the states and local governments, and the balance of the Trust Fund should be drawn down to a reasonable level of $2 to $3 billion.*

NSWMA

National Solid Wastes Management Association

PRESENTED BY ROBERT EISENBUD

Statement of

Allen Moore

President

National Solid Wastes Management Association

before the

U.S. House of Representatives

Committee on Public Works and Transportation

Subcommittee on Surface Transportation

Washington, DC

April 24, 1990

38-253 O—91——56

Mr. Chairman, I am Allen Moore, President of the National Solid Wastes Management Association (NSWMA). NSWMA is a trade group representing over 2,500 private waste service companies in the U.S. and Canada. Included in our membership are refuse haulers, recyclers, landfill and resource recovery operators, hazardous and biomedical waste transportation, treatment, and disposal firms, manufacturers and distributors of waste equipment, and others. Private service companies now collect most of the country's residential and commercial refuse, operate about half its disposal capacity, and transport, treat and dispose of most of the nation's hazardous wastes. American manufacturers have long been considered the world leaders in technology for the efficient, safe, and environmentally responsible collection and transportation of wastes.

I am pleased to have this opportunity to testify before you today because of the unique opportunity that lies before you in the upcoming months as you consider legislation relating to the nation's highways. We are very hopeful that the Subcommittee will take advantage of this opportunity to correct an unworkable and largely unenforceable standard for many vocational trucking applications -- the federal bridge formula.

The bridge formula is set forth at section 127 of title 23, of the United States Code. Originally enacted in 1958, the section has been amended several times. The April 1987 amendments directed the Secretary of Transportation to make arrangements with the Transportation Research Board of the National Academy of Sciences for the conduct of a study of bridge formula related issues. The Secretary was specifically directed to include in the

study a "recommendation of appropriate treatment for specialized hauling vehicles [SHVs] which do not comply with the existing Federal bridge formula". A report on the results of that study is due soon. Unfortunately, it is expected to acknowledge the problems posed by the bridge formula but to refrain from any specific recommendations to resolve them.

NSWMA recommends that the Subcommittee craft legislation to remedy the serious problems posed for SHVs by the bridge formula. We suggest an amendment that would give states the flexibility to implement permit programs for SHVs, regardless of existing grandfather rights, on the Interstate Highway System and other federally funded roads. Having participated for more than 10 years in efforts of the National Truck Weight Advisory Council (NTWAC), we have become convinced that such a system would provide the necessary balance among elements relating to safety, environmental protection, wear and tear to the infrastructure, highway congestion, consumer benefit, and productivity. We support the proposal developed by NTWAC members in cooperation with the Federal Highway Administration for this purpose.

If such an SHV permit system were implemented uniformly for the private and public sectors, with no exceptions, it would create a level playing field where incentives to find "loophole" truck configurations that are detrimental to safety would be eliminated through stiff penalties and tough enforcement. Engineering skills and manufacturing capability could be better directed toward designs that provide the optimum in safety and minimum in highway impact. Permit fees could be set to offset the marginal increases in road wear that are legitimately attributable to SHVs. These funds could be used

for safety enforcement and upgrading of substandard infrastructure. A combination of performance-based criteria and a realistic fee structure could ensure that those who could exercise other design options would have an incentive to do so. The SHV program could be, in practice, reserved for those industry segments, and even operations within segments, whose operational requirements truly mandate the use of the short wheelbase heavy truck.

I would like to use the remaining time available to cite a particular example of an SHV, a highly job-driven design used in our industry with which many people are not at all familiar -- the commercial front-load truck. This vehicle type is used in the wee hours of the night and early morning to collect, compact, and transport refuse from restaurants, office buildings, and industrial facilities. This state-of-the-art machine requires just one operator to lift containers filled with up to several thousand pounds of solid wastes, remove and replace these bins in tight areas, maneuver around parked cars and trucks, and move into and out of loading dock areas up to 150 times on a shift. Maneuvering room is frequently limited to not much more than the length of the truck itself.

I have included a series of four photographs of a typical pickup situation for such a commercial front-loader. These should give you an idea of not only what the vehicles look like, but the challenges that drivers face many times a day. The photographs depict typical circumstances encountered on a route; they were taken on a real route, and they were not staged in any way. As you look at them, you might imagine that you are a driver and appreciate how impossible it would be to get in and out of this situation if the truck

were five or six feet longer. Please note as well that there is no place to put another axle that would not interfere with hydraulic lifting or body dumping equipment.

These trucks must carry with them the heavy-duty hydraulic equipment that enables them to do their job, and they must have a very short turning radius for maneuvering. They must also be able to maintain balanced chassis loadings through the range of incremental loading. These trucks must be capable of entering the primary highway system, mixing with general vehicle traffic, then performing in an off-road environment at the disposal site, frequently the unimproved roads of a landfill. The cargo body must withstand the pressures of up to 100,000 pounds in compaction force, and the chassis must be strong enough to endure the strains of lifting and off-road torsional forces.

The truck in this example has a Gross Vehicle Weight rating of 64,000 pounds, an empty weight of 34,000 pounds, and a payload of 30,000 pounds, all of this in full compliance with all federal motor vehicle safety regulations. Under the Federal Bridge Formula, it can operate at 49,000 pounds, or only 50 percent of its payload capacity (34,000 empty weight and 15,000 rather than 30,000 pound payload). Depending upon a state's grandfather rights, it can operate at weights anywhere in between these two figures under the hodgepodge of existing weight regulations on highways that were theoretically built to the same standards. This single truck impacts an HS-20 bridge at around 50 percent of its rated capacity, not even at the 55 percent inventory stress level that the structure is designed to withstand, day in and day out. In an

application where more than 50 percent of the mileage is run in an empty condition and a good portion of the remainder is run less than half full, doesn't it make sense to run one vehicle at its maximum capability, rather than running two trucks to cover the same route and doubling the transportation costs, doubling the likelihood of an accident, and doubling the air pollution?

In conclusion, Mr. Chairman, I urge the Subcommittee to take the lead in resolving the problems that the Federal Bridge Formula creates for SHVs. Safety, environmental quality, highway infrastructure, and essential services can all be served by doing so. I will submit a more detailed supporting statement for the record with your permission, Mr. Chairman, and I look forward to the opportunity to work with the Subcommittee on this important issue.

Comments By

Sherri George

Prepared for the

Subcommittee on Surface Transportation

United States House of Representatives

April 24, 1990

Good morning Mr. Chairman and...

As the Director of Marketing for Hoss's Steak and Sea House, I would like to thank you for providing me with the opportunity to address our views on the issue of billboard status with the Congress sub.-committee. This is the first time I've had the pleasure of speaking before such a distinguished group, and so I thank you for the privilege.

Hoss's Steak and Sea House is a rapidly growing chain of 25 restaurants in central and western Pennsylvania. Our family-style restaurants feature "back-to-basics" quality entrees at an affordable price.

Each location provides employment for more than 60 people. With the addition of employees from other divisions of Hoss's and corporate level employees, in total, the company employs over 2,000 people.

Hoss's has a $50,000,000 investment in the restaurant chain. The restaurant sites are not considered to be "prime locations". Real estate costs prohibit a company of our size to engage in negotiations or compete for the best selections of property. For this reason, we rely heavily on outdoor advertising as our primary medium and source of advertising.

Hoss's has a media budget of $900,000. Twenty-seven percent of that budget, $20,000 a month, is allocated to be spent on outdoor advertising.The importance of this number is that the budget is inclusive of our second largest expenditure. The 4-H/FFA Baby Beef Sales on which we spent over $125,000 last year. Its easy to calculate the allocated dollars for the other mediums.

The billboards act as an affordable medium and provide us with the opportunity to maintain market presence. But most importantly, they serve as a directional map for the public, which is vital for the survival of the restaurants in the competitive marketplace. Seventy-five percent of our 200 billboards are posted strictly as directionals. The local municipalities have varying standards that apply to the regulation of signage - many of them

prohibit a marquee large enough for the average driver to even notice. In a recent project, we acquired one of our limited "prime locations". The local ordinances were such that our store sign was not of a size to be effective - actually to even create public awareness that we were open for business. It was almost six months before a billboard, and it was still ll miles away, became available. The billboard solved our problem by communicating to the guest the fact that we were at a particular location and open for business. The restaurant of mention was projected to be one of our prime locations, but only became such after six months of waiting to obtain an initial directional billboard for the store. It took another three months to obtain an additional board.

In a few instances, the billboards have been a direct influence as to whether or not a restaurant is a profit center rather than dangling at the break-even point. We've seen as much as a 20% increase in customer count when the key billboard locations were made available to us.

With the Hoss's locations as they are, billboards are again, an affordable medium for our company. They provide us with the opportunity to enforce the continuity of our message and our business across the state. The cost, with respect to market value, for one month *is less than* the cost of a 30 second television air time. With most restaurant locations, there are 15-30 TV channels. There is no other cost efficient way to maintain the same value in market presence that outdoor advertising provides for our company with any other medium. Even now, we continue to evaluate each billboard, their location, and what locations could be more benficial. The question of directionals or marketing is still analyzed. Communication with the billboard companies is continuous.

I spoke about market presence, continuity, service, and the economic impact of outdoor advertising. I have not addressed the educational, safety or the other issues directly related to outdoor advertising..As an example I refer to the public service campaigns such as "Buckle up America". But in regards to those points, we're positive that others will address those subjects..... .....

Environmentally, billboards cause no harm. Aesthetically, they are

questioned, but should be accepted as a traditional form of information for the American public. There needs to be an evenly weighed scale on the balance between economics, information, and aesthetic interests.

Speaking for a company who derives growth based on success, profits, and customer satisfaction, none can be accomplished without the right combination of marketing. Perhaps the solution between economics and aesthetic values can be neutralized by energy spent on creative solutions and laws that would regulate maintenance and the overall quality of the existing outdoor medium industry. We even have a few... Again thank you for your time.

TESTIMONY

THE HONORABLE W. WILSON GOODE

MAYOR, CITY OF PHILADELPHIA

on behalf of

THE UNITED STATES CONFERENCE OF MAYORS

before the

SUBCOMMITTEE ON SURFACE TRANSPORTATION
HOUSE COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION

April 24, 1990

Mr. Chairman, Members of the Subcommittee, on behalf of the U.S. Conference of Mayors, I thank you for the opportunity to testify here today. As you know, the Conference represents the more than 800 mayors in this country serving cities with populations exceeding 30,000 residents. In broad and general terms, the constituency of the Conference is often referred to as urban America.

I am extremely pleased to share today's panel with my colleagues

from the National League of Cities. Between the two organizations, you have before you representatives of 16,000 cities and towns across this country.

Let me begin by telling you something we all know too well. Urban and suburban America are gridlocked by cars, trucks and other vehicles on our roads. That gridlock has had an enormous impact on the viability and longevity of our nation's highways, roads, streets, bridges, rail and mass transit infrastructure. The stories of crumbling infrastructure have become all too familiar. The question remains: how do we meet the national need for safe and efficient movement of people and goods? Mayors hope a large part of the answer to that question will come from this committee's reauthorization of surface transportation act.

Mayors seek your help in meeting the needs that we face on a daily basis at the local level. With the completion of the Interstate Highway System, a great opportunity is presented to reassess and redirect federal surface transportation policy. We believe this policy must be devoted to eliminating gridlock, relieving congestion and its adverse environmental consequences, enhancing public transportation, maintaining our national investment in roads, streets and bridges and making technological advances to enhance efficient and safe travel.

At our 57th annual meeting last June in Charleston, South Carolina, the Conference adopted a policy for the "Post

Interstate Era". A copy of our policy resolution is attached to my testimony.

The Conference of Mayors' national transportation policy addresses the goal of improving mobility in American society. Specifically, it addresses the following needs:

* Continued dedicated transportation funding and spending down the surplus in the Highway Trust Fund;

* Maintenance of the interstate and primary highway systems;

* Greater attention to the value of mass transit in congested areas and a level playing field in the tax treatment of employer-provided mass transit benefits versus the tax-free treatment of parking benefits;

* Enhanced flexibility in federal funding options;

* A separate and enhanced bridge program; and

* Greater emphasis on the consistency of environmental and transportation planning and goals.

Mr. Chairman, I believe that much of what the U.S. Conference of Mayors is seeking in a national transportation policy is comparable in large part to the goals announced earlier this year

by U.S. Secretary of Transportation, Samuel Skinner. We want to work with Secretary Skinner to fashion a national transportation policy which will meet the needs of America's cities today and into the future.

When I saw the national transportation policy, I asked the question every child asks himself when a new toy arrives at Christmas: Are the batteries included? Is there any juice in the new policy?

The Conference of Mayors has joined with state and local elected officials to form "Project 15". This project is seeking a $15 billion appropriation in Fiscal 1991 from the Highway Trust Fund. The $15 billion figure is a "pay as you go" expectation of what the Highway Trust Fund will take in during the year in gas tax revenue and accrued interest. Project 15 is devoted to putting the "trust" back into the Highway Trust Fund.

As Mayor of Philadelphia, I am proud to embrace the policy initiatives of the U.S. Conference of Mayors. They are high on my city's agenda. I would however like to take a moment to highlight some specific items of interest to my city.

There is one aspect of Secretary Skinner's policy that I heartily applaud - the use of federal transportation assistance to leverage greater participation by state governments in providing mass transit assistance. 70% of the 285,000 Center City

Philadelphia employees depend on public transportation to get to work. 38% of Philadelphia households do not even own an automobile. Philadelphia has the fourth largest public transportation system in the nation. Yet, there is no dedicated source of revenue authorized by the Commonwealth of Pennsylvania to support this transportation system which is vital to our city's economy and environment. This situation must change and if it takes federal leverage to change then so be it.

Mr. Chairman, reauthorization of the surface transportation act will follow close on the heals of a newly reauthorized Clean Air Act. There are elements of the Clean Air Act legislation making its way to passage in the House and Senate which are of vital importance to urban America. No longer can we afford to run environmental and transportation policy planning on separate tracks. Clean air and mobility are both vital to urban economic growth and stability. Environmental and transportation goals need not be incompatible; and therefore, planning to achieve those goals must be compatible and coordinated.

We cannot, Mr. Chairman, rely solely on auto emissions reductions to achieve clean air. Expected increases in the number of vehicles on our roads will inevitably erode the gains made through tighter emissions standards. Provisions contained in the Clean Air Act designed to reduce vehicle miles travelled - under review by the Public Works and Transportation Committee - are deserving of consideration and support.

Finally, Mr. Chairman, I applaud the efforts of this Committee to make full accessibility to public transportation a reality for all Americans by insuring access for the disabled. I would urge the Committee to insure that adequate resources are available to public transit providers so that they can meet this mandate while maintaining affordable service to the many Americans who rely on public transportation.

The reauthorization of federal surface transportation programs will be high on the agenda of the 58th annual meeting of the Conference of Mayors which will convene in Chicago June 15-20. We look forward to that meeting and to working with this Subcommittee as it creates a new policy for a new era in federal surface transportation assistance.

THE POST INTERSTATE ERA OF SURFACE TRANSPORTATION

OFFICIAL POLICY RESOLUTIONS

ADOPTED AT THE 57TH ANNUAL CONFERENCE OF MAYORS

CHARLESTON, SOUTH CAROLINA

JUNE 16 - 21, 1989

The United States Conference of Mayors
1620 Eye Street, NW
Washington, DC 20006
(202) 293 - 7330

THE POST INTERSTATE ERA OF SURFACE TRANSPORTATION

WHEREAS, the safe, efficient and environmentally sound transport of passengers and goods is of crucial importance to the future economic growth and development of urban America; and

WHEREAS, the completion of the Interstate Construction program in 1991 provides the nation with an excellent opportunity to examine the respective surface transportation responsibilities of federal, state and local government, as well as the private sector with respect to surface transportation; and

WHEREAS, The United States Conference of Mayors has long viewed the issue of surface transportation as one of mobility provided by roads, bridges, mass transit, bicycle paths and pedestrian ways,

NOW, THEREFORE, BE IT RESOLVED that the Congress and the Administration be guided in their deliberations over the structure of the post interstate era of the federally aided surface transportation system with generally the goal of enhancing mobilty for the national population, and specifically as follows:

Funding

- The revenues currently earmarked for the Gas Tax Trust Fund and any increases in such revenues, should continue to be solely allocated to surface transportation needs and not diverted for deficit reduction.

- Revenues generated by the gas tax should be expended at the level annually collected and the current surplus in the Gas Tax Trust Fund should be drawn down as expeditiously as possible.

- The Gas Tax Trust Fund should be removed from the Federal Unified Budget so that its user fee revenues are not used to disguise budget deficits on paper. Further, The United States Conference of Mayors opposes any turnback to the states of the federal gas tax.

- State and local governments must be permitted to implement innovative techniques to generate the local share for federally aided projects including administration costs, right-of-way donations or acquisitions, toll facilities or real estate impact fees.

- The fiscal impact of policies to promote alternative fuels on the federal gas tax trust fund should be revenue neutral.

Program Structure

Interstate and Primary Systems

- The Conference supports allocation of resources to state governments for implementation of responsibilities which are impractical to be performed by individual units of local government, such as maintenance of the interstate and primary systems. Current funding formulae, however, are improperly weighted against metropolitan areas. These formulae must be changed to recognize the vital needs on these systems that are found in urban America and amended accordingly. Formulae to states should not be based on lane miles but more importantly on passenger miles travelled, including transit passenger miles travelled. Also substate formulae should be crafted to match and foster programs designed to relieve congestion.

- Interstate and Principal Arterials must be maintained and funding for maintenance on these systems should be held harmless with respect to increased system development. The emphasis of increased lane mileage should be replaced with capacity management goals or increasing the number of passengers not vehicles travelled on all federally aided systems. Such increased management techniques include emphasis on car and van pools, HOV lanes, mass transit and flex time hours.

- Eligible products in the Interstate program for capacity expansion, the 4th R of the I4R, must include the examination of various options to assist the capacity on the Interstate, such as HOVs and transportation management systems. Interstate funding would be available for projects even if the alternative is not on the Interstate system so long as the proposed project would aid capacity movement on the Interstate system.

Interstate Transfer

- The Interstate transfer program was a program breakthrough in the federal system of surface transportation assistance in that it permitted localities to decide what mode of transportation, whether highway, mass transit or a combination thereof,

best addressed their congestion problems. The federal government must honor and fulfill its commitment made in prior years in this program and institutionalize this system of local option as more fully explained below.

Urban/Metropolitan System

- The lack of Federal emphasis and funding for urban America's roads and transit systems is inconsistent with the stated goal of a federal surface transportation program of alleviating congestion where found. It is the belief of The United States Conference of Mayors that improved mobility in urban America may only come about as a result of our maintaining our current infrastructure, enhancing capacity to increase passenger miles traveled and demand management techniques and permitting the application of flexible and innovative responses adapted to local needs. Such a program must include at a minimum:

  - dedication of interstate and primary funding in urbanized areas;

  - strengthening of the funding levels for the federal aid urban system and formulae mass transit grants and permitting the current fungibility of a certain portion of these funds;

  - creation of a strategic metropolitan grant program with additional new funding which may be used at the discretion of the metropolitan area to meet either transit, road or nonmechanized transportation needs;

  - the eligibility for projects under this additional program would be unrestricted for road projects and available for capital and operating mass transits projects.

Bridges

- The special nature of and vital role of bridges in the national surface transportation program warrants the existence of a separate category in federal aid system. All bridges, regardless of their characteristics as a roadway or railway bridge, must be made eligible for the off-system bridge program and preventive maintenance projects, must be included as eligible for funding.

Safety

- Safety must always be a top priority of a surface transportation program. Further, safety grants should be directed in substantial portion to urban areas as it is in urban areas that the greatest number of people would benefit from such grants.

Matching Funds

- The level of required state/local matching funds should not be the deciding factor in what project a state DOT chooses to proceed with. Therefore, The United States Conference of Mayors would support a level or consistent match grant ratio across all programs. An 85/15 match is not unacceptable.

Clean Air

- In all cases, federal transportation policy should be cognizant of the need to direct resources to clean air.

- The Federal Tax Code should be amended so as to equalize the transportation fringe benefits that an employer may provide an employee.

April 24, 1990

TESTIMONY FROM THE I-66 STEERING COMMITTEE
BEFORE THE HOUSE SUBCOMMITTEE ON SURFACE TRANSPORTATION

This testimony is being offered for the I-66 Steering Committee and its Chairman, Mayor Bob Knight, of Wichita, Kansas. This testimony is being offered by the staff of the Steering Committee to include one or all of the following:

Dr. Lonnie E. Haefner, Director of Governmental Affairs
Glen Dockery, Executive Director
Walter Wildman, Associate Director

Testimony by Walter Wildman, Associate Director

On behalf of the I-66 Steering Committee, I want to thank this Subcommittee and its Chairman for the opportunity to speak to you today.

It was a little over a year ago, on April 13, 1989, that an organizational meeting was held in St. Louis, Missouri. At which time, the I-66 Steering Committee was formed. The Highway and Transportation Committee, of the Cape Girardeau Regional Commerce and Growth Association, presented the concept of a coast-to-coast super highway to seventy enthusiastic city and state officials, congressional leaders and industrial managers. The plans for the proposed highway would require much work and dedication on the part of those who were captivated by the potential gain from such a project.

After consulting with Congressman Bill Emerson, of Missouri's 8th District, the Committee learned of the need for a feasibility study. After collecting an initial amount of funds, staff was appointed to carry out the required steps to obtain the feasibility study. The staff consists of a Director of Governmental Affairs, Dr. Lonnie Haefner, and Executive Director, Glen Dockery, of Wichita, Kansas, and an Associate Director, Walter Wildman, of Cape Girardeau, Missouri. This staff was charged with the responsibility, by the Steering Committee, of gathering support from cities, counties and states, as well as the Federal Government.

Dr. Haefner was given the specific task of developing a pre-application or working paper. This task was completed in December of 1989. That same month, a presentation was made to the Federal Highway Administration. The pre-application in subsequent months has been used as a centerpiece by the staff in presentation made to cities, states and congressional staff.

In March of 1990, the headquarters of the project was established in Wichita, Kansas, the largest city along the proposed route. Wichita Mayor, Bob Knight, was chosen as Chairman of the Steering Committee. The composition of the Committee reflected the diversity of the corridor, three State Senators, Helen Garrett of Kentucky, Rose Ann Vuich of California and Jim Rea of Illinois; as well as Representative Rex Smith of Kentucky. City officials were represented by three Mayors, Bob Knight of Wichita, George Rhodes of Cape Girardeau, Missouri and Carlton Meyer of Jackson, Missouri, and City Manager Bob Cumbley of Springfield, Missouri.

The process of collecting endorsements and funds from cities and states along the proposed corridor is an ongoing process. To this time, the staff has collected support from over twenty cities and counties. Financial obligations have been sought this spring and efforts will continue through the summer.

The Director of Governmental Affairs, Dr. Lonnie Haefner, will now give you a more detailed analysis of this project. It is with great pride that we all have worked on a project that has such a potential for greatness for our nation. I believe it was Robert Frost who said, and I paraphrase, "You have the courage to take the road less traveled, and that will make all the difference."

We appreciate the opportunity to offer testimony on the I-66 Corridor Project. The past two years have been a serious examination of the need for a new national statement of surface transportation policy. Several stimuli have spurred professional and trade association groups to undertake such a review and document their findings. The most relevant issues appear to be:

The doubling of surface travel demand by the year 2020.
Continued urban congestion and gridlock.
A fifty percent decrease in American productivity over the last decade, tied to lagging infrastructure investment.
Direct negative impacts of the above on our international trade processes.
The closing of Interstate Authorization in 1992.
Related needs to identify new highway corridors which serve post-interstate demographic and economic growth patterns and serve rural America's accessibility needs.
The need for increased highway funding to accomodate the above travel demand growth, improve our domestic productivity and effectiveness in international trade.

In light of the above, this testimonial document is a proposal to request funding for a feasibility study of a 2,400 mile corridor stretching east to west across America. Termed the I-66 Corridor, it will yield significant national increase in accessibility, tourism, economic impact and intermodal avenues for international trade. The rationale for the presence of the corridor is the fact that only two major east-west flows exist to process travel across the U.S. - that of Highway 40 and Highway 70. Separated by up to 350 miles, the result is a lack of direct travel capabilities through America's heartland, linking major rural producing areas with major urban and rural centers.

Further, as the interstate authorizations draw to a close in 1992, it is appropriate to yield opportunity for a new review of America's corridor patterns. The post-interstate age must address several germane questions - How have population and activity centers shifted in the U.S. in the last decade of Interstate Construction? - What are the opportunities for growth in the future of the U.S.? - How can major highway corridors help such growth be achieved?

The transcontinental Interstate 66 Project, as conceived and presently proposed, would traverse the United States along an east-west alignment generally midway between I-40 to the south and I-70 to the north. The initial proposed 50 mile wide corridor would cross all or parts of the following states:

1. California
2. Nevada
3. Arizona/Utah
5. Kansas/Oklahoma
6. Missouri
7. Illinois/Kentucky
8. West Virginia/Ohio
9. Virginia/Maryland

The approximately 2,400 mile long route is expected to originate in the vicinity of existing I-5, which is located east of the California Coastal Ranges and in the Fresno-Bakersfield Valley, and thence run eastward through the Sierra Nevada Mountains, generally across the states noted above, with an eastern terminus in Washington, D.C., termed the northern option, or Norfolk, Virginia, termed the southern option.

The western two-thirds of the corridor is located across areas that are not adequately served by the present Interstate highway system and which need improved transportation facilities to make a significant area of the nation's recreational and scenic resources available to the population and to encourage economic development.

The western one-third of the corridor will ultimately require extremely careful analysis for final route identification because of environmental considerations. The middle one-third of the corridor appears to present few issues, except possible local issues. The eastern one-third of the corridor may present areas with expanded state/local issues as it passes through areas with historic significance or generates environmental concerns.

Preliminary cost analysis has been performed, resulting in an initial cost range of 17-17.5 billion dollars for the route. This will be further refined with the use of detailed cost modelling by the engineering team over the next few months. As noted in a previous paragraph, significant environmental issues may arise during future detailed studies.

The engineering cross-section associated with the alignment is that of high-type, Interstate design standards which include a 200-350 foot right-of-way, and local service frontage roads. The design speed is conceived at 70 mph, with grades and curves within acceptable Interstate standards. Originally conceived as two 12 foot lanes in each direction, it may be developed as three lanes in each direction, with one lane dedicated as exclusive truck lane. Subgrade, subbase, pavements and related geometrics would be of design and depth to accomodate heavy weight trucks sanctioned in the 1982 Surface Transportation Assistance Act (STAA). The economic benefits of such operation have been thoroughly documented in Transportation Research Board Special Report 223.

In addition, in keeping with the potential for increased performance from our highways, the above cross-section may be increased to 350-400 feet, and three lanes @ 14 feet per lane, with an exclusive truck lane, and design speeds in the 80-100 mile mph range. This is possible, though costly, to yield an "autobahn" performance level on our nation's highways. No cost figures have been run on this at the moment, but they will be significantly higher that those above. Much will depend on design standards foreseen by FHWA for post-interstate systems conceived to have major impacts on national economic development.

As stated earlier, a doubling of national travel demand is expected by year 2020. The presence of I-66 will reduce traffic on I-40 and I-70 by approximately one-third, and yield a longer life of useful traffic flow for those facilities. In addition, as the truck percentages in each system are expected to be in the 20-35% range, the removal of truck traffic from the stream can be expected to reduce accident rates on facilities by about 20%. This is a significant reduction. Interviews with truckers have indicated that the presence of the I-66 corridor will yield a route travel time reduction of up to 400 miles, essentially one-half day of travel, or an equivalent of up to 2-3 days/month. This is truly significant, yielding increased productivity of the trucking system, shorter shipper delivery times and resultant fuel savings of $40-$80/run, resulting in an annual savings per truck-tractor unit of $7,000/year.

In addition, this route allows a direct linkage of west-east deep water ports to midwest railroads, and travel from the west coast to the gulf coast and east coast ports within 1½ to 3 days from the west coast. Thus, containerized cargo and perishables can be moved intermodally by rail-water-truck or truck-rail or water-truck in a national "land bridge system" which connects the major internal and export-import break-bulk points of the nation with world markets. This movement is significantly faster than by any one mode in isolation, or deep water traverse through the Panama Canal. Such related moves have become a conventional opportunity, as Asian freight is brought to U.S. west coast ports, trucked to the midwest or east, then airlifted, barged and/or deep-sea exported from the U.S. to Europe. This represents very significant opportunities for the U.S. to become a major intermodal cargo clearinghouse for world trade movements, in addition to enhancing its own export-import flow patterns. The presence of the I-66 corridor would greatly improve tonnage across the ports of San Francisco, Oakland and Long Beach, California and enhance the above clearinghouse effect in the midwest and at east coast and gulf ports.

There is a major set of population, although not metropolitan, which represents a series of significant population centers in rural America which can be linked together both economically and physically along the proposed I-66 route. Total 1986 population of the northern route option, terminating in Washington, D.C., based on Bureau of the Census reports, was approximately 12.4 million. Total 1986 population of the southern route option, terminating in Norfolk, Virginia, was approximately 10.3 million. For the northern route option, total 1986 income was estimated at $148.0 billion with an estimated average household income of $33,228. For the southern route option, total 1986 income is estimated at $99.0 billion with an estimated average household income of $27,274.

Finally, simple model analysis of the impact on the corridor of the proposed I-66 facility is underway through the development of multipliers. The economic impact of highway investment is the change in economic activity resulting from highway expenditures. Impact occurs because of shifts in economic activity among regions and because of increases in total economic activity in all regions. Specifically, the multipliers exhibit the amount of dollars generated per dollar of revenue in the basic industry. A multiplier takes into account the fact that various segments of the economy are interdependent and that not all dollars spent have ultimately the same impact on growth and change in the economy. Multipliers are being developed for business activity, household income, travel expenditures, and government revenues. It is planned that future work will also include employment, property value losses and gains, and export multipliers.

Use of the above of multipliers indicate the impacts that can be experienced during and after construction of the proposed I-66 facility on counties within a 50-mile corridor. Based on preliminary analysis, the northern route option of proposed I-66 is anticipated to experience an economic impact in excess of 303.7 billion and a construction impact of 62.7 billion. The southern route option would experience an economic impact in excess of 281.5 billion and a construction impact of 64.5 billion. This is truly a significant gain, and illustrates the benefit of adequate highway corridors to GNP.

It is likely the requested feasibility study can be performed over a 12-month period, with a total cost estimated at 2 million dollars. Each particular state department of transportation in the corridor will be requested to supply a matching $50,000 - $75,000 towards the feasibility study effort. The amount of federal funds requested is $1,500,000. Design effort subsequent to the above will take some continual five years, with complete construction of the facility taking another fifteen years. The above timetable is ambitious, but reflects the urgency of provision of an infrastructure facility which has major positive national accessibility and economic impacts.

TESTIMONY TO THE UNITED STATES HOUSE OF REPRESENTATIVES

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
Surface Transportation Subcommittee

TRAFFIC SAFETY
AND
SPEED LIMIT COMPLIANCE REQUIREMENTS
April 24, 1990

Presented by
M. J. Hannigan, Commissioner
California Highway Patrol

TESTIMONY TO THE UNITED STATES HOUSE OF REPRESENTATIVES

COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
SURFACE TRANSPORTATION SUBCOMMITTEE

APRIL 24, 1990

GOOD MORNING, MR. CHAIRMAN AND COMMITTEE MEMBERS. I AM MAURICE J. HANNIGAN, COMMISSIONER OF THE CALIFORNIA HIGHWAY PATROL, AND I AM HERE REPRESENTING THE STATE OF CALIFORNIA. MY TESTIMONY WILL FOCUS ON THE IMPORTANCE OF TRAFFIC SAFETY; PRINCIPLES TO CONSIDER DURING THE REAUTHORIZATION OF TRAFFIC SAFETY PROGRAMS; AND FINALLY, SOME SPECIFIC COMMENTS ABOUT THE LONG-STANDING ISSUE OF SPEED LIMIT COMPLIANCE REQUIREMENTS. WE APPRECIATE THE OPPORTUNITY TO SPEAK BEFORE YOUR DISTINGUISHED COMMITTEE.

IMPORTANCE OF SAFETY

FIRST, AND MOST IMPORTANT, TRAFFIC SAFETY IS A CRITICAL LOCAL, STATE AND NATIONAL PROBLEM. YOU'VE HEARD FATALITY COUNTS AND INJURY ESTIMATES FROM THE U.S. DEPARTMENT OF TRANSPORTATION, AND STATISTICAL FORECASTS OF ACCIDENT TRENDS IN THE RECENT GENERAL ACCOUNTING OFFICE REPORT THAT YOU COMMISSIONED. MY AGENCY AND I HAVE TO DEAL WITH THE REALITY OF THOSE STATISTICS, NOT JUST NUMBERS AND TABLES AND CHARTS, BUT LIFE AND DEATH ON OUR HIGHWAYS.

THIS IS A SAD MONTH. SAD BECAUSE IT IS LIABLE TO BE A TYPICAL APRIL, A SPRING MONTH WHERE NEARLY FOUR THOUSAND AMERICANS WILL DIE ON OUR NATION'S HIGHWAYS. THE REALITY OF THIS STRIKES EVEN CLOSER TO HOME THAN USUAL BECAUSE TWO OF THESE FATALITIES WERE FAMILY MEMBERS OF CHP EMPLOYEES -- EJECTED FROM THEIR VEHICLE DURING A TRAFFIC ACCIDENT. NO SEATBELTS -- JUST TWO SEPARATE, SENSELESS ROUTINE TRAGEDIES ON OUR HIGHWAYS. THESE TWO TRAGEDIES TOUCHED US PERSONALLY, BUT THINK OF ALL THE OTHER FAMILIES AND FRIENDS WHOSE LIVES ARE IN DISARRAY AFTER A LOVED ONE HAS DIED IN A TRAFFIC ACCIDENT.

THIS UNDERLIES MY PERSONAL COMMITMENT TO PUBLIC SAFETY AND SERVICE, AND UNDERSCORES THE NEED TO USE LIMITED RESOURCES IN THE MOST EFFECTIVE MANNER POSSIBLE.

AS SAD AND FRUSTRATING AS THIS ASPECT OF LAW ENFORCEMENT CAN BE, THERE IS REASON FOR ENCOURAGEMENT. AS YOU KNOW, THE NATIONAL MILEAGE DEATH RATE HAS BEEN GRADUALLY IMPROVING. IN CALIFORNIA, PRELIMINARY ESTIMATES SHOW A 13 PERCENT REDUCTION IN FATALITIES (160 LIVES) THIS YEAR. THIS IMPROVEMENT IN HIGHWAY SAFETY IS DUE TO A WIDE RANGE OF PROGRAMS IN HIGHWAY ENGINEERING, ENFORCEMENT, AND PUBLIC EDUCATION. IT'S ALSO DUE TO CHANGES IN LEGISLATION, REGULATION, AND JUDICIAL PROCEDURES. THE POINT IS, THAT MANY FACTORS CONTRIBUTE TO SAFETY IMPROVEMENTS, AND A GOOD TRAFFIC SAFETY PROGRAM MUST REFLECT A BALANCED APPROACH.

IN CALIFORNIA, OUR MILEAGE DEATH RATE IS LOWER THAN IT EVER HAS BEEN AND I THINK THE STATE'S COMPREHENSIVE APPROACH TO SAFETY WILL CAUSE THIS TREND TO CONTINUE. WE HAVE IMPLEMENTED ONE OF THE TOUGHEST DUI LAWS IN THE COUNTRY WITH A .08 PER SE BLOOD ALCOHOL LIMIT. WE STARTED A SOBRIETY CHECKPOINT PROGRAM SEVERAL YEARS AGO AND JUST RECENTLY PURCHASED PRELIMINARY ALCOHOL SCREENING DEVICES TO INCREASE OUR EFFECTIVENESS IN REMOVING THE DRINKING DRIVER FROM THE HIGHWAY.

IN JULY, A SECOND VALUABLE TOOL WILL BE ADDED WHEN WE START ADMINISTRATIVELY SUSPENDING THE LICENSES OF DRIVERS UNDER THE INFLUENCE. DRIVING UNDER THE INFLUENCE OF ALCOHOL OR DRUGS IS THE BIGGEST SAFETY PROBLEM FACING MOST IF NOT ALL STATES AND IT IS DESERVING OF CONSIDERABLE EMPHASIS.

SEATBELT USAGE IS ANOTHER IMPORTANT CONTRIBUTOR TO SAFETY. NOT ONLY DO WE HAVE A STRONG CHP SEATBELT ENFORCEMENT PROGRAM, BUT MY DEPARTMENT PLAYS A MAJOR ROLE WORKING WITH LOCAL LAW ENFORCEMENT TO INCREASE THEIR EMPHASIS ON SEATBELT VIOLATIONS THROUGHOUT THE STATE.

38-253 O—91——57

IN LATE 1988, I ESTABLISHED THE CALIFORNIA SAFETY BELT TASK FORCE. THE PURPOSE OF THE TASK FORCE IS TO COORDINATE THE EFFORTS OF FEDERAL, STATE, AND LOCAL AGENCIES; NEWS MEDIA; SAFETY ORGANIZATIONS; AND OTHERS INTERESTED IN INCREASING THE USE OF OCCUPANT RESTRAINT SYSTEMS BY THE MOTORING PUBLIC. OUR GOAL WAS TO REACH A 70 PERCENT SAFETY BELT USE LEVEL BY THE END OF 1990.

I AM HAPPY TO REPORT THAT INITIAL SURVEYS INDICATE THAT WE HAVE ACHIEVED OUR GOAL. THE COMPLIANCE RATE IN CALIFORNIA HAS RISEN FROM AN ESTIMATED 25 PERCENT IN 1985, THE YEAR BEFORE OUR LAW BECAME EFFECTIVE, TO 70.3 PERCENT CURRENTLY. THIS SUBSTANTIALLY EXCEEDS THE 1989 NATIONAL RATE OF 46 PERCENT. ENFORCEMENT AND PUBLIC EDUCATION BOTH CONTRIBUTED TO THIS SUCCESS.

AS A PART OF OUR EDUCATIONAL EFFORTS, THE TASK FORCE CONTACTED ALL CALIFORNIA SCHOOLS (K THROUGH 12TH GRADE). MATERIALS WERE PROVIDED TO CARRY OUT SAFETY BELT EDUCATION ACTIVITIES DURING THE UPCOMING "BUCKLE-UP AMERICA" WEEK, MAY 21-28.

IN 1989, MY DEPARTMENT ISSUED 716,000 CITATIONS FOR SAFETY BELT VIOLATIONS. THIS WAS THE SECOND MOST COMMON CHP CITATION; SECOND ONLY TO SPEED.

SPEED ENFORCEMENT IS AN IMPORTANT AREA OF EMPHASIS FOR MY DEPARTMENT.

WITH ALL DUE RESPECT, MR. CHAIRMAN, WHEN I HAVE TESTIFIED BEFORE THIS COMMITTEE IN THE PAST, SOMETIMES THERE HAS BEEN AN UNDERCURRENT OF CONCERN REGARDING CALIFORNIA'S COMMITMENT TO ENFORCING SPEED LAWS.

I HOPE YOU WON'T BE SURPRISED TO HEAR THAT I THINK SPEED ENFORCEMENT IS VERY IMPORTANT. WE ISSUE MORE 55 MPH CITATIONS THAN ANY STATE IN THE NATION; OUR CITATIONS PER MILE OF ROADWAY ARE BETTER THAN THE NATIONAL AVERAGE; WE'VE BEEN CHARACTERIZED AS HAVING HIGH PENALTIES FOR SPEED VIOLATIONS; AND 85 PERCENT OF MY OFFICERS' TIME IS SPENT PATROLLING HIGHWAYS WITH MAXIMUM SPEED LIMITS.

SPEED ENFORCEMENT IS IMPORTANT. ABOUT ONE-THIRD OF ALL THE CITATIONS WE WRITE ARE FOR SPEED VIOLATIONS. AND WE CITE MORE SPEEDING VIOLATORS THAN ANY OTHER TYPE.

HOWEVER, I CANNOT LOOK AT THIS PROBLEM WITH BLINDERS. MY RESOURCES, LIKE YOURS, ARE LIMITED. I MUST SEARCH FOR THE MOST EFFECTIVE USE OF THOSE FUNDS. MY RESPONSIBILITY TO THE CITIZENS OF CALIFORNIA DICTATES THAT I ACHIEVE THE MAXIMUM IMPACT BY SETTING PRIORITIES. AND ALTHOUGH SPEED ENFORCEMENT IS IMPORTANT, IT IS NOT OUR ONLY PRIORITY. IT IS PART OF OUR BALANCED AND COMPREHENSIVE APPROACH TO TRAFFIC SAFETY.

A NEW DIMENSION TO THE SAFETY CHALLENGE RESULTS FROM THE GENERALLY INCREASING USE OF ILLEGAL DRUGS. WE HAVE BEEN VERY AGGRESSIVE IN MEETING THIS CHALLENGE. ABOUT 950 CHP OFFICERS HAVE COMPLETED SPECIAL TRAINING TO BECOME DRUG RECOGNITION EVALUATORS (DRE). THE TRAINING ENABLES THEM TO BETTER IDENTIFY MOTORISTS WHO ARE UNDER THE INFLUENCE OF DRUGS. BECAUSE OF THIS EXTENSIVE TRAINING PROGRAM, THE CHP EMPLOYS HALF OF ALL THE DRE'S IN THE NATION.

THERE ARE A NUMBER OF OTHER CHP PROGRAMS THAT CONTRIBUTE TO OUR IMPROVING MILEAGE DEATH RATE. THESE INCLUDE COMMERCIAL VEHICLE INSPECTION AND ENFORCEMENT, DRUG INTERDICTION, AND ETHNICALLY-BASED COMMUNITY EDUCATION PROGRAMS, TO NAME A FEW.

IN ADDITION, THERE IS A WHOLE RANGE OF PROGRAMS WITH SAFETY BENEFITS THAT ARE CARRIED OUT BY THE CALIFORNIA DEPARTMENT OF TRANSPORTATION. IN PARTICULAR, I WOULD LIKE TO POINT OUT THE TOP PRIORITY THEY HAVE GIVEN TO THE INSTALLATION OF CRASH CUSHIONS, MEDIAN BARRIERS, GUARDRAILS AND BREAK-AWAY SIGN POLES. ENGINEERING STRATEGIES ARE OF PARTICULAR IMPORTANCE IN REDUCING THE SEVERITY OF ACCIDENTS.

AS YOU CAN SURELY APPRECIATE, THERE ARE MANY ENFORCEMENT, ENGINEERING, AND EDUCATION STRATEGIES THAT ARE PART OF MEETING THE CHALLENGE OF TRAFFIC SAFETY. BASED ON OUR EXPERIENCE WITH THE MANY FACETS OF THIS PROBLEM, I WOULD LIKE TO RECOMMEND SOME GUIDING PRINCIPLES FOR THE DEVELOPMENT OF THE HIGHWAY REAUTHORIZATION BILL.

SUGGESTED REAUTHORIZATION PRINCIPLES - SAFETY

1. FEDERAL/STATE/LOCAL/PRIVATE PARTNERSHIPS -

   SECRETARY SAMUEL SKINNER CONVENED A TRAFFIC SAFETY SUMMIT EARLIER THIS MONTH TO DISCUSS A NUMBER OF IMPORTANT SAFETY TOPICS. IN TALKING WITH THE SECRETARY, HE MADE IT CLEAR PART OF THE PURPOSE FOR THE SUMMIT WAS TO LAY A FOUNDATION FOR A PARTNERSHIP BETWEEN STATES AND THE FEDERAL GOVERNMENT.

I COMMEND THIS ATTITUDE. CONCERTED, COORDINATED SAFETY EFFORTS ARE FAR MORE LIKELY TO BE EFFECTIVE THAN ADVERSARIAL OR DISJOINTED ACTIVITIES. FEDERAL, STATE, AND LOCAL GOVERNMENT, ALONG WITH THE PRIVATE SECTOR -- ALL HAVE AREAS OF EXPERTISE AND CAN PROVIDE LEADERSHIP TO ADDRESS THE MANY AND VARIED TRAFFIC SAFETY PROBLEMS THROUGH COOPERATIVE PROGRAMS.

2. COMPREHENSIVE AND FLEXIBLE PROGRAMS -

MANY TRAFFIC SAFETY PROBLEMS, SUCH AS DUI, ARE NATIONAL IN SCOPE, BUT THERE IS A DIVERSE RANGE OF SPECIFIC LOCAL NEEDS AND CONDITIONS. TO BE EFFECTIVE, FEDERAL SAFETY PROGRAMS SHOULD BE FLEXIBLE ENOUGH TO RESPOND TO DIFFERING LOCAL CONDITIONS AS WELL AS TO TAKE ADVANTAGE OF OPPORTUNITIES AFFORDED BY STRONG LOCAL SAFETY LAWS AND PROGRAMS.

THE MULTI-DIMENSIONAL NATURE OF SAFETY PROBLEMS IS ANOTHER IMPORTANT REASON FOR PROGRAM FLEXIBILITY. TO IMPROVE A STATE'S MILEAGE DEATH RATE, COMPREHENSIVE PROGRAMS ARE NEEDED THAT PERMIT A STATE TO CUSTOMIZE THE APPROPRIATE MIX OF DUI, SPEED, SEAT BELT, COMMERCIAL AND OTHER TYPES OF ENFORCEMENT AND EDUCATION. WE DO NOT THINK COMPLIANCE REQUIREMENTS AND THE DISTRIBUTION OF FEDERAL RESOURCES SHOULD BE EXCESSIVELY FOCUSED ON ANY ONE PROGRAM AREA, SUCH AS SPEED.

3. OVERALL FUNDING LEVEL -

WITH REGARD TO NEEDED RESOURCES, WE AGREE WITH OTHER HIGHWAY SAFETY ADVOCATES THAT ADDITIONAL FUNDS WILL BE REQUIRED TO MAINTAIN THE DOWNWARD TREND IN THE MILEAGE DEATH RATE. THE STATE OF CALIFORNIA HOPES TO MEET SOME OF OUR NEEDS WITH A SPECIAL TRANSPORTATION FUNDING INITIATIVE. WE HOPE THAT THE FEDERAL GOVERNMENT CAN AFFORD TO INCREASE ITS COMMITMENT AS WELL.

4. INCENTIVES VS. SANCTIONS -

55 NMSL SANCTIONS ARE A POTENTIAL FISCAL HARDSHIP FOR AN INCREASING NUMBER OF STATES. UNFORTUNATELY, THIS TYPE OF STATE/FEDERAL ADVERSARIAL RELATIONSHIP SEEMS TO BE INCREASING.

IF SOME KIND OF DIRECT FEDERAL OVERSIGHT IS REQUIRED, WE BELIEVE INCENTIVES ARE MORE EFFECTIVE IN BOTH THE SHORT AND LONG RUN. IN THE LONG RUN, GREATER FEDERAL/STATE COOPERATION IS ENCOURAGED. IN THE SHORT RUN, INCENTIVES AVOID THE COUNTERPRODUCTIVE LOSS OF NEEDED SAFETY FUNDS.

THIS IS THE PERVERSE SITUATION FACING CALIFORNIA WHERE IN THE NAME OF SAFETY, AS MUCH AS $28 MILLION IN NEEDED FEDERAL HIGHWAY FUNDS COULD BE SANCTIONED. LOSS OF FEDERAL REVENUE WILL HURT CALIFORNIA'S TRAFFIC SAFETY PROGRAMS.

5. "REAL" SAFETY IMPROVEMENTS -

THE COUNTERPRODUCTIVE NATURE OF SANCTIONS ALSO ILLUSTRATES OUR FINAL PRINCIPLE. WE BELIEVE THAT SAFETY PROPOSALS SHOULD BE JUDGED BY THE EXTENT TO WHICH THEY ACTUALLY REDUCE ACCIDENTS AND INJURIES. HYPOTHETICAL OR "HOPED-FOR" PROGRAM RESULTS DO NOT REDUCE SOCIETY'S PAIN AND SUFFERING. WE'RE INTERESTED IN DUI, SEATBELT, SPEED, AND OTHER PROGRAMS THAT ACTUALLY SAVE LIVES AND REDUCE INJURIES AND PREVENT PROPERTY DAMAGE. IN OTHER WORDS, WE WANT PRACTICAL, FLEXIBLE PROGRAMS THAT REALLY WORK; PROGRAMS THAT RECOGNIZE THE LIMITATIONS AND OPPORTUNITIES OF THE REAL WORLD.

NATIONAL MAXIMUM SPEED LIMIT
COMPLIANCE REQUIREMENTS

AS YOU KNOW, THERE IS A STATUTORY REQUIREMENT FOR MONITORING THE PERCENT OF TRAFFIC EXCEEDING 55 MPH, AND CONSEQUENT FISCAL SANCTIONS FOR NONCOMPLIANCE.

WE DO NOT BELIEVE THIS MONITORING AND SANCTION PROCESS PRODUCES REAL SAFETY BENEFITS.

IN LIGHT OF CRITIQUES BY THE TRANSPORTATION RESEARCH BOARD, THE GENERAL ACCOUNTING OFFICE, AND OTHERS, THERE IS WIDESPREAD AGREEMENT THAT THESE STATUTES SHOULD BE CHANGED. AND FROM THE VIEWPOINT OF MANY STATES, THERE IS WIDESPREAD AGREEMENT ON HOW TO CHANGE.

TO NAME A FEW, THE NATIONAL GOVERNORS ASSOCIATION (NGA), MY COLLEAGUE FROM THE NATIONAL ASSOCIATION OF GOVERNORS HIGHWAY SAFETY REPRESENTATIVES (NAGHSR), THE AMERICAN ASSOCIATION OF STATE HIGHWAY AND TRANSPORTATION OFFICIALS (AASHTO), AND THE INTERNATIONAL ASSOCIATION OF CHIEFS OF POLICE (IACP) ARE ALL ON RECORD OPPOSING THE USE OF A SANCTION PROCESS FOR SPEED LIMIT COMPLIANCE.

THE IACP HAS GONE ONE STEP FURTHER AND AS COLONEL TIPPET ABLY DESCRIBED AT YOUR MARCH 22ND HEARING, IACP ADVOCATES THE REPEAL OF THE "FEDERAL REQUIREMENTS RELATING TO MONITORING AND SANCTION PROVISIONS OF THE NATIONAL MAXIMUM SPEED LIMITS."

WE AGREE WITH THE IACP POSITION. CALIFORNIA ALSO HAS A PRACTICAL PROBLEM THAT I MENTIONED EARLIER. BECAUSE WE'RE IN VIOLATION OF THE SPEED LIMIT REQUIREMENT THAT MANY BELIEVE SHOULD BE CHANGED, AS MUCH AS $28 MILLION OF OUR FEDERAL HIGHWAY FUNDS ARE IN JEOPARDY. UNLESS THERE IS CONGRESSIONAL ACTION, WE WILL LOSE THOSE APPORTIONMENTS ON OCTOBER 1ST OF THIS YEAR.

IF THERE IS NO AGREEMENT BY OCTOBER ON A SUBSTANTIVE REVISION TO THE COMPLIANCE REQUIREMENT, WE RESPECTFULLY REQUEST THAT A MORATORIUM BE IMPOSED TO SUSPEND SANCTIONS FOR FISCAL YEAR 1989 AND 1990 SPEEDS. THIS WOULD ALLOW THE COMPLIANCE REQUIREMENT TO BE RESOLVED WITHIN THE CONTEXT OF THE REAUTHORIZATION BILL.

CONCLUSION

IN SUMMARY, I THINK THERE IS WIDE AGREEMENT THAT TRAFFIC SAFETY IS AN IMPORTANT ISSUE NOW, AND IT WILL BE AN EVEN MORE IMPORTANT ISSUE WITH THE PROJECTED INCREASES IN DRIVERS, VEHICLES AND TRAVEL. CALIFORNIA ALSO BELIEVES THAT THE FEDERAL GOVERNMENT SHOULD HAVE A SIGNIFICANT ROLE IN TRAFFIC SAFETY IN THE POST-INTERSTATE ERA.

WE BELIEVE THIS FEDERAL ROLE SHOULD BE BASED ON THE IDEAS OF EQUAL PARTNERSHIP, MUTUAL COOPERATION, COMPREHENSIVE AND FLEXIBLE FEDERAL PROGRAMS, ADEQUATE FUNDING, RELIANCE ON INCENTIVES, AND A STRONG FOCUS ON PROGRAMS WITH PRACTICAL SAFETY BENEFITS THAT ARE TAILORED TO THE SPECIFIC NEEDS OF THE STATES. UNTIL SUCH A PROGRAM IS IN PLACE, WE DO NEED YOUR ASSISTANCE IN PREVENTING A LOSS OF FUNDS FROM SANCTIONS.

CALIFORNIA CURRENTLY HAS A COMPREHENSIVE HIGHWAY SAFETY PROGRAM, AND WITH THE SUPPORT OF MANY FEDERAL PROGRAMS, HAS ACHIEVED A MILEAGE DEATH RATE UNDER 2.1 IN 1989. ALTHOUGH THIS IS BETTER THAN THE NATIONAL AVERAGE, WE ARE NOT SATISFIED AND WILL CONTINUE TO DEVELOP DUI, SEATBELT, SPEED, COMMERCIAL VEHICLE AND OTHER PROGRAMS TO SAVE MORE LIVES AND REDUCE THIS MILEAGE DEATH RATE EVEN FURTHER.

I COMMEND YOU FOR YOUR INTEREST IN TRAFFIC SAFETY. THANK YOU FOR THE OPPORTUNITY TO SPEAK, AND I WILL BE HAPPY TO RESPOND TO ANY QUESTIONS THAT YOU MAY HAVE.

43.A4306.A7720.7301L
REV. 4/20/90

TESTIMONY OF PHILIP W. HASELTINE
EXECUTIVE DIRECTOR
AMERICAN COALITION FOR TRAFFIC SAFETY, INC.
BEFORE THE SURFACE TRANSPORTATION SUBCOMMITTEE
COMMITTEE ON PUBLIC WORKS AND TRANSPORTATION
U.S. HOUSE OF REPRESENTATIVES
APRIL 24, 1990

Mr. Chairman and members of the subcommittee, I am Phil Haseltine, executive director of the American Coalition for Traffic Safety (ACTS). I appreciate very much the opportunity to testify at this important hearing on the future of safety programs which are components of the highway reauthorization legislation. ACTS is a nonprofit safety organization which devotes most of its resources to educating the American driving public about motor vehicle occupant protection. Because of ACTS' role in highway safety, we are most interested in ensuring that many of the NHTSA programs included in this reauthorization be continued or expanded.

The nation realized great progress in highway safety during the 1980's. A substantial portion of the credit for that progress goes to this committee and the leadership you have so often demonstrated. During the 1980's the highway fatality rate fell from 3.3 deaths per 100 million vehicle miles traveled to a record low of 2.2 last year. The 45,500 people killed in traffic crashes during 1989 marked the fifth time during the decade that fatalities declined over the previous year.

This story of achievement is far different from the gloomy predictions at the start of the decade. NHTSA was then predicting 70,000 highway deaths a year by 1990 and a fatality rate of 3.55. As the data, which can been seen on the graph attached to my statement show, the results were far different from the predictions.

Why were the pundits so wrong? Because they failed to comprehend that working together; government, industry, traffic safety groups, the medical community and concerned citizens could make significant progress in a relatively short period of time. Here's what happened:

- Prior to 1980, only one state had a child safety seat law. By 1985, all 50 states had such laws.

- Prior to 1984, no state had enacted a safety-belt-use law. Today 34 states and the District of Columbia have belt-use laws and belt use has increased from 13 percent to 46 percent. More than 15,500 lives have been saved as a result of increased safety-belt use during the decade, 10,500 of which are directly attributable to belt-use laws.

- Prior to 1980, thirteen states had 21 year minimum drinking age laws. By 1988, all 50 states had such laws.

- Drunk driving was largely ignored in 1980. Comedians made jokes about drunk driving on prime time television and NHTSA's position was that not much could be done about the problem. Organizations like Mothers Against Drunk Driving (MADD) recruited millions of volunteers and drunk driving is no longer socially accepted behavior in this country. Alcohol-related fatalities have declined as a result.

- State and community highway safety programs (the 402 program) were revitalized. At the end of the Carter and beginning of the Reagan administrations, funds authorized by this committee were not expended due to obligation limitations. Later in the decade, this important funding stabilized, permitting the continuation of the state-federal partnership you envisioned with the enactment of the Highway Safety Act of 1966. You wisely provided incentives for states with good safety belt, child safety and drunk driving programs. And, you legislated penalties for states not having 21 a year old minimum drinking age and those not enforcing the National Maximum Speed Limit.

But, despite the progress during the 1980's, we need to do more. This nation should establish a national objective of fewer than 40,000 annual traffic fatalities by the year 2000. Notwithstanding the predictions of the naysayers a decade ago and the suggestion in the current administration's National Transportation Policy that we may see 60,000 highway deaths a year by the turn of the century, an objective of 40,000 annual fatalities is both realistic and obtainable. It will, however, require the utmost in planning, coordination and utilization of available resources to reduce fatalities in the face of increased travel. If a national objective of fewer than 40,000 annual highway fatalities is to be achieved, the following elements must be present:

- Sixteen states still do not have safety-belt-use laws and many existing laws would be more effective if they were strengthened to provide for primary enforcement and stiffer penalties. Effective belt-use laws in all states along with expanded safety belt education will be necessary if the goal of seventy percent belt use by 1992 is to be achieved. **Congress should consider incentive legislation to encourage states to enact belt-use laws, to strengthen existing laws and to promote compliance with child safety seat laws.**

- The failure to wear motorcycle helmets results in approximately 1,000 needless fatalities each year along with $300 million annually in medical expenses, lost productivity and other injury-related expenses. **Congress should seriously consider enacting legislation along the lines of that proposed by Representative Cooper to provide states with incentives to enact motorcycle helmet laws.**

- Motor vehicles are becoming safer. Many of the improvements are incremental in nature, small engineering changes that result from a better understanding of crash dynamics, innovation and improved technology. Rear seat lap-shoulder belts are now standard on all passenger cars and many light trucks and vans. They will soon be standard on all these vehicles as well. Other vehicle safety features, such as anti-lock brakes and the extension of certain passenger car safety standards to light trucks and vans are going to save additional lives.

  A year ago fewer than a million cars were equipped with supplemental air bags. This model year, close to three million cars will be sold with air bags and that number will triple over the next three or four years. Our challenge is to ensure that the motoring public understands the continuing need to wear safety belts in air bag-equipped vehicles. If motorists use air bags and safety belts in combination, thousands of additional lives will be saved.

- Despite the progress in reducing drunk driving, thousands of Americans still die because of drivers who are under the influence of alcohol or other drugs. **Congress should continue programs to provide incentives to states having comprehensive DWI and drugged driving programs.**

- **Congress should provide modest funding increases for the 402 program and should provide additional resources for NHTSA's occupant protection and alcohol countermeasures programs.**

- Evidence is accumulating that fatalities are increasing substantially in some states which have raised maximum speeds on rural Interstates. **Congress should consider enacting legislation which would provide incentives for increased speed enforcement, particularly on roads posted at 65 mph. One concept developed by this committee during the debate over the National Maximum Speed Limit would have permitted states to raise speeds on selected roads if other stringent traffic safety countermeasures (such as specified safety-belt-use levels) were in place. The time may be right to re-examine that proposal or something similar to it.**

Mr. Chairman, we have a real opportunity to expand on the progress of the last decade and further reduce the number of Americans who die or are seriously injured on our highways each year. With your continued leadership and the help that will be forthcoming from the traffic safety community, motor vehicle manufacturers, federal, state and local government, and from concerned citizens, we can reduce traffic fatalities to 40,000 - or lower- by the beginning of the next century. Thank you for the opportunity to appear before you today.

PRESERVING THE INTERSTATE SYSTEM

Statement of
John W. Hill, Jr.
Associate Director, Transportation Issues
Resources, Community, and Economic
Development Division

Before the Subcommittee on Surface
Transportation
Committee on Public Works and
Transportation
United States House of Representatives

GAO/T-RCED-90-68

GAO Form 100 (13/87)

Mr. Chairman and Members of the Subcommittee:

I appreciate the opportunity to be here today to testify on our on-going work on federal and state efforts to preserve the Interstate Highway System. Although the Interstate system represents only 1 percent of all roads, Interstate routes carry 21 percent of the nations's vehicle traffic. Because the system has assumed a dominant and vital role in the nation's transportation network, preservation of the over $100 billion federal investment in Interstate construction must be ensured.

As requested by the committee, we reviewed the Interstate Resurfacing, Restoration, Rehabilitation, and Reconstruction (4R) program and the adequacy of Interstate maintenance efforts to slow pavement deterioration. In summary, we found the following:

-- In 1988, the Department of Transportation (DOT) classified 57 percent of the nation's Interstate pavement in good condition. The remaining 43 percent is classified as fair or poor which means that the ride on a significant percentage of the nation's premier highway system may be barely tolerable or worse.

-- Progress in adequately maintaining the Interstate system, a state-financed responsibility, has been mixed, in part because some states have not adequately funded Interstate

maintenance. In two of three states we visited, needed maintenance was not performed, since the resources devoted to maintenance were insufficient. Although Federal Highway Administration (FHWA) engineers identified maintenance problems, they did not always follow up to ensure that the state corrected maintenance deficiencies, even when some were safety-related.

-- In 1981, the scope of the Interstate 4R program was significantly broadened to allow funding for reconstruction, including lane widening. Although major lane widening was not initially expected to be a major component of the 4R program, states have increasingly used 4R funds to widen the Interstate in response to worsening congestion. If this trend continues, the 4R program will change from primarily a pavement preservation program to one that includes a large widening element. DOT estimates $4.7 billion to $6.1 billion will be needed annually in federal and state funds, of which about 50 percent will be used for Interstate widening. The other half would go primarily to preserve existing Interstate pavement.

Given the overall condition of the Interstate and increased funding needs, we are presenting some options that the Congress may wish to consider for re-aligning federal responsibilities and

funding the program to better ensure that the nation's investment in the Interstate System is adequately protected.

EVOLUTION OF THE 4R PROGRAM

Responding to a need to preserve the Interstate system, the Federal-Aid Highway Act of 1976 established the Interstate Resurfacing, Restoration, and Rehabilitation (3R) program. This program provided federal funds to states for capital improvements that would generally extend the life of the pavement. The Federal-Aid Highway Act of 1981 added a fourth "R", reconstruction, as an eligible type of work. Reconstruction includes, but is not limited to, the addition of travel lanes (widening), and the construction and reconstruction of interchanges and overcrossings along existing Interstate routes. In addition, other types of projects became eligible in 1981, including repairing or replacing bridges and constructing bicycle, pedestrian, and equestrian trails, as well as fringe parking lots, sound barriers, and landscape plantings. All of these activities are eligible for 90 percent federal cost sharing. However, some projects have numerous beneficiaries, while others have a limited number of beneficiaries.

CONDITION OF THE INTERSTATE PAVEMENT

FHWA classifies pavement into three broad categories--good, fair, and poor--according to roughness.

-- Good pavement provides a smooth ride, with little or no signs of deterioration.

-- Fair pavement may provide a barely tolerable ride at high speeds and has a number of surface defects.

-- Poor pavement produces an uncomfortable ride which requires reduced driving speeds and has excessive bumps, depressions, or holes, and needs resurfacing and/or reconstruction.

The amount of good pavement has decreased (see attachment I) from 62 percent in 1981 to 57 percent in 1988, while the amount of fair pavement has increased from 25 to 31 percent. Poor pavement has remained at about 12 percent between 1981 and 1988. The bottom line is that the ride on 43 percent of the nation's premier highway system may be barely tolerable or worse. Moreover, the outlook for improvement beyond this level is not encouraging because DOT's estimate of future needs are based on recent pavement conditions. For example, the Department's estimate of future 4R needs through 2005 is based on maintaining 1985 conditions. In 1985, about 41 percent of the pavement was rated in fair or poor condition. DOT has not established goals to improve conditions beyond the 1985 level.

Although the percentage of poor pavement has stabilized nationally, the percentage of poor pavement varies among individual states. In 1988, the percentage of poor pavement ranged from less than 2 percent in 13 states to over 25 percent in ten states. This difference can be caused by a variety of factors including the adequacy of routine maintenance, age of the pavement, the amount of traffic and load carried, and environmental effects (temperature and rainfall). According to the American Association of State Highway and Transportation Officials (AASHTO), the separate or interacting effects of these components are not clearly defined at present.

Deteriorated pavement results in societal costs such as traffic delays, increased fuel costs, decreased productivity, and the potential for increased accidents, injuries, and vehicle damage. For example, a 1988 report[1] estimated that in Michigan, driving on substandard roads was costing drivers about $480 million or about 11 percent of their total driving costs.

MAINTENANCE OF THE INTERSTATE SYSTEM

Maintenance of the Interstate System is a state-financed responsibility. Some routine maintenance activities can slow deterioration. However, routine state maintenance can include many

---

[1] An Analysis Of Current And Future Deterioration on Michigan's State, County And City Roads, The Road Information Program, Aug. 1988.

different activities, such as repairing crash barriers, fixing potholes, resealing pavement cracks, removing snow and ice, and painting bridges.

Maintenance activities that preserve pavement life, such as resealing joints, are cost-effective. However, these types of maintenance activities are not eligible for 4R funds. Yet if they were applied in a timely manner they could reduce or postpone the need for 4R funds. For example, a 1985 DOT-Office of the Inspector General report concluded that had routine maintenance been performed when needed in three states, planned 4R project costs of $88.3 million may have been reduced or deferred.

FHWA developed its Interstate Maintenance Guidelines in 1977 because of congressional concerns that portions of the Interstate System were prematurely aging due to inadequate and untimely maintenance. In 1987, FHWA revised its maintenance guidance to respond to concerns over unresolved maintenance deficiencies, insufficient follow-up inspections by FHWA field engineers, and FHWA's not requiring the states to take corrective action.

We judgmentally selected three states--California, Louisiana, and Michigan--to review the adequacy of state maintenance efforts. Two of the three states we reviewed were experiencing problems in adequately funding needed maintenance activities. FHWA frequently identified safety hazards as a common maintenance problem. At

least twenty-five percent of all deficiencies, including safety hazards, had not been resolved as called for by FHWA procedures.

Needed Maintenance Not Performed

Both Louisiana and Michigan did not perform all needed maintenance work, and thereby affected the structural integrity of the roadway. In Louisiana, state transportation officials told us that all needed maintenance had not been performed because of lack of funds. FHWA was aware of the problem as its Fiscal Year 1986 inspection reports revealed serious maintenance deficiencies. Their summary of Interstate maintenance inspections showed 39 different types of maintenance deficiencies including pavement blow-outs[2], poor skid-resistant surfaces, unsealed joints, ruts, and damaged guardrails, which potentially affect the structural integrity of the road and user safety. In addition, FHWA's analysis of state budget information showed that funding for maintenance supplies had declined by 34 percent over the past 3 years and the number of maintenance employees had been reduced by 23 percent in the past 18 months.

In 1987, FHWA concluded that Louisiana had not adequately maintained its Interstate highways. Consequently, FHWA suspended

---

[2] Pavement blowouts are defined as the crushing and upward movement of concrete pavement at the joint area that causes the adjoining slabs to raise up, or in many cases shatter, becoming a safety hazard needing immediate attention.

approvals of certain agreements and authorizations, such as the approval of a consultant agreement for preliminary engineering and/or right-of-way authorizations. Responding to the threatened cutoff of future federal funds in 1987, the state channeled about $10 million to Interstate maintenance and over $11 million to provide needed maintenance on other Federal-aid highways. The state also began efforts to earmark revenues from the state gas tax towards highway maintenance. These state actions resulted in FHWA lifting the federal funding restriction. But, the earmarked revenue envisioned in 1987 did not materialize, and Louisiana proposed substantial reductions in its maintenance work. FHWA again responded by denying approval of certain authorizations. In June 1989, the passage of a gas tax amendment offered hope that the state would be better able to meet its maintenance needs. As a result, the federal funding restriction has been lifted.

In Michigan, the state did not perform all needed routine maintenance in the following areas: sealing pavement cracks and joints, painting bridges, and replacing or repairing damaged guardrails and right-of-way fences. A Michigan transportation official told us that not all needed maintenance work had been performed, much of which was related to the structural integrity of the roadway. FHWA was also aware of this needed work through inspections, but concluded that the overall maintenance effort was acceptable. State and FHWA officials also told us steps had been taken to partially correct the deficiencies. For instance, at

FHWA's request, Michigan has begun to do more bridge painting to prevent premature deterioration. However, a state official stated that maintenance funding is not expected to be sufficient to eliminate the maintenance backlog. In addition, this official told us that an increase in the state gas tax of about 2 cents per gallon for three years, for a total of 6 cents, would be needed to reduce the maintenance backlog. He did not expect an increase to be considered during this legislative session.

Deferral of needed maintenance work was not evident in California. A California state transportation official said that they were able to keep up with maintenance needs, and FHWA concurred. However, he cautioned that because of rising maintenance costs, the state may be hard-pressed to meet future maintenance needs. California is also trying to increase its gas tax.

Inadequate follow-up

FHWA documentation indicated no evidence of follow-up action for at least 25 percent of the deficiencies identified in Interstate maintenance inspection reports by staff engineers in Michigan and California during fiscal year 1989. Some of the deficiencies were safety related such as missing signs and signals, damaged guardrails, and illegal median crossings. In discussing the issue of follow-up, FHWA field managers indicated that they

were unaware of the insufficient follow-up. They stated that management review procedures would be implemented to assure that follow-up would be improved so that all deficiencies are resolved in a timely manner. For example, FHWA California division officials plan to utilize a computerized summary to identify unresolved deficiencies and determine the adequacy of follow-up action at monthly management meetings.

LANE WIDENING ESTIMATED TO ACCOUNT FOR A LARGER SHARE OF FUTURE 4R FUNDS

According to DOT's biennial report to the Congress, funding requirements for the 4R program significantly exceed the current funding level of $2.8 billion a year. The Department estimates the program will need federal and state funds totaling $4.7 billion to $6.1 billion annually through the year 2005. If the federal cost-share remains at 90 percent, the required federal investment will be between $4.2 billion and $5.5 billion annually.

Widening the existing Interstate system must be addressed along with the important need to arrest pavement deterioration of the existing system. Reviewing the Department of Transportation's estimate of 4R funding needs, we observed that the funding estimate projects that states will need to spend about 50 percent of the 4R funds for major widening and the rest primarily for improving existing pavement.

As congestion on the Interstate worsens, expansion needs on the Interstate are expected to grow tremendously in the next several years. The 4R program may increasingly be used to respond to these needs. Therefore, the potential increase in widening activities could change what has been basically a pavement preservation program into a program that will also include a significant lane widening element. Specifically, if about 50 percent of 4R funds are spent for major Interstate widening, this spending would represent a significant departure from historical spending trends. In 1981, less than 1 percent of 4R funds was spent on major widening. In fiscal year 1989, 13 percent was spent on this activity.

The Department's estimate of future annual funding needs far outstrips the current 4R funding level of $2.8 billion per year. Furthermore, the Department estimates that lane widening of 11,000 to 15,000 additional Interstate miles is needed, but is not included in the $4.7 billion to $6.1 billion estimate because of right-of-way constraints. The Department makes reference to other transportation strategies, such as transit, compensating for the expected lane widening shortfall of 11,000 to 15,000 lane miles. However, no information is provided on the extent to which such alternative strategies could respond to this lane widening shortfall and at what costs.

OPTIONS MERITING CONSIDERATION

Mr. Chairman, almost half of the Nation's premier road highway system may be in barely tolerable or worse condition. Further, due to funding difficulties, some states have not performed needed maintenance to slow pavement deterioration and reduce 4R costs. In light of the Department's estimate of the need for a significant increase over current 4R funding levels, which will only hold the line at 1985 pavement conditions, program modifications need to be considered to more effectively use the 4R dollar.

As your subcommittee deliberates the reauthorization of highway programs, you may wish to consider:

-- establishing national goals for the maximum acceptable levels of poor and fair pavement;

-- redefining the range of activities eligible for 4R funding to encourage states to give more attention to maintenance activities directed at preserving the Interstate pavement or resolving safety-related deficiencies;

-- emphasizing Interstate priorities through maintaining the 90 percent federal cost share on those projects that have numerous beneficiaries, and decreasing the

cost share on those projects that have a limited number of beneficiaries; and

-- requiring an assessment of the extent to which alternative transportation strategies are expected to alleviate the expected shortfall in Interstate lane widening and associated costs.

Mr. Chairman, this concludes my testimony. I will be happy to answer any questions.

TESTIMONY OF FRAYDUN MANOCHERIAN
President of
THE MANOCHERIAN-ROBBINS FOUNDATION, INC.
on
A POSITIVE APPROACH TO HIGHWAY SAFETY

Presented to the
Subcommittee on Roads
of the
Committee on Public Works
U.S. House of Representatives

Mr. Chairman:

The privilege today to speak before you is in itself a great reward for my efforts of almost twenty years toward reducing the tragedies and injustices occurring on the American highways. My name is Fraydun Manocherian. I am the author of the book FLESH, METAL & GLASS dealing with the problems on the road and suggesting solutions to alleviate them. This book is presently being distributed free by The Manocherian-Robbins Foundation, Inc., which was founded in 1962. The purpose of the above Foundation is highway safety.

As an immigrant from Iran, for the past twenty-four years I have enjoyed the great privileges of living in this country. The greatest of all attributes of this country, in my opinion, is its sense of justice and the fact that a man is innocent until proven guilty beyond a shadow of a doubt. This country is committed to protect the innocent from execution with unlimited funds. There is, however, one great mass injustice about which the country has been comparatively negligent. Among the 147 people killed and the

thirteen thousand six hundred people injured daily in automobile accidents, the majority are totally innocent. This in fact constitutes the greatest of all American tragedies and shows mass neglect on the part of this great country to do everything possible at any cost to save innocent lives. Chances are that in a two-car collision killing six people, only the driver of one car has been at fault and the other five people have died totally innocent of any wrong doing.

The major reason for such laxity on the part of the government is the lack of consciousness of the public, including many leaders of our country to the dangers of the four-wheel musical room that carries us so conveniently to our destinations. We seem to forget that its improper use takes us to our final destination, OUR GRAVE. To die on the road is the only type of death that has come to be taken for granted and, in many instances, the only type of murder that goes virtually unpunished.

With no warred intended, this country spends billions of dollars to help produce airplanes for faster than sound transportation to maintain air supremacy. Is it not an inequity in priorities that fifty-six thousand deaths suffered by Americans each year get comparatively little money and attention? The fact that a great many useful lives are snuffed out violently, and the fact that two and a half million of those injured each year suffer disabilities, in many cases changing what could have been a useful life to society to a life that has to be sustained and cared for by society, does not seem to be given the attention it merits.

Billions of dollars per month are spent by the United States to bring justice around the world. What about justice for law-abiding innocent Americans on our highways?

We believe that additional funds allocated to the major criteria affecting highway safety - Road, Car and Driver - will help reduce accidents. And yet, as an example, while modest funds were appropriated to carry through the sixteen Highway Safety Standards of the National Highway Safety Bureau, the activation of many of these standards are pending the funding of such appropriations. Aside from the inadequacies of the funds directed to the cause of highway safety, wrong priorities are given to the funds allocated to the three factors aforementioned. It is a known fact that the driver is ultimately the cause of about 90% of all automobile accidents. It is also known that education has reduced incidents of accidents substantially among the driver educated, yet the concentration of the Federal Government is on the car, which we believe should be made safer, and on the road, which we also believe is imperative for safety.

Our disagreement lies with the lack of attention given to the one hundred fifteen million drivers. Driver education courses are being taken by approximately 50% of our high school students. The great efforts of the National Safety Council in this direction has one million drivers enrolled in its Defensive Driving Course. However, the total number of people taught in this and all other ways comprises only a small portion of the total of one hundred fifteen million drivers and completely ignores our non-driving

38-253 O—91——58

citizens and children who have not reached driving age. Pedestrian education could also prove effective in the reduction of approximately ten thousand pedestrian deaths yearly, most of whom are children and senior citizens who have never had a driving license. It must also be taken into consideration that the knowledge attained in this way does not remain with the individual indefinitely for the same reasons that we cannot remember all that we learned in school years ago. This, coupled with the fact that most of the people taking such voluntary courses are the ones who least need them, has led us to suggest the following course of action, not to supplant but to augment the present efforts toward safety on the road.

In 1969 alone, fourteen thousand more Americans died on our roads than have been killed in the Vietnam war since it since its inception. This is not to belittle the severity of the war in Vietnam but to bring to light the seriousness of our highway safety problem in comparison.

We respectfully propose that a national education campaign on television and all other mass media be waged by an agency of the Federal Government to combat this growing horror by reaching, educating and making the entire nation conscious of the problem on a continuous basis. Also, the proposed organization would have the continuous means to pass on to the public research and other findings helpful in driving safety. Written materials such as our book are available to people for the asking; but, unfortunately, the people that seek and read such materials are the people who

least need them. If any such material were to be offered to the person who is the menace on the road, such a person would be likely to be insulted by such an offer. The solution to this problem necessitates a captive audience to whom such materials of safety can be brought in small portions and on a continuous basis. The audience of the most popular shows at the most popular time of day would be an example of such captive audience who could be taught pointers on better driving or pertinent laws rather than be persuaded to purchase a particular product during the commercial break. The CBS Drivers Test of 1966, in which 40% of the national driving participants failed, is great proof that the majority of the public must improve the level of their driving safety. Our Foundation conducted a test among two hundred drivers with the only question being asked, "What would you do if the rear of your car skidded to the left?" We found that the majority of the two hundred admitted they did not know what to do or gave the wrong answer. Millions of drivers could be exposed in one minute to the answer to this critical question if a professionally produced package, through audio-visual means, presented the knowledge to a captive audience at such commercial time as aforementioned. The present efforts are taking matters of highway safety to Channel 32 at 7:00 a.m. and selling deodorant on Channel 4 at 9:00 p.m. Does this priority given to the product versus innocent lives seem to you to be correct?

The major reasons for accidents caused by the driver are:

1. Use of bad judgement

2. Incompetent driving

3. Disobedience of the law

4. Lack of knowledge of the law

Such national campaign could:

1. Dramatize the importance of the use of good judgment and show cases of bad judgment and its horrible results.

2. Teach good driving techniques and warn against prevalent driver actions causing accidents.

3. Convince the driver that it is in his best interest to abide by the law.

4. Teach and remind the driver of the laws and regulations.

By taking advantage of the audio and visual means of such a campaign and through repetition, the program should achieve what every major advertiser in this country achieves - SUCCESS.

We are aware that broadcasters are by law required to give some free time to matters of public safety and that they are more and more using this time for purposes of highway safety. While this action is most commendable, it is totally inadequate. The educational campaign necessary, if it is to be significantly effective, must sponsor prime time television shows and, using all other effective media, reach out to a cross section of the population using commercial time in the best interest of an for the safety of the public. Such a campaign would be expensive, and such expense must be continuous to be effective. To fund this program, we propose that legislation be passed to increase the Federal gasoline tax by one tenth of one cent per gallon. Such an increase

would impose a two cent tax increase on a 20 gallon gas purchase and would cost an average of 85 cents per car per year, while each person would pay according to the extent of his road usage.

Through such minimal taxation, and without touching present funds, the proposed organization would be empowered with eighty-five million dollars of trust fund annually for this purpose, increasing each year as the number of cars and the number of miles driven increases. This type of campaign, aside from its specific educational benefits, would make the public and our leaders more conscious and aware of the hazards on the road and emphasize the necessity for a more responsible attitude towards driving and highway safety. Such consciousness is a prerequisite to a great breakthrough toward better chances for survival on the road, and the consciousness of the leaders in all levels of government will make the passage of needed laws and the enforcement of laws pertinent to highway safety more certain.

A couple engaged to be married this June was driving to a party given in their honor. A drunken driver out of control veered from the opposite lane, killing both the bride and the groom-to-be. Tests on the drunk established a blood level of 14 points which, in that State, as well as 24 other States of the Union, is not considered drunk. At 10 points, the National Safety Council describes the average man in a state of confusion, staggering gait, and slurred speech. Yet the States that virtually give a license to the drunk drive by allowing a 15-point level are reluctant to reduce their standards immediately. The national education and

awareness program, we suggest, could help these leaders to take this and similar steps on their own initiative.

Contrary to most tax proposals, this proposal, if enacted, aside from its life and limb saving benefits, would save the public a minimum of sixty-five million dollars annually. While many tests, including one conducted in Illinois in 1963 involving five hundred thousand drivers, show improvements of up to 50% in reduction of accidents through driver education, our proposed type of education would be conducted more professionally and continuously with cumulative effect. For the sake of presenting what we believe is an unquestionable case, we will theoretically take not 30%, not 20%, not even 10%, but a minimum of 1% of general effectiveness, for an annual eighty-five million dollars of national educational and awareness program to prove our point. On that unrealistically conservative basis, we find that 1% of fifteen billion dollars, which was the cost of traffic accidents in 1969, is one hundred fifty million dollars. Therefore, the program, even with only a 1% overall effectiveness, would unequivocally save the American public lives, injuries and an absolute minimum of sixty-five million dollars and afford every citizen a better chance of reaching his destination on the highways and byways already built and yet to be built.

Together with this report, I submit to you a copy of the first edition of our book FLESH, METAL & GLASS and a copy of our advertisement as it appeared in The New York Times on May 20 and May 24 1970, offering our book free and asking for public support

of this program.

The response was beyond our most optimistic expectations. Among the tens of thousands of letters received to date from all over America, there has not been one single letter voicing objection to our proposal. We have been deeply moved by the many telegrams and letters of support received from Governors and legislators all over the country. That response has fueled our enthusiasm to dedicate a lifetime, if need be, to put into effect what we believe will inevitably reduce death and injuries on our highways.

Not long ago a man, his wife, his twelve-year-old son and nine-year-old daughter stopped on the Long Island Expressway when their car became disabled. Their car was struck from behind, setting it afire. They scrambled out of the car, that is, they, except the twelve-year-old boy who was pinned by the impact of the accident. Frantically his parents and his nine-year-old sister repeatedly surged into the flaming car to extricate the agonized young boy. Injured through many attempts, they were forced to watch as the fire consumed the child into ashes. Gentlemen, is it just possible that had it been emphasized to this driver to pull his disabled car off the road, that this tragedy would not have happened? That this boy, in the spring of his life, would not have died and that his family would not have to live a life of grief?

We are aware of the national and international problems of this country and your involvement in their solution. But the untimely sudden deaths of 147 Americans <u>daily</u> cannot await the

resolution of all other problems.

In this proposal we are not asking for any diversion of funds or, in the final analysis, any expenditure on the part of the public or the government. The question at hand is that, if we can save lives, reduce injuries, eliminate much grief and ultimately save billions of dollars, should we? If the answer is yes, we urge you to consider this proposal very carefully. Procrastination to take any step to reduce this great mass injustice taking an American life every nine minutes around the clock and around the calendar shows a lack of awareness of this carnage and the number one disabler of Americans of all ages.

For the sake of justice we have made this plea. For the sake of justice we ask you to act upon it. Thank you.

THE MANOCHERIAN FOUNDATION, INC.
475 PARK AVENUE SOUTH 212-683-9800 NEW YORK, NEW YORK 10016

The Manocherian Foundation

The Manocherian Foundation is a non-profit organization (Federal Tax-Exempt #13-6128274) dedicated to reducing accidents, death and disability on our highways by promoting safe driving habits through public awareness. The Manocherian Foundation was established in 1962 by Mr. Fraydun Manocherian, who as a high school student lost two friends to a drunk driver.

Traffic accidents are the #1 killer of Americans aged 1-34 and the #1 disabler of Americans of all ages. This year, over 48,000 Americans will die in car collisions -- more than we lost in all ten years of fighting in Viet Nam!

Recognizing that 90% of all car accidents are caused by the driver, the Foundation has produced over 30 driver safety messages for television and radio which emphasize safe decision-making. Messages currently airing on national television focus on seatbelt safety and drunk driving, including: "Seatbelt Safety" (winner of the 1990 American Film Association psa category), "Russian Roulette," "The Executive Drunk" and "Liquor 2". Future messages will address driver judgment involved in other causes of accidents, beginning with tailgating.

Current film projects include "The Aftermath," a 25-minute documentary about Bruce Kimball, the Olympic diver who drove drunk through a gathering of teenagers, killing two and injuring several others. "The Aftermath" will be distributed to all high school in the nation and is the newest component of Governor Cuomo's Athletes Against Drunk Driving Campaign, and is being adopted by law enforcement agencies, universities and substance abuse groups.

For thirty years Mr. Manocherian has worked with legislators, the National Highway Transportation Safety Administration and other groups to effect national standards in driving competence. Mr. Manocherian has testified before Congress several times advocating mass-media educational efforts to promote driver safety.

The Foundation provides the accredited driver safety manual, "Flesh Metal Glass," authored by Mr. Manocherian, free of charge to driver education classes, schools, institutions and individuals.

For his dedication and accomplishments in the field of auto safety Mr. Manocherian has received the "Man of the Year" award from the New York Council for Civic Affairs, an Honorary Doctorate of Humane Letters from St. 's University and a Masters of Arts degree from the International University of Communications in Washington, D.C.

'The Aftermath': A Film's Real-Life Lesson on Drunken Driving

By ROBERTA HERSHENSON

FRAYDUN MANOCHERIAN cannot forget two of his White Plains High School classmates who were killed by a drunk driver nearly four decades ago. The driver received a mere "slap on the wrist" as punishment, said Mr. Manocherian, a real estate entrepreneur and the president and founder of the New York Health & Racquet Club of Manhattan.

The Scarsdale resident devotes much of his time and resources to the cause of highway safety. The Manocherian-Robbins Foundation he founded with the help of Leonard J. Robbins, a now-retired Manhattan lawyer, pursues its goal of reducing the rising death rate on the nation's roadways through public-service advertising and legislative lobbying.

Now a foundation-sponsored film that educators are calling "powerful" and "overwhelming" will spread the organization's message statewide and to other parts of the country.

Chosen for Statewide Release

The film, called "The Aftermath," has been adopted for use in Governor Mario M. Cuomo's statewide Athletes Against Drunk Driving program, in which prominent athletes serving as role models discuss drug- and alcohol-abuse issues with groups of young people.

In addition, the Ardsley-based Student Assistance Services, which sends counselors into junior and senior high schools throughout the county, is "about to adopt" the just-completed 23-minute videotape for use in its Reduce Our Adolescent Drinking/Drugging and Driving program, said Larry Posner, the driving program's director.

"The Aftermath" was produced and directed by Mark Sadan, an Ossining photographer and film maker, with Mr. Manocherian as executive producer. Larry Miller of Greenburgh edited the film, while Ray Seti, a Manhattan-based graphic artist and animator who also lives in Scarsdale, served as a video consultant.

No gore, no bitterness. Just pain on all sides.

Mr. Seti also created a 30-second animated public-service announcement advocating seatbelt use, one of four announcements sponsored by the foundation that have been adopted for broadcasting on CBS starting in May that can be seen now on several local stations.

Another who contributed to "The Aftermath" is Carly Simon, the popular singer who introduces the film; her song, "I Haven't Got Time for the Pain," is also heard on a sound track with other music by Frank Loch.

The film explores the consequences of a devastating and much-publicized automobile accident, caused by the Olympic diver Bruce Kimball on a summer night in 1988 in Brandon, Fla., which is near Tampa.

Mr. Kimball, who won the silver medal in the 1984 Olympics, drove his car into a group of suburban teenagers who were standing on the side of an unlighted section of roadway at a popular meeting spot. Two young people were killed and two others severely injured in the accident.

A 17-Year Sentence

The driver, whose blood alcohol level was found to be twice the legal limit, was convicted of driving while intoxicated and charged with two counts of manslaughter. He is now serving a 17-year sentence in a Florida prison.

Through interviews and news footage, the film concentrates on the physical and emotional pain suffered by the victims and their families, showing as well the apparent torment felt by Mr. Kimball and his family. There are no actors in the film, which was shot mostly in Brandon, except for teenagers who simulate the pre-crash gathering.

That segment, using Westchester teen-agers and shot in Ossining with the cooperation of the Briarcliff Manor and Ossining Police Departments, opens the film.

'Here One Second, Gone the Next'

A nurse who lives in Brandon and was the first to arrive at the scene quietly describes the "blood running down the gutters" after the accident. This is perhaps the most gory moment in a film that dwells less on carnage than on reflection.

"How could this happen?" asks the fiancee of a 19-year-old who was killed. "We were good kids. We had a lot of things in our lives." She fights tears and adds, "I couldn't understand how he could be here one second and gone the next."

Roberta Hershenson

Fraydun Manocherian helped found a foundation to promote the cause of highway safety.

Nor is bitterness or hatred shown toward Mr. Kimball. The judge who sentenced him calls him "a fine young man" who was "never convicted of any offense in his entire life." A sister of an injured boy says she hopes the driver can get his life "back together" and help other people.

The father of a man who died, however, makes the film's — and the foundation's — point. His son was dead, he said, "because someone chose to drink irresponsibly and went out and drove an automobile and killed our son just as though they had shot him."

The film — without the introduction by Ms. Simon or closing remarks by Mr. Manocherian, which had not yet been edited in — was shown several weeks ago at Pace University in White Plains in an Athletes Against Drunk Driving program. The event was co-sponsored by the school's Students Against Drunk Driving chapter.

Dave Jennings, a former New York Jet who is now a CBS radio sportscaster for the Jets, presented the film

'Aftermath': A Real-Life Lesson

Roberta Hershenson

Dave Jennings, a former New York Jet player and now a sportscaster, talking with viewers after a showing of the film "The Aftermath" at Pace University. At left is Mark Sadan, producer and director of the film.

and explained his own involvement in the program. "I lost a friend in the National Football League and also a few friends in college" to drunk-driving accidents, he told about 35 students.

"This is about as powerful a film as I've ever seen," Mr. Jennings added. "Athletes think they're superior, that this can't happen to them."

The film maker and editor were also present. "Making this film was like working with people who had been in a war — who had been bombed or hit by terrorists," Mr. Sadan told the group.

Joseph Sergi, a Pace sophomore who organized the campus's SADD chapter, said he "saw people crying" during the film. Bob E. Gerry, a junior, said he liked it because "it gave the perspective of the driver," while Katrina Segreto, another sophomore, said she believed the film would "absolutely be a deterrent to drinking and driving." It should be shown to student drivers "when they finally get to interact with traffic," she suggested.

Handling the Film's Impact

Adele V. MacDonald, director of the Manocherian-Robbins Foundation, noted that because of the film's emotional impact, some educators were wary of presenting it "cold" to students. Mr. Posner, of the Student Assistance Services Driving Program — which is financed by the Westchester County Stop-DWI Program — said that "we'd never show it during the last 23 minutes of class; it requires discussion."

The film "has to evoke lots of feelings for any child who has ever suffered a loss of any kind," Mr. Posner said.

At Brandon High School in Florida — the school the victims had attended — Ed Lucker, the school's drug coordinator, said he expected "The Aftermath" to be used not only in driver's education classes, but also in "law studies" courses, because of "the manslaughter and DWI issues" that are raised. He, too, advised leaving "time to get people's feelings out" after the film is shown.

Mr. Lucker also noted that groups at several Florida universities had asked to use the film, as had the Mendez Foundation of Tampa, an organization that combats drug abuse.

Mr. Manocherian, the author of the paperback book, "Flesh, Metal and Glass," published by his foundation and now in its fifth edition, is concerned with the whole spectrum of unsafe driving. In an interview at his home, he pointed out that drunk driving was involved in half of all fatal accidents. That leaves another half caused by such factors as tailgating, driver inattentiveness (lighting up a cigarette, searching for a radio station) and uncertainty about what to do when certain hazards arise.

Figures the foundation obtained from the National Highway Safety Administration show that the country's highway death rate rose to 47,093 in 1988, the latest year for which statistics are available, from 43,825 people killed in 1985. Mr. Manocherian said he hoped to reduce the numbers with a psychologically sophisticated education program presented through the media and aimed especially at drivers 18 through 34 years old, among whom automobile accidents are the most common cause of death.

The goal of the Manocherian-Robbins Foundation, he explained, is to establish a national program that would be supervised by the United States Department of Transportation and that would use "Madison Avenue techniques" to "educate the public in all matters of safety on a continuous basis."

'Making this film was like working with people who had been in a war.'

The foundation has prepared a position paper, to be presented to members of Congressional transportation committees, that proposes financing a $150 million media advertising campaign with a 1 percent allocation from the Federal Highway Trust Fund.

The Results Expected

The fund was created by Title 2 of the Highway Revenue Act of 1956 and is financed by the Federal gasoline tax and a variety of automobile, truck and trailer fees. The 1990 appropriation for the fund, which is administered by the Federal Highway Administration, a division of the Department of Transportation, is $15.9 billion.

"All the experts agree that this kind of education would bring a 5 percent reduction in the $70 billion in lost wages, insurance costs and related damages" suffered by Americans, in addition to the pain of injuries and the loss of loved ones, Mr. Manocherian said.

"Five percent of $70 billion is $3.5 billion in savings," he said. "Even if it were only 1 percent effective, the saving would be $700 million."

Testimony and Hearings

Mr. Manocherian said he expected to testify this month in Washington at hearings held by Representative Norman Y. Mineta, Democrat of California, head of the House Authorizations Subcommittee on Surface Transportation, and by William Lehman, Democrat of Florida and chairman of the House Appropriations Subcommittee on Transportation and Related Agencies.

He said he also planned to submit written testimony to Senator Frank R. Lautenburg, Democrat of New Jersey, chairman of the Senate Appropriations Subcommittee on Transportation and Related Agencies.

The foundation hopes to persuade Congress, as well as the President and the Department of Transportation, "to take a portion of the money slated for highway construction and repair" and divert those funds to an education program, Mr. Manocherian said. ■

DEATH, DESTRUCTION AND DOLLARS:

Why We Urgently Need
A Strengthened Public Education Campaign
To Improve Driver Competence and Judgment
and Knowledge of Laws and Regulations

A Proposal of the Manocherian Foundation

April, 1990

The Manocherian Foundation
475 Park Avenue South
New York, New York 10016
Mr. Fraydun Manocherian, President

EXECUTIVE SUMMARY

Each year motor vehicle accidents continue to be the number one killer of Americans ages 1-34 and the number one disabler of all Americans. In 1988 alone*, there were 6.8 million traffic accidents, which killed 47,083 Americans and injured another 3.4 million. One out of every three vehicles was involved in an accident--and the number of accidents has increased by one half million since 1986. In addition to enormous human suffering and loss, these accidents have cost American society an alarming $75 billion annually.

GOAL

The Manocherian Foundation believes that a well-coordinated, intensive national effort can reverse the growing number of accidents, fatalities and injuries, and their staggering emotional and financial costs to American society. A ten percent decrease in the costs associated with highway accidents would save the nation $7.5 billion annually. Even a one percent reduction would save $750 million.

RECOMMENDATION

The Manocherian Foundation recommends launching an annual $150 million public education campaign emphasizing television and radio advertising to promote safe driving. This campaign would extend the national focus beyond current efforts to encourage seat belt use and discourage drunk driving. In addition, it would make drivers aware of other principal causes of accidents and ways to avoid them.

Critically important information regarding defensive driving is not being communicated at all in current media campaigns. Most efforts are aimed at discouraging drunk driving--a factor present in half of all fatalities and 9% of all accidents. Yet 90% of all accidents are caused by the driver. Clearly, driver judgment and competence is the critical factor which must be addressed next in order to reduce all other causes of accidents.

FUNDING

The campaign would be funded through the allocation of less than one percent of the Highway Trust Fund's fiscal year 1990 appropriation of $15.9 billion.

SUGGESTED IMPLEMENTATION

An 11-member committee under the jurisdiction of the Secretary of Transportation would be established within the U.S. Department of Transportation to direct the campaign. The committee, chaired by the Chief Administrator of the National Highway Traffic Safety Administration, would be comprised of two psychologists, two automobile industry leaders, two advertising industry executives, two educators and two others. Committee decisions would require seven members.

* Complete accident-related data for 1989 will not be available until May.

I. INTRODUCTION - AMERICA DESERVES BETTER.

Motor vehicle accidents continue to kill more Americans ages 1-34 than any other cause.[1] In addition, each year motor vehicle accidents disable more Americans of all ages than any other cause. In 1988 alone, 47,093 Americans lost their lives in traffic accidents in spite of achieving lower death rates per 100 million miles. This staggering death trend has risen steadily since 1985 as have the number of accidents, with one half million more crashes in 1988 than in 1986.[2] Indeed, in the past dozen years, our nation's highways have claimed ten times more American lives than were lost during the entire Vietnam war.

This paper will assess the latest available data regarding vehicular accidents and the staggering costs to American society of the injuries and deaths on our roadways. It is the contention of the Manocherian Foundation that traffic accidents--and the injuries, deaths and economic costs they spawn--can be dramatically reduced if Congress and the Administration make a cost-efficient allocation of about one percent of the federal Highway Trust Fund to bolster national public education efforts to promote safe driving.

---

1. Source: National Center for Health Statistics; detailed on page 17.

2. Source: National Highway Traffic Safety Administration (National Center for Statistics & Analysis, National Accident Sampling System, and General Estimate System).

By "safe driving," we mean driving soberly, intelligently, and with much greater competence--not only in the use of cars, but with trucks, motorcycles and bicycles as well. While many worthwhile efforts have been made to discourage drunk driving, alcohol and drugs are present in 50% of fatal accidents. We propose that a public education program extending the national focus beyond seat belt use and drunk driving would make drivers aware of other principal causes of accidents and ways to avoid them.

Knowledge of road conditions, perilous highway situations and pedestrian habits significantly enhances driver competence, but most drivers have shockingly little understanding of what behavior or conditions lead to serious accidents. They have even less knowledge of how to respond to dangerous conditions or threatening situations when they are confronted by them on the highway.

We propose that the U.S. Department of Transportation launch an intensive campaign to make drivers aware of other principal causes of accidents and, in understandable, practical terms, explain how drivers can successfully develop their judgment skills to avoid becoming part of the grim legacy of our nation's inattention to defensive driving.

II. DEATH, DESTRUCTION AND DOLLARS--THE HIGH COST OF VEHICULAR ACCIDENTS.

The hazards of driving or riding in a motorized vehicle, or simply walking across a street, are substantial. The staggering health and economic costs to American society of traffic accidents were assessed at over $74 billion annually in a 1987 study prepared by the National Highway Traffic Safety Administration (NHTSA).

TABLE I
1986 Crash-Related Injuries, Fatalities and Damage Costs

LOSS	# PERSONS/VEHICLES	COST TO SOCIETY
Fatalities	46,056	$16.50 Billion
Total Injured Persons	3,417,600	$17.46 Billion *
Property Damage Only (Vehicles)	45,458,618	$29.59 Billion
Uninvolved Vehicles (Insurance Overhead)	109,714,320	$10.64 Billion
	TOTAL	$74.19 Billion

* Additional breakdown of costs to society provided on Page 18.

In the study year, more than 45 million vehicles out of some 154 million on the road were damaged in accidents--that's nearly one out of every three vehicles! The 46,056 Americans who died and the 3.5 million who sustained injuries ranging from minor abrasions to permanent disfigurement and coma, hurt American society as well as themselves. Their illness and death robbed

$16.38 billion in lost productivity from our GNP; their collisions destroyed $27.37 billion in property and drove insurance costs up by $20.86 billion. By reducing accidents by only one-tenth, America could save almost seven billion, five hundred million dollars.

Even a one percent reduction in accidents would save society three-quarters-of-a-billion dollars. The Manocherian Foundation is convinced that our proposed program will rapidly achieve a reduction in accidents well in excess of one percent.

III. CURRENT EFFORTS TO SAVE LIFE AND LIMB -- TOO LITTLE.

The highway safety programs conducted by the federal government are funded by the Highway Trust Fund, which totalled $14.8 billion in 1988.* These programs are administered by the Federal Highway Administration and the National Highway Traffic Safety Administration (NHTSA). The Federal Highway Administration's safety programs focus on improving the highways themselves (e.g., highway engineering) and comprise $433 million, or 3% of the total Highway Trust Fund. The National Highway Traffic Safety Administration's safety programs focus on the driver and the vehicle, and comprise $159 million, or 1% of the Trust Fund. NHTSA redistributes $128 million of this amount in grants to each state Governor's Highway Safety office.

---

* 1988 Appropriations; detailed on page 18.

Of NHTSA's $30.3 million in federal Operations and Research funded through the Trust Fund only $1 million is expended to produce public service announcements related to safe driving. Collectively, the states spend another $2 million of NHTSA funds on production of PSA's to convey their own safety priorities to the public.*

Taken together, total federal and state PSA production dollars in 1988 amounted to less than two hundredths of one per cent of the Highway Trust Fund. Recognizing that traffic accidents are the leading cause of death among Americans up to age 34 and that 90% of all accidents are caused by driver behaviors that can be avoided, our preventive action to educate the public comprises a minuscule proportion of total highway expenditures.

During the past five years, NHTSA has leveraged the $1 million allocation for public education on highway safety to conduct two separate media campaigns in association with the Ad Council--one discouraging drunk driving and the other promoting seat belt use.[3]

NHTSA began its anti-drunk driving campaign in 1982 with "Drinking and Driving Can Kill a Friendship," followed by

---

* Primary Research.

3. A third media campaign by NHTSA, known as T.E.A.M. ("Techniques for Effective Alcohol Management"), features sports figures in anti-drunk driving spots. It has generated a total of $8 million in donated advertising during the past four years, but is not analyzed here because of its relatively small size.

"Crashing Glasses" in 1983. No new advertisements on this subject have been produced recently. During the past six years, the Ad Council has procured a total of $124 million in donated television, radio, print and billboard space for these campaigns. The awareness generated by these campaigns has supported other public programs and contributed to the steady decline of alcohol-related deaths as a percentage of total fatalities, which decreased from 52.2% in 1986 to 49.6% in 1988. (See details, page 20)

NHTSA's seat belt campaign began in 1985 with the speed prevention message, "55 Saves Lives," and the "Vince and Larry Crash Dummies." In 1988, the seat belt campaign attracted donations of $28.3 million in television, radio, print and billboard media. These messages have supported the effectiveness of new speed limit and seat belt laws, and helped increase seat belt use which, according to a 19 city survey, rose from 11% in 1982 to 47% in 1988.

While the effect of these campaigns is difficult to measure, data provided by Arbitron's Broadcast Advertisers Reports (Tables VI and VII*) shows that the core effort, television, was diluted substantially by virtue of non-prime time and low frequency airing assigned to public service announcements. In the nation's top 16 markets, only 9% of the seat belt messages were broadcast during prime time, with most messages less than

---

* Tables VI and VII appear on Page 20.

30-seconds long. Not only were the messages run in insufficient volume to produce major behavioral changes (at a rate of $124 million over six years), but they were run overwhelmingly in non-prime time (64% aired from 7AM to 5 PM, 14% aired from 11:30 PM to 6AM) and hence directed to a small and less appropriate audience.

What's more, critically-important information regarding defensive driving is not being communicated at all in the current media campaigns. The public education effort aimed at discouraging drunk driving relates to a factor present in half of all fatalities and 9% of all accidents. Many millions of accidents occur each year where all the parties involved are sober. This means that critically important information regarding the causes of the other half of all fatal accidents is not being communicated nationally. Lack of driver competence is the problem in most accidents, and it must be addressed.

IV. A PROPOSED CAMPAIGN TO SAVE THE LIVES OF AMERICAN MOTORISTS: THE TIME FOR DECISIVE ACTION IS NOW.

A. What needs to be communicated:

It is an established fact that the driver is the cause of 90% of all automobile accidents.[4] Of the 62,237 drivers involved

---

4. Source: NHTSA

in fatal accidents in 1988, nearly 80% had no previous accident record. Moreover, 82% of fatal accidents occurred during dry weather and normal driving conditions. These findings demonstrate that driver judgment and everyday behaviors are the most critical factors in accidents.

Despite these findings, federal programs concentrate on the car, which we agree should be made safer, and on the road, which we also agree is imperative for safety. Our concern lies with the lack of attention given to the driver and the role his judgment plays.

The proposed new media campaign would focus on the prevelant causes of highway accidents in addition to alcohol and drug abuse. These include driver inattentiveness, such as taking the eyes off the road to light or pick up a dropped cigarette; tailgating; dozing off at the wheel; as well as educating the public on how to address road hazards, such as skidding or blowouts. In summary, the new programs we propose would be geared to improve driver competence, judgment and knowledge of laws and regulations.

Indeed, many Americans have no idea how to anticipate which road conditions will cause skidding, or why and when a tire is likely to blow out. None of the current federal PSA campaigns address these and a whole range of other major causes of highway injuries and deaths.

The Manocherian-Robbins Foundation conducted a survey of two hundred drivers, asking, "What would you do if the rear of your car skidded to the left?" The majority of drivers admitted they did not know what to do, or gave the wrong answer. These are precisely the skills taught in driver education courses and assumed to be common practice among all drivers. Each year such assumptions prove deadly for thousands of innocent victims. This is because driver education courses do not reach the entire population of drivers and pedestrians, and much knowledge learned is forgotten over the driving lifetime.

While it is known that driver education reduces the incidence of accidents, only a small portion of America's 158 million drivers receives formal training. The National Safety Council annually enrolls less than 2% of the nation's drivers in Defensive Driving courses.[5] From 1983 to 1987, the percentage of the nation's public and private schools offering Driver Education declined from 80% to 69%. Further, during that same period, the percentage of eligible students enrolled in Driver Education decreased from 64% to 46.3%.[6] Driver education programs completely ignore non-driving citizens and children who have not reached driving age; proper education also could reduce dramatically the 7,000 pedestrian deaths each year, most of whom are children and senior citizens.

---

5. Source: National Safety Council.

6. Source: American Driver and Traffic Safety Education Association.

Secondly, it must be recognized that the knowledge attained in driver education courses--typically taken at age 16--does not remain with the individual indefinitely, for the same reasons that we cannot remember all that we learned in school years ago. Indeed, one out of every five drivers on the road today is over 60 years old.[7] This, coupled with the fact that most people taking voluntary driving courses are the ones who need them least, has led us to suggest the launching of an intensive campaign to reach those citizens who must be educated and re-educated if we are to reduce the mayhem on our nation's roads and highways.

Written materials such as the book, Flesh, Metal and Glass, published by the Manocherian Foundation, are available for the asking, but unfortunately, the people who seek and read them are those who least need them. Further, the offering of such materials to the problem driver would most likely be resisted. The solution to this problem requires reaching a captive audience to whom critical information can be brought in small doses and on a continuous basis.

To combat this growing horror, we propose that a national education campaign on television and radio, and in the print media be waged under the supervision of a unit of the U.S. Department of Transportation. The objective would be to make the

---

7. Sources: Bureau of the Census, Federal Highway Administration

entire nation conscious of the highway safety problem on a continuous basis. The mass audience tuned in to the most popular shows during prime time could be taught the elements of defensive driving in much the same way that members of the audience are being persuaded to purchase products.

We are convinced that a sophisticated, effective public education campaign can be mounted which will successfully penetrate the consciousness of the majority of American drivers, teaching them how to avoid highway hazards and how to effectively cope with them if they do occur. Such a campaign, centered on television advertising, must contain three critical elements:

1) it must be continuous;
2) it must be aired in prime time and otherwise carefully targeted to accident-prone drivers (e.g., adolescents);
3) and it must utilize state-of-the-art production values, such as top entertainers and athletes as spokesmen, and the best creative talent on Madison Avenue and in Hollywood.

A truly effective campaign cannot rely solely on Public Service Announcements broadcast on donated air time, as has been the case historically, but rather must be augmented by a substantial paid advertising budget, such as that used to promote the U.S. armed services.

Additionally, it would be helpful to feature actual survivors of automobile accidents or the families of those who perished as a dramatic means of conveying the terrible human costs of death or injury.

B. What It Will Cost and What It Will Buy.

Such a campaign, which would save this nation's citizens untold grief and suffering could be successfully mounted if the President and the Congress would agree to allocate less than one percent of the Highway Trust Fund to finance the kind of public education effort proposed above. This relatively modest investment would not only save lives, disability and untold pain, but would also save our society billions of dollars each year.

The Highway Trust Fund, created by Title II of the Highway Revenue Act of 1956, is financed by the federal gasoline tax and a variety of automobile, truck and trailer fees. 85% of this $15 billion Fund is generated by the gasoline tax (including diesel and gasohol), with the rest levied from the sale of tires, trucks, trailers, and heavy vehicles. (See details, page 21.)

As mentioned earlier, only $1 million of this budget is dedicated to producing PSAs at the national level. These campaigns are conducted in association with the Advertising Council, which arranges for an agency to create the ads on a pro bono basis, and coordinates their production and distribution. From 1983 to 1988, approximately $124 million in air time was donated by television, radio, publications, and billboard companies for the drunk driving campaign. In the past six years, an average of $25 million per year has been donated for the Seat Belt campaign.

However, the annual amount of donated free air time has varied enormously during this past six-year period (1983-1988). For example, in 1986, $34 million was donated for anti-drunk driving campaigns, but in 1987, only $1 million was donated in television, radio, newspaper, magazine and billboard advertising combined! In other words, there has been no consistent steady communication program focused to specific target groups.

A six-city pilot study completed by NHTSA in 1987 sought to compare the effectiveness of paid versus donated advertising.[8] While the presence of other supportive activities in the test localities rendered some of the study inconclusive, the results

---

8. Source: NHTSA, "Report to the Congress; Highway Safety Education and Information Project Prepared in Response to Section 209: Public Law 95-599, Surface Transportation Assistance Act of 1978"

for specific localities showed that:

1) messages aired on paid media produced more desired changes in driver behavior than did PSA's

2) paid messages were more frequently recalled

3) a comprehensive approach to community traffic safety, including media programs, appears to be the most effective method of altering driver behavior.

A one percent allocation from the Highway Trust Fund's appropriation of $15.9 billion will yield approximately $150 million. If such an allocation were used mainly to finance a television advertising campaign, it would match the size, sophistication and effectiveness of the campaigns waged by General Motors Corp. But instead of selling commercial products, that time would be used to save lives, prevent injuries and disabilities, and save billions of dollars. How can we, as a society, not quickly embrace such an undertaking? It is either such an undertaking or the undertaker for tens of thousands of our children, friends and loved ones, year in and year out.

Placing $125 million of this proposed budget on television advertising would buy approximately 12 billion impressions--reaching tens of millions of viewers repeatedly. An additional $25 million for a radio and print campaign would buy another 7.5 billion impressions. Only by making Americans among the most sophisticated motorists in the world can we realistically hope to change driver behavior and reduce the slaughter on our highways.

C. Implementation:

To implement this effort we recommend that two entities be established.

An 11-member committee under the jurisdiction of the Secretary of Transportation would be established within the U.S. Department of Transportation to direct the campaign. The committee, chaired by the Chief Administrator of the National Highway Traffic Safety Administration, would be comprised of two psychologists, two automobile executives, two advertising executives, two educators and two others from private foundations dedicated tc highway safety. Committee decisions would require seven members. Each committee member would receive $1.00 per annum.

Second, tremendous gains can be achieved in each of the 50 states through the establishment of a national clearinghouse for driver safety public service announcements. This voluntary

clearinghouse would be a central resource for the states, federal government and localities to draw upon. It would feature a comprehensive inventory of all safe driving television, radio and print ads produced by the federal government, states, localities and by civic, medical and academic organizations. In many instances, states or localities could utilize materials from this "ad bank" rather than spend money to produce new materials. In this way, cost-efficiency with maximum impact will be achieved.

The Manocherian Foundation is prepared to work with the Congress, the President and the Department of Transportation to win public support for such an endeavor, which we believe will be enthusiastically embraced by the American people. The time for concerted action to bring an end to the carnage on our nation's roads is now.

Statement of the

Outdoor Advertising Association of America, Inc.

by

B. Roland McElroy, President

Regarding the Reauthorization of the Highway Beautification Act

Prepared for the

Subcommittee on Surface Transportation

United States House of Representatives

April 24, 1990

I am Roland McElroy, President of the Outdoor Advertising Association of America. The OAAA is comprised of 200 outdoor advertising companies which operate in over 7,000 communities throughout the United States. These companies range in size and complexity from small localized companies, often managed by the second or third generation of family ownership, to large publicly held companies with diverse interests in media and other businesses.

In all, OAAA members maintain approximately eighty percent of the estimated 500,000 sign structures to be currently in existence.

Nationwide, the industry and related businesses employ well in excess of 100,000 people in a broad spectrum of professional and skilled jobs.

The companies in our Association provide a medium for hundreds of thousands of businesses of all sizes offering a wide range of products and services.

Outdoor advertising <u>is</u> important to these advertisers because it is a uniquely - cost effective vehicle for reaching the public.

Companies utilizing this medium generate sales and provide employment for millions of Americans. In short, our industry is an essential element of commercial life in a free society.

Political candidates, public interest and charitable institutions also rely on outdoor advertising as a means of expressing their First Amendment rights. Last year our members provided approximately ten percent of their signs free for public service messages by many worthy causes. The estimated value of this contribution exceeded $140 million.

I have been President of the OAAA for one year. I entered this job with few preconceived notions about the billboard industry. But I am continually surprised by the half-truths and distortions of fact that are perpetrated about this most basic of communications media. Frankly, the Association has long awaited this opportunity to go on record before this Committee to discuss the facts regarding billboard regulation under the Highway Beautification Act.

It is important that you know what the OAAA support's and what

we oppose.

The OAAA believes that billboards are compatible with other commercial land uses and should be located in commercial or industrial areas. But, we do not support the establishment of special zones carved out of rural environments solely to permit outdoor advertising - so-called "bogus zoning".

The OAAA supports enforcement action to eliminate illegal signs that have been erected without authorization.

The OAAA supports the right of all to advertise lawful products, as well as noncommercial and political messages. In this regard there has been much erroneous publicity about billboards and cigarette advertising. But the fact is that relatively few of our members' signs actually carry cigarette advertising - the nationwide average is approximately 10%.

Finally, we are against the unauthorized cutting of vegetation along the highway right-of-way, and we support effective enforcement activity at the state level to prevent these abuses.

We do support the Highway Beautification Act. The record

demonstrates that this law has worked and that it retains its vitality as the core regulatory device for controlling billboards on the nation's principle federal highways. If the Committee closely examines the issues regarding the Act that have been raised in these hearings, it will find that they are largely unsupported or based on anecdote. In candor, there are clearly pockets where problems remain. But in the final analysis they are due to inconsistent or lax enforcement and do not reflect fundamental flaws in the basic regulatory scheme established by the Act.

On the surface, it may seem disingenuous to some for an industry to argue that a law which regulates it may also serve the public interest. Indeed, the fact is that the just compensation provisions of this statute are of critical importance to billboard owners. But, as I will explain in greater detail, this aspect of the statute simply reaffirms a basic tenant of the Bill of Rights which guarantees to every individual and every business in this country the basic right to be compensated when property is expropriated by governmental action. That is the core interest

that the OAAA seeks to preserve and that is the fundamental reason why we support an Act which otherwise imposes substantial constraints on our business. It also reflects the essential balance that was struck by the Congress in enacting this statute. Our opponents want to upset this balance because they say "things have regressed terribly". Allow me to tell you how things have in fact changed.

In 1965 there were 1.1 million billboards along our cornerstone Interstate and federal aid primary highways. Since that time, over 710,000 billboards have been removed, including 95% of the illegal structures in existence in 1965. At the same time that this dramatic contraction of signs has occurred, the miles of interstate and primary highway have expanded significantly. When new billboards have been constructed, they have been confined to commercial or industrial areas under tight constraints and pursuant to state and local authorization. Despite these gains, there are still some illegal billboards and some signs are located in genuinely scenic areas or in other inappropriate locations. But

we believe that the number of such signs is small and these few remaining exceptions can be readily eliminated through effective enforcement action or cooperatively negotiated removal programs.

Indeed, there is much evidence that the statistics that have been bandied about regarding the number of problematic signs is grossly inflated and unreliable. For example, out of 33,094 illegal signs that the U.S. Department of Transportation has identified as still in existence, 11,000 alone are supposedly in the state of Iowa! Mr. Chairman, I don't know what those signs are, but they are not billboards.

The state of Arizona reports that there are 658 nonconforming signs rather than the 3,500 reported by DOT.

A sampling of Pennsylvania's statistics reveals that the number of nonconforming signs in that state is overstated by a factor of one-third.

CALTRANS recently reported that of the total nonconforming signs reported in that state by DOT, only 12% were standardized billboards.

In testimony before this Subcommittee even proponents of billboard prohibition admitted that they were not confident they had reliable statistics for many of their assertions.

Without dismissing those instances where problems remain, we are confident the Committee will not permit itself to be manipulated by hyperbole nor will it conduct a serious evaluation of the Beautification Act based upon anecdotes and exceptions.

For now the true efficacy of the Highway Beautification Act can be best measured by the data available regarding removals, which is accurate, and by the fact that in 1990 - twenty-five years after the first implementation of the Act - the public simply does not identify billboard control as a pressing environmental problem.

During the week preceding Earth Day, the news media were full of stories about the major environmental issues facing Americans. None of the opinion surveys reported mentioned billboards as an environmental concern of Americans. For example, the Gallup Earth Day poll, conducted April 5 - 8, 1990, citizens were asked to list their major environmental concerns. No one named billboards.

Indeed, during the Earth Day celebrations last week, billboards were used by local sponsors in many areas to promote environmental awareness.

One of the myths regarding the Highway Beautification Act is that it has in some respect created a barrier to the ability of localities to regulate outdoor advertising effectively. That is not so. Under the framework of the Highway Beautification Act, the Department of Transportation, through individual agreements with the states, has established minimum criteria governing the location and size of billboards contiguous to Federal aid primaries and Interstate highways. In summary, those regulations require that billboards must be located in bona fide commercial and industrial areas, that billboards must be spaced a specific number of feet apart, and that they cannot exceed a specific size and height.

It is important to note also that illegal signs have no valid status under the Act and are not subject to the just compensation provisions.

Contrary to testimony before this Committee, the statute does

not authorize the construction of billboards in national parks or historic sites.

Again these are minimum standards only. Section 131(k) specifically preserves the authority of the states and their political subdivisions to impose more rigorous restrictions or to prohibit outdoor advertising completely. Indeed, I am unaware of any significant jurisdiction that does not currently impose restrictions on the size and location of billboards. Furthermore, nothing in the law prevents a state or locality from prohibiting billboards entirely. And although it is not a happy state of affairs for us, four states and a small number of localities have done just that. But those jurisdictions are in the distinct minority. The very broad majority of communities in this country have balanced outdoor advertising within their overall commercial plan.

The other great myth that is perpetrated by those whose real agenda is to eliminate and not regulate billboards is that the just compensation provisions of the Beautification Act have undercut

some otherwise clear authority of government to take signs without paying for them. The Executive Director of Scenic America recently testified before this Committee that were it not for the Act, state and local jurisdictions could force the elimination of billboards without the payment of just compensation through the simple expedient of delaying the date that they are taken. He also testified that almost all the courts have routinely sustained laws requiring the removal of billboards upon the expiration of such a fictional grace period.

The simple fact is that government cannot wish away lawfully erected billboards without paying for them anymore than it can take part of your front lawn for a road widening without paying you. One does not have to be a lawyer to know that such a notion is ludicrous and inherently unfair.

In essence, the just compensation provisions of the Highway Beautification Act implement the Fifth Amendment. At one time, this provision was controversial because some Courts did accord broad latitude to zoning actions, initiated under the guise of the

police power, which effectively destroyed the economic value of many land uses including billboards. But it is now quickly becoming clear that in enacting the Highway Beautification Act and other similar laws like the Uniform Relocation Assistance Act, the Congress was acting consistent with the law, and in advance of the Courts. Now the Courts have begun to confirm the wisdom of such legislation and the law seems to be shifting rapidly regarding the applicability of the Fifth Amendment to so-called regulatory takings which circumvent the just compensation requirement.

This began in 1987 when the U.S. Supreme Court issued several landmark Fifth Amendment decisions. These decisions held that government action at any level that deprives an owner of all beneficial use of his property is invalid unless just compensation is paid for the loss - even where the loss is only temporary. See First English Evangelical Lutheran Church of Glendale v. County of Los Angeles, 107 S.Ct.2378 (1987); Keystone Bituminous Coal Association v. De Benedictus, 107 S. Ct. 1232 (1987); Nollan v. California Coastal Commission, 107 S. Ct. 3141 (1987); Hodel v.

Irving, 107 S. Ct. 2076 (1987). The principles articulated by the Supreme Court have now been directly applied in one federal Circuit to test the validity of so-called amortization laws. In his testimony before this Committee, Mr. Mc Mahon cited a 1986 decision by the U.S. Court of Appeals for the Fourth Circuit in Naegele Outdoor Advertising v. City of Raleigh, 792 F2d. 1269 (1986), for the proposition that so-called amortization laws were presumptively valid on their face under the Fifth Amendment. He further stated that this result had the tacit approval of the Supreme Court by virtue of the Court's refusal to accept an appeal in that case. I am advised by lawyers, that it is Supreme Court doctrine that nothing can be inferred from a refusal to accept a case on appeal. But Mr. Mc Mahon was more than just being disingenuous about this procedural issue. He also failed to explain that within one year after issuing the Raleigh decision, the same Court of Appeals held in a second decision in Naegele Outdoor Advertising v. City of Durham, 844 F2d. 172 (1988), that in view of the Supreme Court's regulatory taking decisions, amortization could no longer be

presumed constitutional under the Fifth Amendment just compensation clause. Last week the Fourth Circuit again reaffirmed this principle. See No. 89-1005, _ F2d ,_ 1990. These are heartening developments. Nevertheless, the Courts have not yet caught up completely and the just compensation provisions of the Act are still essential to our industry to ensure fairness.

There is great confusion about the distinction between nonconforming and illegal signs. It is important to understand that the provisions of the Beautification Act apply to lawful "non-conforming" signs only and provide no compensation for the owner of an illegal sign. An illegal sign is simply a sign that has been constructed without governmental authorization. A nonconforming sign is a lawfully erected structure. "Nonconforming use" is not a special concept invented for billboards. Rather, the term is used to categorize any lawfully established land use that does not conform to a revision in zoning law enacted after the use was constructed. Nor is it novel for such uses to continue in existence for many years after they become nonconforming until

finally they are supplanted through redevelopment. As a result, most jurisdictions are a crazy-quilt of conforming and nonconforming uses. And where the immediate elimination of a nonconforming use is deemed important for some critical public policy reason, the governmental entity involved initiates an action to condemn the use and pay just compensation.

The just compensation provisions of the Beautification Act parallel this structure with respect to nonconforming billboards and provide for a seventy-five percent federal contribution towards expense of the removal. To date over 118,000 nonconforming signs have been removed in this manner. The OAAA has consistently supported funding of the Act for this purpose and we encourage the Committee to authorize at least five million dollars in funding in the current reauthorization, with the stipulation that the Department of Transportation establish policy priorities so that these funds will be used for the expedited removal of those nonconforming signs that are deemed most troublesome.

In recent years, the Highway Beautification Act has also

provided a context for the joint development by local jurisdictions and individual billboard companies of new innovative regulatory mechanisms predicated on the Act's framework. As jurisdictions come to recognize that they must pay for billboard removal, they have tended to prioritize their real concerns. Likewise, billboard companies have come to understand that the long term viability of their businesses cannot be predicated on the maintenance of nonconforming signs alone. As a result, a significant and growing number of jurisdictions throughout the country have resolved disputes informally through comprehensive agreements with local billboard companies including such localities as Montgomery County, Maryland and Portland, Oregon. This type of meaningful informal problem solving has been fostered by the Act.

Mr. Chairman, the simple fact is that the Highway Beautification Act has worked. Today, there are an estimated 710,000 fewer signs contiguous to controlled highways than there were in 1965. Unbridled proliferation has been checked and newly constructed billboards are confined to commercial and industrial

areas.

Billboards have been a primary communications medium virtually since the inception of this country. Billboards remain critical for the dissemination of commercial messages and political and non-commercial speech. Because outdoor advertising is particularly effective for projecting specific ideas and impressions in a succinct manner, and because it is lowest in cost of all the major mass communications media, outdoor advertising is recognized as an vital outlet for a broad spectrum of advertisers who wish to reach the public with their message. For many advertisers like those involved in tourism and related industries, billboards are simply not replaceable. Moreover, since each communications medium has unique and sharply different characteristics and limitations, outdoor advertising expands the opportunities for effective communication beyond the capabilities of other media.

These characteristics make outdoor advertising particularly important to local and regional advertisers. As a result, these smaller businesses represent approximately sixty-five percent of

the commercial advertising in the outdoor medium. Indeed, one of the principal categories of local businesses that rely heavily on outdoor advertising are other media including television and radio stations and newspapers. Local political advertisers rely heavily on billboards during election cycles. Advertising is also important to national advertisers who are increasingly confronted with the difficulty of disseminating their messages to an audience that has been fractured by a multiplicity of media alternatives.

Earlier testimony sought to inject the issue of cigarette advertising regulation into this Committees deliberations. Clearly, this complex and controversial problem is not a legislative issue in the context of the Highway Beautification Act. Nevertheless, I do not want to simply dismiss the issue and would like to put certain facts on the record.

As I indicated earlier, a nationwide average of only ten percent of our members signs disseminate cigarette advertising. There are no tricks or caveats in that statement; that is the number.

Moreover, members of the OAAA have acted in a responsible manner in the way they handle this category of advertisers. Many of our members have established exclusionary zones which preclude the location of advertising for tobacco and alcohol products within five hundred feet or within the intended view of schools and churches. Other members have developed locally based programs that disseminate original public interest messages regarding smoking or offer space to the national and local health organizations for dissemination of their messages. These programs are not new and precede the current controversy by many years. The OAAA's policy is to encourage such actions by its members to achieve a balance of information.

Recently, you may have read a news report regarding billboard advertising of cigarettes and alcoholic beverages in minority areas. Those stories actually underscore just how unrelated the smoking issues are to an assessment of the Highway Beautification Act. The billboards at issue in some of our major urban areas are referred to as "junior panels". These signs comprise a specialized

urban medium designed specifically for a pedestrian-oriented city environment. The are regulated solely by local laws and have been encouraged in some jurisdictions because of their smaller size. They fall completely outside the scope of the Beautification Act. It is clear that this area involves policy considerations unrelated to the Highway Beautification Act.

Finally, Mr. Chairman, outdoor advertisers are an important part of American life.

* We are a traditional advertising medium. We provide an accessible, cost-efficient and highly effective vehicle for businesses, small and large, to convey information about their products and services.
* We are a useful medium. We provide needed information to motorists and we help customers make decisions. We are an integral part of the information community.
* We are an entertaining medium. We challenge the creativity of advertisers with conditions of simplicity.
* We are a responsible medium. We have a 100 year history

providing important public service announcements to the communities we serve. Thousands of local organizations count on us each year.

* We are a controlled medium. We are subject to extensive regulation at the local, state and federal levels.

We believe in reasonable regulation and control. We are committed to working closely with government at all levels to accomplish this goal.

Of course, we accept the notion that billboards should not be everywhere. Decisions must be made in the basis of reality. Businesses have a right to promote their legal products and services. Citizens have a right to be informed.

When elected officials at all levels of government consider laws that may impact billboards, we only ask officials to consider reality, not hyperbole; consider practicality, not purity.

Thank you.

###

STATEMENT BY LOUIS G. NAPPI

CHAIRMAN

NATIONAL TRUCK WEIGHT

ADVISORY COUNCIL (NTWAC)

ON A

PROPOSAL FOR

SPECIALIZED HAULING VEHICLE (SHV) PERMITS

Before the House Public Works and Transportation
Subcommittee on Surface Transportation

April 24, 1990

SUMMARY OF NTWAC TESTIMONY:

In lieu of current Federal truck weight requirements, all states should be allowed to adopt voluntarily a program to issue permits for Specialized Hauling Vehicles (SHVs) to operate on the Interstate System. SHVs are unique trucks that have great difficulty in meeting federal truck weight standards, particularly the bridge formula, without sacrificing safety and/or productivity. The Special Permit Program proposed would enable SHVs to operate productively within the safety and maintenance design specifications of the Federal-Aid Highway system, while postings and route restrictions would assure protection of substandard structures.

Examples of SHVs include garbage trucks, ready-mix concrete mixers, dump trucks and roll-off container trailer combinations.

Accompanied by:

Larry S. Snowhite
Mintz, Levin, Cohn, Ferris, Glovsky & Popeo
Counsel to NTWAC

Specialized Hauling Vehicles (SHVs) Have Unique Problems In Complying with Federal Weight Laws

Current federal law limits the weights and axle spacings of trucks operating on the Interstate System, unless a state qualifies for an exemption under the grandfather clause. Trucks are, in effect, rewarded under current law with added allowable weight for increased number and spacing of axles. Application of this policy to trucks that are Specialized Hauling Vehicles (SHVs), however, is counterproductive because of the unique design and operating characteristics of SHVs.

All trucks are not the same. Specialized Hauling Vehicles (SHVs) are different from 18-wheel tractor-trailers and longer combination vehicles (LCVs). SHVs are trucks used for hauling heavy bulk materials. Typically, SHVs are garbage trucks, concrete mixers, dump trucks, and roll-off container trailer combinations. They carry such materials as garbage and wastes; scrap and recyclable materials; ready-mix concrete; and sand, gravel, and crushed stone. Nationwide, the number of trucks that would be considered to be SHVs is at most about 250,000, or fourteen percent of the largest weight classes (Classes 6, 7, and 8); the number of permits issued would be far fewer.

SHVs share certain common characteristics. SHVs have heavy tare, or empty, weights, attributable to structural design or specialized equipment installed on the vehicle for handling the heavy load; for example, when empty, a three-axle ready-mix concrete weighs 35,000 pounds. The materials hauled generally cannot be diverted to rail or other transport. SHVs generally operate for short distances and are empty for one direction in a round trip.

SHVs require short wheelbases in order to maneuver safely at construction sites, on city streets and alleys, at facilities with limited clearance, and at off-road locations. Because of their short wheelbases, the maximum legal weight for SHVs is usually determined by the federal bridge formula, rather than by gross weight limits.

Taking together the functionally-necessary characteristics of heavy tare weight and short wheelbase, the result is that SHVs cannot meet federal truck weight standards, particularly the bridge formula, without sacrificing safety and/or productivity. Users of specialized hauling vehicles cannot simply lengthen the wheelbase to take advantage of the greater gross weight permitted under the bridge formula for longer vehicles because of maneuverability and safety considerations; sometimes various devices are added to a vehicle simply to provide technical compliance with the bridge formula, but these "Rube Goldberg" devices may not be able to

installed on many vehicles, and where installed may raise serious safety and cost questions without necessarily assuring that the truck will be able to operate within the safety and maintenance design specifications of a highway. One consequence of complying with the bridge formula by operating at lower payloads is that a three axle SHV, which when empty weighs 30,000 to 35,000 pounds, can carry only 13,000 of payload.

Thus, current federal law in effect lessens the productivity of SHVs by virtue of their being what they are.

Additional consequences of requiring SHVs to operate within federal limits on the Interstate System include forcing SHVs to by-pass the Interstate System, traveling instead over state and local roads and bridges that are built to lower standards than those for the Interstate System; increased cost of manufacturing, purchasing, and operating a SHV; increased costs of transporting solid wastes for recycling and resource recovery; and increased costs of building roads and bridges. In addition, weight restrictions on SHVs require more trucks and more truck operations, which causes increased traffic congestion and idling time, all of which contribute to greater air pollution and fuel consumption.

What is NTWAC

The National Truck Weight Advisory Council (NTWAC) is a non-profit organization, founded in 1982, representing commercial industries involved in heavy hauling, such as construction, waste services, scrap iron, paper and forest products, bulk transportation, and building materials and supplies industries. Its members include national and state organizations and individual companies, such as the American Road and Transportation Builders Association (ARTBA), the National Solid Waste Management Association (NSWMA), the Institute of Scrap and Recycling Industries (ISRI), the National Ready Mixed Concrete Association (NRMCA), and the Dump Transport Industries Association (DTIA). Its objective is to obtain equitable and rational truck weight regulation for Specialized Hauling Vehicles.

States Should Be Authorized To Be Able To Adopt Voluntarily A Permit Program For Specialized Hauling Vehicles (SHVs) In Lieu Of Current Federal Requirements

A reasonable alternative is a special permit system for SHVs that could be adopted voluntarily by states without regard to grandfather clause status. It would allow SHVs to operate productively on the Interstate Highway System within the safety and maintenance design specifications of these highways. The NTWAC proposal incorporates a standard now used by several states in issuing permits; it is consistent with the AASHTO-specified basis for issuing permits to heavier-than-normal vehicles and with FHWA's basis for reporting structural deficiencies of bridges. As the nation appears ready to resume the task of rebuilding our infrastructure for the future, that task will be helped by a reasonable truck weight regulatory system for the trucks that will be used to build that infrastructure.

The National Truck Weight Advisory Council (NTWAC) has proposed that any state, regardless of grandfathered qualification may issue permits for SHVs that would enable their operation without regard to federal gross or axle weight limits or the bridge formula.

To qualify, the state SHV permit program would have to comply with the following basic elements:

(1) allow the operation of SHVs at gross and axle weights that do not exceed the lesser of (a) the manufacturer's certified gross vehicle rating or (b) 75 percent of the yield stress, i.e., the operating rating, calculated on an HS 20 bridge (if the SHV does not exceed 55 percent of the yield stress, i.e., the design rating, of an HS 20 bridge, no permit would be needed).

(2) restrict the routes over which permit vehicles may operate safely;

(3) post and/or limit the operation over bridges which cannot safely accommodate permit vehicles;

(4) establish a fee structure for permits that will be adequate to cover increases in highway agency costs and any administrative and enforcement costs resulting from permit vehicles; and

(5) establish an effective enforcement program which should include measures to assure safe operation and compliance with permit provisions.

How Is The Permit Weight Determined?

NTWAC's proposal for determining permit weight is based on the standard method of calculating the impact of a truck on a bridge, determined on the basis of the weight of a truck (called the "live load") on a bridge, and the load-bearing capacity of the bridge. Bridges are rated on the basis of safe levels of stress that may be imposed before the structure will undergo permanent deformation or "yield."

Rather than limiting allowable weights based on the bridge formula, the NTWAC proposal would allow a SHV to operate under a special permit provided it would not exceed the operating rating of a bridge. The operating rating is the standard that AASHTO recommends be used for issuing permits to heavier-than-normal vehicles. It also corresponds to FHWA's basis for reporting structural deficiencies of bridges. It can be easily calculated for any vehicle based on the number and spacing of axles and the vehicle's axle weights.

SHV permits would be based on the operating rating of an HS-20 bridge (bridges are rated on the basis of design loadings -- the higher the number, the greater the load that the bridge is designed to carry). The operating rating corresponds to 75 percent of the yield point for that bridge. The HS-20 design load was introduced in the early 1940's, and is the basis for Interstate System construction; fewer than 1,000 of the 50,000 bridges on the Interstate System have design loads of H-15 or less.

To determine a SHV's permit weight (which cannot exceed the manufacturer's GVW rating), its live load moment would be calculated and then plotted in comparison to the operating rating curve of an HS-20 bridge. If it does not exceed the operating rating, it could receive a permit. If the proposed permit weight would exceed the operating rating, either a permit would not be issued or the allowable permit weight would have to be reduced.

This is a relatively simple calculation, and provides a graphic illustration of whether the SHV would qualify for a permit; it is also a conservative permit criteria, as evidenced by the results on bridges designed to standards that exceed HS-20.

NTWAC has plotted on a graph the live load moment of a 3-axle, 16.5 wheelbase SHV weighing 80,000 pounds and a 5-axle, 36.5 foot wheelbase SHV weighing 110,000 pounds on a variety of bridges (Exhibit 1 (1)-(10)). The stress curves clearly demonstrate that the SHVs would not exceed operating ratings.

These weights are used for illustrative purposes, and do not necessarily represent weights that might be allowed by a state under a permit program. Permits for maximum allowable weights could be issued by a state based on the live load calculation of a specific truck, with the plotted curve carried in the permit vehicle along with the permit. States could also establish maximum permit weights for different classes of truck configurations, based on these live load calculations.

Impact of a SHV Permit Program on Bridges

Under the proposed permit program, SHVs operating on the Interstate Highway System would be exempt from the federal bridge formula. The NTWAC proposal would be a replacement for the bridge formula. Because it would assure that permit vehicles do not exceed the operating rating of an HS-20 bridge, it would be at least as protective and in some instances more protective of structures than is the current bridge formula. The bridge formula is overly cautious on weights for shorter vehicles and has no theoretical basis for the overstress criteria used to limit weights and configurations; it also allows some vehicles to exceed the operating ratings of some bridges.

It makes no sense to limit the design of tomorrow's trucks to the infrastructure and design standards of over half-a-century ago. If we were to compare our truck weight policy with that for planes, if we were to design today's planes by the runway design standards of the 1940's and 1950's, we would not have 747's or DC-10's. All planes would be the size of a DC 3 -- we would need six DC-3s to carry the same number of passengers as one 747 -- or else we would be requiring jumbo jets to have so many landing gears that they would weigh as much as the plane (as illustrated below).

FIGURE A

IF F.A.A. POLICIES WERE SIMILIAR TO THE K.H.W.A., AIRPLANE SIZE WOULD BE DICTATED BY THE RUNWAY DESIGN.

INSTEAD OF ONE - 747 (360 PASSENGERS)

WE WOULD HAVE SIX DC-3 SIZE AIRPLANES (60 PASSENGERS EACH)

TO DECREASE RUNWAY LOADINGS THIS MAY RESULT IN THE LANDING GEAR WEIGHING AS MUCH AS THE PAYLOAD, RESULTING IN THIS 747.

THE POINT IS THAT THE CURRENT ROADWAY DESIGN IS DICTATING THE SIZE AND EFFICIENCY OF VEHICLES WITHOUT REGARD TO THE SAFETY AND ECONOMICS INVOLVED.

A bridge's operating rating is itself a workable and protective regulatory standard for issuing SHV permits. A permit system based on operating ratings also enables a reduction in the number of SHVs that will be traveling over bridges. As previously shown, under the proposed permit system a three-axle SHV with a wheelbase of 16.5 feet can weigh 80,000 pounds -- of which 45,000 pounds is payload -- without exceeding the operating rating of HS-20 bridges. Under the current bridge formula, this same vehicle is limited to 48,000 pounds -- of which only 13,000 pounds is payload. Thus, under the NTWAC proposal, one SHV permit truck would be able to carry the same payload that would otherwise require almost four trucks to carry.

Setting permits based on the operating rating would, in practice, provide a significant margin of safety, even for those bridges that no longer meet an HS-20 standard. A recent study by the National Solid Waste Management Association found that only two out of 32 three-axle refuse trucks currently on the market would impose loadings above the design rating (55 percent of yield) on an HS-20 bridge, and neither of these would exceed the operating rating (75 percent of yield). Although the operating rating is an absolute upper limit for a permit vehicle, in practice the actual weights of permit vehicles are likely to be less. This is confirmed by New York State's experience. The State, established a Permanent Advisory Committee on Truck Weights to evaluate its permit program, which was based on the NTWAC proposal. The Committee submitted a Final Report to the Governor and Legislature (Exhibit 2) reviewing the program's operation, finding that the average permit vehicle carried 75 percent of the maximum allowable payload under the state's permit system. The Committee's consultant calculated that the permit program's annual bridge fatigue damage was $23 thousand, while the annualized replacement cost for weight-restricted bridges was $18.6 million. Consider these costs -- which cannot be allocated just to SHVs -- against SHV permit fees of approximately $10 million annually, and a penalty structure that ranges up to $7,000 and under which a permit-holder exceeding the permit weight by as little as one pound can be fined $2,700.

Recognizing that there may be some bridges that might not accommodate a permit vehicle, the SHV permit program calls for posting and route restrictions and priority replacement for deficient bridges (e.g., H-15). Over half the states now post bridges based on operating ratings. Based on experience to date, it can be anticipated that states would choose to post (rather than replace) many bridges, particularly on low volume routes, and that route restrictions also would significantly reduce bridge cost impacts. The small number of permit vehicles involved makes this a very practicable strategy.

38-253 O—91——60

Any analysis of bridge prospective bridge impacts must also factor in the estimates that 5,000-8,000 bridges will be replaced and upgraded annually, probably to HS-25 or greater. If implemented, the bridge impacts attributable to an SHV permit program would be mitigated further.

Finally, non-Interstate System bridges would benefit in states that allow permit vehicles to shift to the better-designed Interstate System.

Impact of a SHV Permit Program on Pavements

Pavement impacts attributable to SHVs and to any truck are a matter of continuing controversy that will not be easily resolved, nor are we trying to do so here. But studies have been done that confirm that the NTWAC permit proposal would not have an adverse effect on pavements. For example, New York's Permanent Advisory Committee concluded that the annual cost of pavement damage attributable to the permit program was small, in particular because of the small proportion of permit vehicles to the over-all vehicle population. The Committee's contractor calculated, using the conventional ESAL equivalency models, that the annual cost for pavements was $500,000.

Evaluating pavement impacts requires consideration of the substitution effect of a permit program. A single SHV operating under a permit can carry the same payload that two, three, or even four non-permit trucks would otherwise be required to carry. It is not simply comparing the effect of one 48,000 pound truck versus one 80,000 pound truck on the road -- the true comparison is between four trucks each weighing 48,000 pounds versus one truck weighing 80,000 pounds to carry the identical payload. It is also a comparison of the impacts on the return trip, after the payload is delivered, comparing four empty trucks each weighing 35,000 pounds to one permit truck weighing 35,000 pounds. NTWAC believes that its proposed permit program produces the more desirable outcome.

A fresh look at the underpinnings of the pavement damage models that make up the basis for the "conventional wisdom" also provides an opportunity to raise significant questions.

As seen by the shape of the curves on Figure B, the top logarithmic graph of thickness versus axle load applications from the AASHTO road test seems to indicate that there is an increasing need for extra pavement thickness after the first million applications. This is the apparent basis for the fourth-power rule, which is the basis for stating that pavement damage increases by a factor of four for each 1,000 pounds of axle load. It also appears that 75 percent of the graph was the result of testing and only 25 percent was extrapolated.

Figure 117. Rigid pavement performance curves from Road Test equation, experiment design 1, for $p = 1.5$.

(From "The AASHO Road Test", Report 5 Pavement Research)

The standard plot of the same data indicates the opposite. In fact, only 10 percent of the graph was obtained by actual test -- 90 percent was extrapolated. The curves clearly start to level off after the first 100,000 load applications, not get steeper. They do not follow a fourth-power relationship. Also, the curves become parallel after the first 100,000 applications, i.e., repeated numbers of applications of any load will require the same additional thickness of pavement. The conclusion is that most of the thickness index is required in the first 100,000 applications, and that load is not a big factor thereafter.

The shape of the graphs are correct, but the quantitative aspects are not correct when applied to failure by loading alone. Therefore, the AASHTO curves demonstrate that if the pavement is going to fail due to loads, it will fail immediately. If it does not fail before the 100,000 applications, there is no fourth-power relationship of weight to damage.

Impact of a SHV Permit Program on Enforcement

NTWAC recommends strong enforcement tied to its recommended permit program, believing that fair enforcement of reasonable weight limits provides a level playing field and an incentive to industry to comply and engage in self-policing in order to retain its permit program. NTWAC has consistently endorsed such enforcement-related measures as key elements of the proposed SHV permit system.

The current enforcement system is not working. The proposed SHV permit program would be a significant improvement over the status quo. Experience in grandfathered states shows a permit system with reasonable weights increased compliance and eliminated "spikes" of extremely overweight vehicles.

A SHV permit system is simpler to enforce than the current calculations needed to determine bridge formula compliance. It would have greater legitimacy and have industry support in order to assure that the permit program would be continued; truckers would be able to operate at reasonable weights and therefore would not have the incentive to operate at grossly overweight and unsafe loadings. Up-front fees are more equitable than after-the-fact fines and less subject to enforcement discretion, and can be earmarked, as New York does, to greater enforcement.

Penalities for repeat and serious offenses can be greater under a permit system and be given more credibility for judicial enforcement, and permits can be revoked for repeated

or severe violations. States can also require safety-related improvements as a condition of a permit. Limited enforcement resources can be devoted to more pressing priorities, such as vehicle safety inspection and substance abuse.

Impact of a SHV Permit Program on Safety

An SHV permit program will also result in safety benefits. It is also important to stress that an SHV, when properly designed, is an inherently safe vehicle that must meet stringent NHTSA as well as industry requirements. Heaviness does not equate with risk. Again citing the Final Report to the Governor and Legislature of the New York State Permanent Advisory Committee on Truck Weights, its "major finding is that greater accident severity and involvement for heavy trucks (gross vehicle weight greater than 26,000 lbs.) cannot be conclusively attributed to vehicle weight. ... No evidence could be found to suggest that the safety of the traveling public is compromised by permit trucks." (emphasis added)

To comply with the braking requirements of the Federal Motor Carrier Safety Regulations, all trucks must meet the stopping distances set forth in 49 C.F.R. Part 571.21. Braking performance and stopping distances must be achieved regardless of Gross Vehicle Weight Rating. Safety as measured by FMVSS 121 is a function of truck specification and equipment application, rather than weight. The critical factor is ensuring that all trucks, and heavy trucks in particular, be operated in accordance with their certification weight ratings. An SHV program with increased inspection and enforcement and sufficiently punitive measures for those who operate in overweight conditions would enhance safety by eliminating unsafe configurations from the highways, particularly aftermarket modifications to add axles that are motivated solely to obtain more bridge formula weight, rather than from sound specification principles.

Simply increasing wheelbase to achieve greater bridge formula allowances also adversely affects safety in SHV because of the need for manueverability and stability that is a basic operational constraint shared by this class, either because of tight quarters or the need to keep tipping moments to a minimum in off-road dump-type unloading. An increase in wheelbase from 15.5 feet (47,000 lbs. bridge formula) on a three-axle truck to 22.5 feet (52,750 lbs. bridge formula) would result in a degradation in manueverability because of a 30% larger turning radius. Such a configuration, which would be virtually unusable in many construction and refuse operations would not even allow a truck to be loaded to the standard federal axle limits.

In addition to assuring safer vehicles, a safety benefit of a SHV permit program results from the substantial reduction in the number of vehicles and vehicle miles. At an average total cost per motor vehicle accident of approximately $3,700 (from the 1989 edition of the National Safety Council's Accident Facts), and a rate of 15.23 accidents per million miles driven for trucks, as cited in that same publication, safety-related savings of $56,000 per million miles not driven could result from a SHV permit program.

The driver must also be factored into the safety equation. SHVs require highly skilled drivers who must have knowledge of materials handling, on- and off-road driving skills, and frequently the ability to operate complex power equipment that is an integral part of many of these trucks. In an era that is predicting severe shortages in qualified drivers, SHV operators -- particularly in the Northeast -- are facing significant challenges in locating, recruiting, and training qualified commercial drivers. A SHV permit system provides an additional means to assure that SHVs are operated by qualified drivers, while helping to mitigate the supply problem.

Impact of a SHV Permit Program on the Environment

The improved productivity of SHVs operating under a permit program, and the reduction in the number of vehicles and vehicle miles traveled, have a positive environmental impact.

A key beneficiary of a permit program are such waste management programs as trash collection, recycling, resource recovery, and Superfund cleanups, because the costs of transporting materials would be reduced. Transfer stations could be more efficiently utilized. Diversion of SHVs from local roads onto the Interstate System could even reduce local opposition to regional waste management programs.

Air pollution is reduced under the proposed permit program because of fewer vehicles and also because of more efficient operations and therefore less waiting time, factors that are particularly important in urban areas with severe automobile-related Clean Air Act non-attainment problems. A recent estimate of the impact of congestion is that in 1987 the cost of congestion (including extra fuel, increased accidents, and time lost) in the 25 largest metropolitan areas was about $42 billion.

Net environmental impacts is most dramatically affected in changing the required number of SHV's because of the lower payload ratio to total vehicle weight (because these trucks are

heavier empty than the general truck fleet) and the operating profile, which is typified by SHV's running 50% or more of its total miles in an empty condition. Considerable energy is consumed in moving the base vehicle, with its integral operating equipment, such as mixers, lifts, compactors, roll-off containers, etc. This can be illustrated by an example, based on a 1984 fuel usage study done by the National Solid Wastes Management Association.

Assume that an SHV permit truck with an empty weight of 34,000 lbs. has a payload capacity of 30,000 lbs. at a certified GVWR of 64,000 lbs. Under the federal bridge formula, the allowable gross weight would be 49,000 lbs. Since little weight savings can be gained in a downsized truck (the basic operating equipment is the same), perhaps a 15% increase in fuel economy and an empty weight reduction of 1000 lbs. could be expected. The result would be that two trucks would now be required to move the same payload the same distance. Since additional fuel (37% in refuse vehicles) is required to operate power takeoff equipment (PTO), the relative environmental impact can be estimated as follows for moving 30,000 lbs. of payload 50 miles (100 miles round trip).

Basic Fuel Used	26.3 gal.	44.7 gal.
PTO Fuel	9.4 gal.	16.5 gal.
Total Fuel	35.7 gal.	61.2 gal.
Fuel/lb. payload	.0012 gal.	.0020 gal.

Since fuel usage is related directly to brake horsepower required, the total environmental impact in air emissions would increase by 71.4%. Emissions per pound of payload moved would increase by 66.6%, far offsetting any efficiency gains from a slightly smaller truck.

Impact of a SHV Permit Program on Productivity

Once any truck is allowed on the road, a trade-off is implicit between productivity benefits and negative bridge and pavement impacts. The NTWAC proposal has always acknowledged that there will be costs associated with a special permit program. Making the trade-off on the side of the NTWAC proposal is, we believe, justified. First, SHVs have a very real problem complying with federal weight requirements while operating safely and productively to carry out the jobs that they were designed to do, and, second, there is a substantial productivity, safety, and environmental benefit to the public from a SHV permit program that outweighs pavement and bridge impacts. These productivity benefits can be used to reduce the costs of road and bridge construction, increase resources for enforcement, and provide funds for program administration.

In addition to the benefits in lower operating costs from reduced miles traveled for SHVs operating under a permit system, there are benefits to SHV owners from reduced operating costs and from being able to utilize existing equipment more efficiently. Because SHVs have a heavy tare weight that reduces the allowable payload under current federal weight restrictions, any increase in allowable weight will be in the payload. A permit program could enable the typical three-axle ready-mix concrete truck already discussed to increase its payload from 13,000 pounds to 45,000 pounds. Therefore, it will take fewer SHVs to carry the same payload; fewer loading facilities; less lost time on the job; less fuel; and reduced loading and off-loading time. As previously pointed out, improved productivity also results in improved air quality and fewer accidents.

Governments -- thereby the taxpayer -- paying for infrastructure will benefit from reduced transportation costs for the materials used in bridge and pavement construction, which should make scarce construction dollars go further in building and maintaining roads and bridges. Increased revenues from permit vehicles paying permit fees should be dedicated to permit administration and to enforcement (providing a source of funds that is more reliable than penalties), as well as for bridge and road construction and maintenance. NTWAC is not asking for a free ride -- we know that there will be costs, as well as increased enforcement, with our permit proposal; nevertheless, we are more than willing to accept them if we can operate productively and legally.

Again, the program we are proposing is based on the actual practice of states. The trucks we are proposing to be legal nationwide are legal in countless states now, both on and off the Interstate System. The experience of those states has been positive. The New York State Permanent Advisory Committee on Truck Weights concluded that "There are significant net positive benefits to the State's economy associated with Overweight Divisible Load Permit Program." The benefits analysis found that "the annual operating costs of permitted trucks are reduced by nearly $690 million from what they would be if forced to operate under the current federal limits. ... The construction industry is most benefited by the permit program, with savings of over $400 million."

In some cases, operators and manufacturers of specialized hauling vehicles have adopted artificial devices as a means to improve productivity while complying with the letter of the bridge formula. Examples include lift axles that are lowered only when the vehicle is weighed by enforcement officials and dummy axles that carry can increase legal weight

under the bridge formula by over 5,000 pounds even though they carry very little weight themselves, and "pups" that extend behind a truck without carrying any load but add axles that count for the bridge formula. These devices increase the cost of the truck by as much as ten percent, frequently serve no useful purpose other than technical compliance with the bridge formula, and can compromise vehicle safety and handling. The NTWAC permit proposal would enable manufacturers to produce a vehicle that meets a simple performance standard: it shall not, when fully loaded to the lesser of the maximum allowable state limits and the manufacturer' GVW rating, exceed the operating rating on an HS 20 bridge.

THE NTWAC PROPOSAL PROVIDES FOR STATE FLEXIBILITY

SHVs, as demonstrated, are unique trucks with unique problems and needs. They are involved primarily in local, rather than long-distance, transportation. States would not be required to adopt a SHV permit program; instead, recognizing the essentially local character of SHVs, states could define a SHV permit program based on their own needs, infrastructure conditions, and financial resources, within national minimum standards. The state primacy and flexibility entailed in the NTWAC proposal is consistent with the concept of federalism and with federal law, specifically 23 U.S.C. §145, which provides that Congress has established a federally assisted state highway program. Already half the states allow single unit trucks to operate in excess of federal standards. Several states have grandfather status that enables them to allow SHVs to operate on Interstate highways without limiting them to the federal bridge formula or to federal gross and axle weight limits. The NTWAC proposal would enable any state, without regard to grandfather status, to benefit from an SHV permit program.

NTWAC proposes, accordingly, that the definition of a SHV, the weight and configuration limitations that might be set, routing and posting restrictions, permit fees and penalties, all would be left up to the state should it decide to adopt a permit program. Congress would protect its investment in the federal-aid system by establishing minimum requirements as proposed and by assuring that these standards are complied with by the state.

States should be able to make the trade-off between, on the one hand the substantial productivity, safety, and environmental benefits, and, on the other, the costs fairly attributable to a SHV permit program, based on a balancing of the merits of the issue, not on the happenstance of the grandfather clause claims.

CONCLUSION

The benefits of the NTWAC Permit Proposal for Specialized Hauling Vehicles (SHVs) would include:

To the Public:

- A SHV permit program means fewer trucks to carry the same payload, which means lower costs, fewer accidents, less air pollution, less noise pollution, less congestion, facilitation of resource recovery and recycling, and diversion of heavy trucks onto the Interstate System from local roads.

To Government:

- Allowing reasonable weights based on bridge operating ratings, coupled with posting/route restrictions of substandard bridges, will enable SHVs to operate productively within the safety and maintenance design specifications of the Interstate System and much of the federal-aid system. Non-Interstate roads and bridges would benefit from the diversion of heavier trucks to the Interstate, which is better designed to accommodate them.

- Bridge and road construction and maintenance costs would be reduced because the costs of transporting construction materials would be lower if productive permit vehicles are allowed; similar benefits would be realized for Superfund-type cleanup operations. Up-front permit fees and severe monetary penalties for violators can be earmarked for new construction, enforcement, and administration.

- A reasonable permit system frees up enforcement personnel to comply with pressing federal requirements, such as safety and drug and alcohol monitoring programs.

To Industry:

- SHVs could carry productive payloads with existing equipment, without the added costs and potential risks of retrofitting existing trucks if even feasible, or buying new custom trucks with added axles, pups, boosters or other devices with the sole purpose of technical compliance with the bridge formula to enable increased payload.

- Operating costs would go down. In New York State, a recent study of its permit system found that "the annual operating costs of permitted trucks are reduced by

> nearly $690 million from what they would be forced to operate under the current federal limits....The construction industry is most benefited by the permit program, with savings of over $400 million."

NTWAC has made what we believe to be a constructive and responsible proposal that would apply to a very small and limited class of vehicles, in lieu of the current federal truck weight requirements. NTWAC requests that the Congress authorize any state to be able to adopt a permit program for Specialized Hauling Vehicles, regardless of grandfather clause status, so long as it meets minimum federal standards to assure protection of pavements and bridges, safety, and enforcement. The permit program proposed by the National Truck Weight Advisory Council meets this criteria and should serve as the foundation for Congress' effort.

Final Report
To the Governor and Legislature
From the Permanent Advisory Committee
On Truck Weights

IV. RESEARCH INTO THE IMPACT OF THE LEGISLATION

A. Background

One of the Committee's primary assignments was to make recommendations regarding the continuation of the permit provisions of the law to the Governor and Legislature by January 1, 1988. The legislation directed the Committee to consider the relative costs and benefits of investment in increased load capacity for the bridges and highways of the State, new developments in the design of trucks, their operational safety and economics, the manner in which they affect the safety of the traveling public, the useful life of bridges and highways, the protection of the highways, and other such matters that would affect the use, operation and maintenance of the highways in the State. The Committee decided to engage outside consulting assistance on two independent research efforts in order to comply with the requirements of the legislation.

Department of Transportation staff prepared requests for proposals (RFPs) on behalf of the Committee. The RFPs described the tasks to be accomplished to permit the Permanent Advisory Committee to respond to the legislative requirement. Each project was advertised at a fixed fee of $150,000. The RFPs were sent to more than 400 consulting firms previously indicating competence in at least one of nine pertinent experience areas, and to all public and private New York State colleges and universities offering a four-year engineering program. a pre-proposal conference was held to provide an opportunity for prospective contractors to question Department staff on the details of the proposed work.
